When mysteriously lame cows do not react to the tuberculin test the likelihood of "self-robbery" or resorption of lime salts should be considered as a possible explanation of the trouble. That, often, is the true cause, especially in pregnant cows, and immediate provision of needed minerals and a generous balanced ration, including legume hays, will be likely to prove remedial. When the lameness follows a difficult labor and the cow is not a reactor and has been correctly and completely fed, the possibility of an internal injury should be considered and a careful exa tion made. In one case such was for two months treated fo lameness, failed to recover, and Post-mortem examination dis an internal injury as the cause

Drying Up Cow

HOARD'S DAIRYMAN:—The expressed by J. R. C. Jones of tralia in his comment on page January 10 issue regarding "D Up a Cow," are radically dif from those that I have formed my years of dairy experience.

While I was in charge of a consisting of forty-five head of it was my practice to dry cattle the following manner:

First, I gradually reduced the ration; and after a few days t entirely away until after the co dry.

Second, I lessened the milkin about the third day started m only once, and then did not str the milk out of the udder. Aft other few days, I commenced m every other day, so that in ten or two weeks the cow was abso dry.

Every month I prepared son or seven cattle for parturition encountered very little trouble ing the above method. It is co knowledge among farm hands the best way to dry up a cow neglecting to milk her clean. should take advantage of the ance that Nature offers us in th spect. If we leave a little milk udder at one milking, Nature ge ly provides that at the next m the quantity will be reduced—

When Bag Balm comes into the cow out goes all the annoying, costly troub the udder and teats. No more loss of through nervous, restless cows.

Bag Balm heals, with marvelous spe cuts, chaps, cracked teats, teats stepp or bruised in any way. The healing is us effected between milkings. Just a dab o Balm assures the complete rebuilding c injured tissues. For Caked Bag, Bun Cow Pox—any inflammation or conge Bag Balm gives prompt, effective relie

Bag Balm is clean, sanitary, inexpens and cannot taint the milk. Big 10-o package, 60c, at general stores, feed de and druggists. If your dealer is not plied, order from us, giving us his n Booklet, "Dairy Wrinkles," sent free.

WONDERFUL country calls you! A country where neither biting blizzards nor sultry summers ever visit; where flowers bloom, birds sing, crops grow, and men enjoy life from June to June. God gave New Bern a gentle sea breeze to keep away the heat of summer, the tepid Gulf Stream to ward off the icy hand of winter, and set it amid some of the most enchanting scenery on the Atlantic seaboard. Rich in natural resources, basking in the light of historical significance, offering unusual agricultural advantages, the New Bern section is open to the man who can appreciate its opportunities and who wants to really LIVE.

Advantages:

Mild winters, cool summers. Fertile soil, pure water. Year 'round grazing for cattle. Wealth of good roads and waterways. Two good competing railroads. Splendid market for Dairy and Trucking products. Low-priced lands. Fine Schools, Churches, and neighbors who get the whole story. Write for it now, mention Hoard's Dairyman.

the milk is not used, there is no need for it; then why go on producing it.

I shall welcome any criticisms on the above opinion.

Connecticut. W. SHORR.

For Self-sucking Cows

HOARD'S DAIRYMAN:—I note in a recent issue an inquiry for a method of preventing self-sucking in cows. Some years ago you published a method which I have since used, and it always works well although it is horribly disappointing to the cows.

Cut a piece of ¼-inch gas pipe long enough to make a bit for the cow, and drill holes in the ends for the wires to which attach the strap to go over the head. Then drill 6 or 8 small holes in the pipe and between the straps, half at right angles to the others. The cow will suck air and will soon quit sucking while she wears the bit. It is well to run a wire through the pipe occasionally to keep the holes effective, although I have never seen indications of sucking while the bit was worn. This does not interfere with eating or drinking, and is absolutely effective with our cattle.

Minnesota. F. E. MARSH.

For Choked Cattle

HOARD'S DAIRYMAN:—I think I have a better remedy for choked cattle than any given in the Jan. 25th issue of Hoard's Dairyman. I take a wire hoop, or any stiff wire will answer, and bend it around a round stick, making a loop as large as will readily slip down a cow's gullet, twisting the rest of the wire tight for a handle. Crowd the stoppage up and slip the loop down throat until you feel the loop slip over stoppage; then pull out. Ninety-nine times out of 100 you will have it the first time.

Connecticut. S. D. NEWELL.

Enlarged Hock Joint

Can you tell me any remedy for the enlargement on the hock of a cow caused by lying down on the stable floor. Sometimes it comes on the knee and dairymen call it "Big Knee." While they are bedded down with straw it becomes displaced so that they come in contact with the floor, which is wood.

Manette, Wash. H. K.

Enlargement of the hock, if the swelling is soft, is caused by distension of the joint capsule with synovia (joint oil). When the knee is swollen from bruising the liquid present in the sac or cyst is serum, not joint-oil, and it may be liberated by lancing. The hock joint cannot safely be treated in that way. Move the cow into a well bedded pen or box stall where bruising will be less likely to occur. Twice daily rub into the swelling some 10 per cent iodine vascogen or petrogen to stimulate resorption of the fluid. That may do some good, but such synovial distensions tend to persist, despite treatment.

Blood in Milk

I have a pure-bred Holstein heifer that has been fresh six months and for the last month she has been giving bloody milk out of one quarter. Her udder doesn't seem to be inflamed; it's just normal, but the milk is full of clots and at times I could hardly get the milk out,

Thornton, Idaho. H. E. S.

A growth in the teat probably bleeds from irritation at milking time. By rolling the teat between the thumb and fingers you may be able to feel the growth. If it is just inside the outer opening of the teat the veterinarian can remove it by means of a teat tumor extractor (Hug's) or by amputating a small portion of the tip of the teat and then reaming out the growth with a small scalpel. After the operation apply a little yellow oxide of mercury ointment (ophthalmia) 2 or 3 times daily. If the growth is located high it would be best to let a calf nurse or to dry off the secretion of milk in that quarter of the udder.

Breeding Cow

We have a valuable show cow that is due to calve shortly. Since we would like to have her heavy in calf for the shows next fall, do you think it would be O. K. to breed her again the first time she comes in heat?

Barneveld, N. Y. W. T. McR.

As you have a special reason for wishing to have the cow become pregnant as soon as possible after calving, she should be bred the first time she comes in heat. That will probably be about 28 days after calving. Ordinarily, it is better not to breed a cow so soon after calving.

Lice on Cattle

Please give me a remedy for lice on cattle.

Worthington, Minn. A. O. F.

Freshly powdered sabadilla and pyrethrum are effective against lice of cattle. Use a mixture of one part of each of them combined with three parts of flowers of sulphur. Dust freely upon infested parts and then blanket cow. Groom thoroughly the following day and repeat the treatment as often as is seen to be necessary. Grooming the skin with a brush dipped in linseed oil is also effective, but it fouls the coat.

"Frosted" Teats

Kindly tell me what is the best remedy for frosted teats.

Garrison, Mont. A. M.

Severe freezing of the teats may cause sloughing of the affected parts and in that case the cow will have to be fitted for the butcher. Twice daily apply a mixture of ½ part of pure turpentine, 1½ parts of compound tincture of benzoin or balsam of Peru, and 8 parts of lanolin (sheep's-wool fat), or vaseline.

A Decade of Co-operative Dairy Endeavor

(Continued from page 175)

tion of price and production statistics. In the matter of intelligent price determination, this information has been most valuable.

"Orderly production," says President Allebach, "is most generally conceded to be the only basis upon which an orderly marketing plan can be built."

The further development of the selling plan, the main feature of which is balanced supply and demand, was the program in 1926. Emphasis has been placed on the elimination of seasonal changes in the supply.

"The production of surplus in the whole territory has averaged less than ten per cent during the first nine months of 1926. It shows that farmers can regulate their supply and by so doing can have a ready and stable market during the entire year," says Mr. Allebach.

In summarizing the work, Mr. Allebach stated that "the association during the ten years of its existence has returned to its members a price as satisfactory as that of any similar marketing association and at the same time has co-operated in economic and business practices that enable the consumers to purchase milk in the Philadelphia Milk Shed at a consistently lower price than in any other metropolitan area in the East.

"We view the future with confidence, realizing that we are in a position to market our members' milk to their great advantage, to surround the marketing of our members' milk with the maximum amount of protection with regard to proper weighing and testing of milk consistent with good economy. We are in a position to speak with a united voice in legislative and other matters dealing with the welfare of the dairy industry. We are confident and determined that dairying in this district shall be an occupation offering those who engage in it a standard of living and advantages equal to that enjoyed by any other group in society.

No More troubles at Calving

STOP dreading the time when your cows freshen! The troubles you've looked upon in the past as part of the hazard of dairying are no longer a menace to your profits. Dairymen without number are now using Kow-Kare at freshening because of its marvelous invigorating action on the reproductive organs.

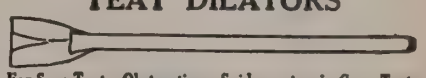
Kow-Kare is a concentrated tonic-medicine that has no other function than the building up of the digestive and genital organs. By using this famous cow medicine with the feed for two or three weeks before and after freshening you are assured a healthy cow—and a strong, vigorous calf. Retained Afterbirth and the other disorders you have learned to dread have no terrors for you if Kow-Kare is your reliance.

Kow-Kare, used sparingly with the feed helps your cows fill the pail under the most adverse conditions of winter feeding—when dry, heavy feeds put an added burden on digestion and assimilation. Try Kow-Kare when troubled with Barrenness, Retained Afterbirth, Abortion, Bunches, Scours, Lost Appetite, etc. Its health-building action will give you a convincing demonstration of its money value to you in the business of dairying.

Dairy Asso. Co., Inc., Lyndonville, Vt.

Makers of Kow-Kare, Bag Balm, Grange Garget Remedy, American Horse Tonic, etc.

KOW-KARE
FAMOUS CONDITIONER OF MILCH COWS



Feed dealers, general stores, druggists have Kow-Kare — $1.25 and 65c sizes (six large cans, $6.25). Full directions on the can. Mail orders sent postpaid if your dealer is not supplied.

MOORE BROS., Dept. H. ALBANY, N. Y.

The Best Railway Service in History

The freight service rendered by the railways in 1926 was the best in history.

Traffic was the largest ever handled, the increase over the previous high record being the greatest that has occurred in any year since 1917.

The movement of this enormous traffic presented many difficult problems, but was accomplished without the delays and "car shortages" that used to cause farmers and other shippers such trouble and losses.

This great improvement in transportation service has been made possible by the investment of *five billion dollars* of new capital in the railways since they were returned to private operation in 1920. This new capital has provided 15,000 larger and more powerful locomotives, and 830,000 larger and better freight cars. It has added tracks, enlarged terminals and made many other kinds of improvements.

The average return earned by all the western railways on the total investment in their properties in 1926 was only 4.6 per cent. During the last five years the return earned by them has averaged only 3.7 per cent.

The large investment of capital in the railways within recent years has been made with the hope and expectation that, in the long run, they would be allowed to earn, on the average, a fair return. It cannot be continued unless a fair return is earned.

If the present good service is to be maintained the facilities of the railways must continue to be enlarged and improved. Good and adequate freight service is of vital importance to farmers and all other producers and shippers.

Mention Hoard's Dairyman to Your Dealer—It Helps Us

The Feeding of Dairy Cows

(Continued from page 176)

variety of feeds into a ration that will meet the requirements of a given cow. It is enough to set down the steps necessary in fitting the ration to the cow. These steps are as follows: (1) determine how much roughage and how much concentrates an average cow in the herd needs, using the simple rule for quantity feeding as given in article 4 and also repeated in this article; (2) set down the per cent of digestible protein needed in the concentrates mixture to properly balance the ration with the roughages to be used as, for example, silage and alfalfa hay require a mixture containing from 10 to 12 per cent of digestible protein; silage and red clover hay, 13 to 14 per cent; silage and mixed hay, 16 to 17 per cent; silage and timothy hay, 18 to 20 per cent; legume hay alone about 10 per cent; carbonaceous roughage alone, 18 to 20 per cent; (3) mix the home grown feeds and such supplementary feeds as are necessary in such proportion as to contain the right percentage of digestible protein for the roughage it is to be fed with; (4) determine the amount of digestible protein and total digestible nutrients in the amount of roughage and concentrates to be fed; (5) calculate the requirements of the average cow according to the Haecker feeding standard; (6) compare the nutrients in the ration with the requirements as indicated by the feeding standard; (7) make such changes in the proportions or kinds of concentrates as are necessary to make the nutrients in the ration check fairly closely with the feeding standard requirements.

The details for each of these steps are all given in articles 4, 5, and 6 of the series.

Remember that a correct balance or proportion of nutrients is not the only factor in a good ration. The ration *must* be palatable; it should contain some succulent feed; it should be reasonably bulky; it *must not* injure the cow nor impart undesirable flavors or odors to the milk; it *must* be cheap enough to be fed to good cows and leave enough margin to cover other costs and a reasonable profit.

A well balanced ration is not the only factor that has to do with making the most money from a given amount of feed when fed to cows. Some of the other more important factors are: (1) eliminating scrub cows; (2) producing a combination of crops best suited to the needs of the herd to the end that milk production is measured in terms of amount per acre of crops grown for feeding purposes; (3) having cows in good condition when they calve; (4) being regular in feeding and milking; (5) making cows comfortable; (6) having the barn conveniently arranged and the feeds handy to get at; (7) keeping the herd free from disease.

It is difficult to realize the needs of a herd of cows in winter quarters for plenty of good air, because one cannot see the air a cow breathes nor the by-products of respiration which are exhaled. It is also difficult to measure the influence that a lack of plenty of good air has on the production and health of cows. In spite of this we know that a properly ventilated barn is a better place for cows to work in than a poorly ventilated one. Good air is important.

Supplying water to a herd of cows is largely a matter of making it convenient for them to drink as often as they like and of making the supply such that they will want to drink all they need. Dairy cows in production require more water than any other class of live stock. Anything that causes cows to get or drink less water than they need is just as bad as cutting down the feed. Water is comparatively cheap; feed costs more; don't cut down on water.

The mineral needs of dairy cows and the conditions under which they are best supplied and utilized are not fully understood. It is thought that the mineral needs of cows of average production are met when liberal amounts of legume hay are included in the ration, together with salt.

The rations of cows whose production is more than average should have the ration supplemented with mineral substances containing sodium and chlorine as in common salt, with calcium and phosphorus as in bone meal and with calcium as in finely ground limestone. Equal parts by weight of these mineral carriers make a good mixture. In addition to this, cows should have a dry or rest period during which time they are so fed as to bring them up to good condition for calving time.

Two or three vitamins are of some importance in feeding cows. Vitamin A which promotes growth in young animals and effects a certain measure of health protection in adults, is found in yellow corn, in silage, in green pasture grass, and in legume hay that has not been considerably exposed to direct sunshine. It is thought this vitamin is usually present in sufficient amount to meet the needs of the herd.

Vitamin D which promotes the assimilation of bone forming minerals (calcium and phosphorus) is found in green pasture grass, in legume hay that has received considerable direct sunshine, in butterfat, in cod liver oil, and is also known to be influenced by direct sunshine. Under certain conditions, as in closely housed cattle during winter and with feed low in this vitamin, there may be detrimental effects due to a lack of this vitamin. More knowledge concerning the sources of this vitamin and its effects in cow nutrition is needed before a more positive statement can be made.

A fifth vitamin, known as X temporarily and not yet definitely named has something to do with reproduction of young. More knowledge is needed concerning this factor in nutrition.

Dairymen need not be unduly concerned about vitamins for cows as long as they feed good rations and properly manage their cows. They may well observe care until further facts are discovered about the source and functions of these unseen influences.

This series is concluded with the opening statement of the first article: "Anything that has to do with converting the feeds grown on dairy farms and those purchased into higher values and greater net returns strikes at the very heart of the business of dairying." To this we would add, "He who feeds right will get the most milk and he who gets the most milk will profit thereby, provided he doesn't waste his feed on scrub cows."

Carnation Heifer Breaks State Record

Avon Echo Daisy, a 4-year-old daughter of Avon Pontiac Echo owned by Carnation Milk Farms, Wisconsin, has completed a year record of 28,664.4 pounds of milk containing 899.9 lbs. butterfat. (1,124 pounds of butter), the largest milk record ever made by a 4-year-old in the state of Wisconsin. This is the fourth daughter of Avon Pontiac Echo under full age to produce over 1,100 pounds of butter in a year.

Experience With Rock Phosphate

(Continued faom page 178)

nd the deep blue green color of the nore robust plants.

Meanwhile I have made some trials vith heavier than one-ton applica-ions. Apparently it will pay to use t least a ton per acre, thus adding bout 260 pounds of the element hosphorus to the acre. This is as nuch as is removed by twenty big rops, but it should be remembered hat there are only 1,100 to 1,200 ounds of phosphorus in an acre of lowed soil and profitable crops can ot be grown without assistance if he natural supply falls below 1,000 ounds per acre of plowed soil. As n experiment to see if there are bad ffects from extra heavy applications, gave an alfalfa plant a dose equal o 500 tons per acre. After two ears the alfalfa plant has shown no njury and has survived almost com-lete destruction when the chickens te it leaf, stem, and crown.

Other plants have responded to ex-ra heavy applications; one rose, an Ophelia, last season gave us seven ozen cut flowers.

Bulb plants like tulips and gladi-li respond but they first store their lant food and the full benefits are ot apparent the first season. This is rue, also, with blackberries. Among ne vegetables, tomatoes have re-ponded noticeably in six weeks, so lso carrots, peas, and beans.

B. B. SIMMONS & SONS, PEWAUKEE, WIS.

With This End in View

— You Can't Resist the Ayrshire!

For the "business end" of the Ayrshire is a model of beauty and usefulness. — A long level rump, clean-cut thighs, sturdy feet and legs, and an udder with every ideal characteristic are constantly before those farmers fortunate enough to have this end in view.

These farmers have learned that Ayrshire udders are built to produce and wear for the life of the cow. With ample size, perfect shape aud strong attachments, Ayrshire udders also possess that mellow, elastic quality that means heavy production year after year.

With This End In View The Ayrshire Is The Most Profitable Cow.

Write for booklets or let us help you get a foundation.

AYRSHIRE BREEDERS' ASSOCIATION, 10 Center Street, BRANDON, VERMONT

Ayrshires

—are a plain business proposition. "Profit" is always the biggest possible return from the least possible outlay. That is "AYRSHIRES" in a nut shell.

Let us give you the official figures covering Pinehurst Farm Ayrshires. They are of value to every one who farms to make money. Address

PINEHURST FARMS, Mr. J. S. Dunlop, Pinehurst, N. C.
AYRSHIRE CATTLE AND BERKSHIRE HOG BREEDERS

Shoveling Snow With a Scythe —

There's a man in your neighborhood who is trying to make a few dollars by milking a few cows. Ordinarily, his intelligence is above the average, he is a hard worker, and he tries to be a good farmer, but—

He's just neglected to consider the business side of dairying. He still uses a scrub bull, and he doesn't keep record on his cows. He might just as well try to shovel snow with a scythe. We could tell him about some farmers who are making *real profits* from Guernseys. Tell him to write for

"THE STORY OF THE GUERNSEY"

THE AMERICAN GUERNSEY CATTLE CLUB

8 Grove St. — PETERBORO, N. H.

SPELLS

PERSISTENT PRODUCTION and REAL ANIMALS

Build up your herd by using a bull calf whose sire and dam come from *persistent* producers and real individuals. Our prices will interest you if you want a REAL sire.

D. G. TENNEY, 15 West Fourth St., NEW YORK CITY

MARSH FARM GUERNSEYS

Founded upon CHERUB blood, combining modern show type with production. At the last 13 National Dairy Expositions 46 out of 78 championships have been awarded to cattle from this farm. There are now in the herd 40 cows with yearly records of 500 pounds of fat in Class G. to 900 pounds of fat in Class A. In your efforts to improve the type of your cattle, the show ring records indicate Cherub blood as the really sure way. Let us advise you about your next sire.

MARSH FARM, WATERLOO, IOWA

BUY LADYSMITH CHERUB BLOOD

Shorewood Farm offers the bull, SHOREWOOD HERO, a double grandson of Ladysmith's Cherub whose 19 A. R. daughters average 600 lbs. fat. Dropped April, 1926, solid fawn, good individual. Sire—Cherub's Royal Leader of Shorewood (senior herd sire) whose dam, Pearl of Pomeroy, has 777 lbs. fat in AA., full sister to Pearl's Dot, 965 lbs. fat AA. Leader's first three daughters on test are doing exceptionally well. Dam—Cherub's Procris of Shorewood, undefeated 2-year-old and grand champion at 3 large shows, 1925. A. R. record 10,500 lbs. milk, 540 lbs. fat Class G. while on show circuit. Her dam, Ma Chere Procris, National grand champion 1921, A. R. record 17,900 lbs. milk, 831 lbs. fat, Class A. A wonderful combination of Ladysmith Cherub, May Rose and Jardinere Masher blood. Write for pedigree and price.

SHOREWOOD FARM, CRYSTAL BAY, MINNESOTA

Waukesha and Watertown

[200 PUREBRED HOLSTEINS]

Never Before Have 4 as Good Foundation Herds Been Sold in One Sale!

THE WALCOWIS HERD

Owned by Louise H. Dickinson, Lake Geneva, Wisconsin

65 REGISTERED HOLSTEINS

Including 12 mature daughters of Iowana Sir Ollie Grand Champion National Dairy Show 1919. They have records up to 900 lbs. butter in a year as 2 year olds. 50 granddaughters of Iowana Sir Ollie; among them: 10 daughters of Sir Ollie Mooie Watson, 36-lb.-son of Iowana Sir Ollie. 22 daughters of North Star Gift Champion, a Son of Johanna Bonheur Champion, from that former worlds record cow Little Gift of Spring Valley. North Star Gift Champion, the herd sire, and six other bulls from six months to a year old will be sold. You know the Herd. It has long been one of the best in the State.

J. W. HOWARD'S HERD

Genesee, Wis.—30 REGISTERED HOLSTEINS

Including—8 daughters of Pabst Champion Hartog, a 26-lb.-son of King Pontiac Champion. 4 granddaughters of Terracelawn Hengerveld Segis, whose daughters twice won the get of sire class at the National Dairy Show. 5 granddaughters of Woodcroft Perfection, the 40-lb. bull. This is a high class herd of producers, cattle that should interest those who want to add some of the profit making kind to their herds.

O'CONNOR BROS. HOLSTEINS

Watertown, Wis.—60 HEAD

40 purebred cows and heifers—3 milking age

This herd was built entirely on a Homestead foundation. It is one of the oldest and best herds in Dodge County. It includes:
26 daughters of Carnation Johanna Matador, a son of Matador Segis Walker. 20 daughters of Colantha Walker Segis, a son of Carnation Segis Prospect. One expects good cattle from such breeding and this is a herd of good ones.

THE LAURITZ LARSEN HERD

From Elroy, Wisconsin — 35 GOOD HOLSTEINS

A herd that includes: 15 good cows, 5 two-year-old heifers, 6 yearling heifers, 8 heifer calves.
These are practically all daughters and granddaughters of semi-official record cows and among them are 2 daughters of a 900-lb. cow. These are the kind of cattle every good dairyman likes to have. The entire herd is largely of Admiral Walker Prilly breeding.

AITKEN BROS.—Waukesha, Wis.

are consigning 15 head. 8 are daughters of King Bess Johanna Ormsby, whose dam is the only four times 40-lb. cow, also the only three times 1,000-lb. 305 day cow. Their dams are largely daughters of Terracelawn Hengerveld Segis and bred to Dodge County Homestead Boy, ages from 1 to 7 years.

All Herds Federal Accredited and sold on a 60-day retest.
For Further Information, write —

Waukesha Sale & Pedigree Co., Waukesha, Wis.

WALCOWIS and HOWARD HERDS At WAUKESHA, MARCH 1

O'CONNOR and LARSEN HERDS WATERTOWN, MARCH 2

R. E. HAEGER, J. E. MACK, Auctioneers

There Was Never Anything Like This Before

SIX 2-year-old heifers have completed year records at Carnation Farms recently. The average production of the six is 1061.82 pounds of butter from 24,451.3 pounds of milk.

The lowest producer of the six broke the world's record by producing 18,448.7 pounds of milk containing 900.27 pounds of butter on *3-time-a-day* milking as a 2-year-old.

One of these 2-year-olds produced 28,967 pounds of milk and 1177 pounds of butter in a year. No other 2-year-old of any breed ever did that.

Another produced 1220.26 pounds of butter and 25,000 pounds of milk as a junior 2-year-old. No other 2-year-old (junior or senior) of any breed ever did that.

Three of these heifers produced over 1166 pounds of butter in a year. In no other herd in the world are there three such 2-year-olds.

The first time it happened people said it was luck, but when it keeps happening right along on one farm — and when the first heifers that produce at such a rate represent a certain combination of breeding — any thinking man recognizes that an ideal combination of breeding has been discovered and this is the result of it.

"The Lazears" of Cheyenne, Wyoming, asked us to pick out the most reliable bull we could get for them. We selected a bull of this same combination of breeding. The first two daughters of that bull to complete year test average 22,093 pounds of milk and 934 pounds of butter as junior 2-year olds.

WHY GUESS WHEN YOU CAN KNOW?
LET US TELL YOU ABOUT IT!

HOLSTEINS

—Producers of Cash!

Holsteins stand supreme as butterfat producers. Holsteins in most instances are leaders in cow testing associations, both in individual and herd records. Under official test the important records for butterfat are all held by Holsteins. Their ability to produce butterfat, milk and calves economically, make them consistent producers of cash.

FEMCO FARMS, F. E. Murphy Co., BRECKENRIDGE, MINNESOTA

Why their alfalfa was killed last winter

Last year about 100 farmers of Buffalo County, Nebraska, set out to determine what killed their alfalfa during the winter. The conditions on a farm in Shelton are typical of what they found. This farm has two fields of alfalfa, side by side, which were sown with two different kinds of seed. One field showed a perfect stand while the other was badly thinned out. *The cause of the winter killing was directly traced to poor seed.*

Poor seed is like poor lubricating oil

Neither cheap seed nor low-priced lubricating oil is a profitable investment. Farmers who turn to Gargoyle Mobiloil are often astonished by the many ways in which Mobiloil returns its small extra price. Less time out for repairs. Fewer stops with a tractor because of overheating or thinned-out oil. Less carbon. Better compression and valve action. And Mobiloil frequently cuts oil consumption from 10% to 50% —saving more than its few cents extra cost per gallon right there.

Do you realize the importance of these facts?

Make this CHART *your guide*

THE correct grades of Gargoyle Mobiloil for engine lubrication of prominent passenger cars are specified below.

The grades of Gargoyle Mobiloil, indicated below, are Mobiloil "E," Mobiloil Arctic ("Arc"), Mobiloil "A," Mobiloil "BB," and Mobiloil "B."

Follow winter recommendations when temperatures from 32° F (freezing) to 0° F (zero) prevail. Below zero use Gargoyle Mobiloil Arctic (except Ford Cars, use Gargoyle Mobiloil "E").

If your car is not listed below see any Mobiloil dealer for the complete Chart. It recommends the correct grades for all cars, trucks and tractors.

GARGOYLE

Mobiloil

Make the chart your guide

(1) Mobiloil is the favorite oil with automotive engineers. (2) Mobiloil is asked for by 3 out of every 4 motorists who buy oil by name. (3) Mobiloil was used in such famous flights as the U. S. Army Round-the-World flight, Byrd's flight to the North Pole, and Lieut. Maughan's Dawn-to-Dusk flight across the United States. (4) The Mobiloil Chart has the approval of 609 automotive manufacturers.

The full economy of Mobiloil will be yours this year if you follow the recommendations in the Mobiloil Chart for your car, your truck, your tractor, your farm lighting engine and your stationary engines. 42 Mobiloil engineers made a careful study of all automotive engines before this Chart was made. Your engines were included.

The Chart is shown at the left in brief form. Your nearby Mobiloil dealer has the complete Chart. Ask him what grade of Gargoyle Mobiloil to use in each of your engines.

The Mobiloil dealer will supply you with the correct grades of Mobiloil—at a substantial saving if you buy in barrel or half-barrel lots. It will be a wise move to see him now about your season's requirements.

HOARD'S DAIRYMAN

A JOURNAL DEVOTED TO DAIRY FARMING

Volume 72, No. 5 Fort Atkinson, Wisconsin March 10, 1927

JOHN KOCH

Rawleigh Ideal Farms, Freeport, Ill.

EVERY RAISER of pure-blooded Poland China hogs has heard of Rawleigh Ideal Farms. Here is the home of Sun Ray No. A5, a boar that sired two two-ton litters. He is shown in the photograph, with Mr. Koch, the only man on the Rawleigh Farms who dares get into a pen with him without a hurdle. "Looking after 1000 head of pure-blood hogs," says Mr. Koch, "requires a lot of footwork in all kinds of weather and over all kinds of ground. I find the Ball-Band heavy dull sandal the most convenient overshoe for all-round farm wear. It is heavy enough for most wet weather outdoors and yet light enough for work in the hog house. It keeps my feet off the cold concrete floors, and yet keeps my shoes dry when I have to step in the mud or wet. I always ask for Ball-Band rubbers and look for the Red Ball trade mark because experience has taught me it pays to do so."

GEORGE H. PARKER

R. R. 9, Fort Wayne, Indiana

MR. PARKER says: "I have worn Ball-Band rubber footwear for twenty years, so when the Mishko Shoe came out I thought I would see if the Red Ball on work shoes meant as much as it does on rubbers. It does. I used to have to resole my shoes two or three times, at a cost of 50 to 60 cents each time if I put the soles on myself, or $1.00 or $1.25 if I had them resoled in town. I don't have to bother about resoling at all with the Mishko Shoes, because the Mishko sole lasts as long as the uppers and at the same time outlasts two or three ordinary soles. I pay a little more for the Mishko Shoes to begin with, but that isn't the way to figure it. Look what I save in resoling costs, not to mention the time lost in doing it and the discomfort of walking around on rough ground in soles getting thinner and thinner. No, sir, unless I see a Red Ball on the heel of a shoe, I don't buy it."

HENRY MARTIN

Clinton, Mass.

"I BOUGHT a pair of Ball-Band Moccasin Work Shoes about 18 months ago, and the original soles have not yet worn out.

"I am a line inspector employed by the New England Power Co. and my work takes me through the hardest of walking through swamps, woods and all kinds of hard, rough going.

"They are the best wearing shoes I have ever had, and will continue to wear them and tell my friends about them."

They have solved the work shoe problem

These men, whether working around the house, in the barn or on the job, say that the Mishko Shoe gives them more comfort and longer wear than any other shoe they've ever worn.

TENDING market, raising hogs, or stringing telephone wires is work that puts footwear to severe tests. Millions of outdoor workers all over the United States, like those quoted here, have found from years of experience that the one sure way to get not only foot comfort but also *more days wear* in rubber and woolen footwear is to ask for Ball-Band and look for the Red Ball Trade Mark. They also get the same long service out of work shoes that are now a part of the Ball-Band line. These are known as Mishko Shoes. The soles are a special Ball-Band product and outwear two or three ordinary soles. You can have them either nailed or sewed on. Mishko Shoes are also made with high lace tops.

TRADE MARK

They are sold by most Ball-Band dealers, and there are Ball-Band dealers everywhere. If you have any difficulty getting what you want, write us for the name of a nearby dealer who can fit you. Mishawaka Rubber & Woolen Mfg. Co., 313 Water St., Mishawaka, Ind.

After Two Thousand Years

CALUMELLA, writing in the first century A. D. concerning ways and means of maintaining the productiveness of land and of feeding live stock, recorded some things that bear repetition even after nearly two thousand years of seed time and harvest.

He wrote: "Some of the leguminous plants manure the soil and make it fruitful, whilst other crops exhaust it, and make it barren. Lupines, beans, peas, lentils, and vetches are reported to manure the land.

"The best forage plants are alfalfa, fenugreek, and vetches. Alfalfa may be placed in the foremost rank of such plants; for when once sown it lasts ten years, fattens lean cattle, and has a salutary action on sick cattle."

It is interesting to note this Roman agricultural writer recording his observations of soil and of cattle feeding problems 2,000 years ago.

His observations were correct. He, perhaps, understood little of why legumes enriched soil with nitrogen and why alfalfa was a better forage than any others grown at that time.

After 2,000 years, legumes continue to play an important part in soil productivity and alfalfa is queen of the legume forage crops. This is true for the farmers who practice what Calumella knew 2,000 years ago. Unfortunately, however, there are altogether too many farmers whose methods preclude the application of this fundamental agricultural knowledge.

If Calumella could make some observations today in many sections of this country, noting the thousands of acres of land hungry for legumes and the hundreds of thousands of dairy cattle fed non-legume hays, he would probably record his observations something as follows, addressing his remarks to the Congress of the United States:

"I have been about some in these states which the members of Congress represent, observing the practices of many of the constituents of the senators and representatives particularly concerning soil improvement and cattle feeding. I find altogether too many of these men growing either no legumes at all or very small acreages with the result that their soil is impoverished and their cattle poorly nourished.

"I observe also that some farmers are much more prosperous than others and on inquiry of these men I find that they attribute part of this prosperity to their practice of growing and feeding legumes, particularly alfalfa. What these men are doing for themselves other men might well consider.

"By inquiry and by reading I find that the Congress is urged to pass legislation in the interests of farmers largely on the basis that agriculture is discriminated against by reason of certain legislation heretofore granted to labor, capital, and industries.

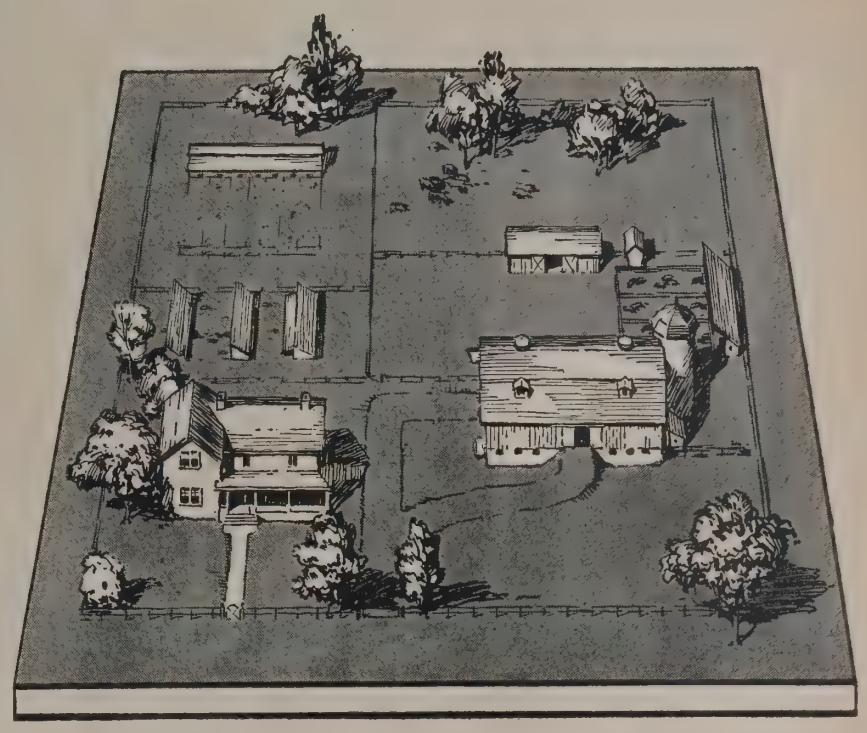
"My sympathies are aroused for the men who produce the vital essentials for the people of the states represented by this Congress. Whatever it may be that is unjustly preventing the fair and full exercise of the efforts of farmers to make agriculture stand successfully on its own foundation, it ought to be removed.

"I observe also that there is much difference of opinion among farmers as to what is best for the Congress to do; and there is a like difference among the members of this body both as to how far the government should go in assuming the burdens of agriculture and as to a method of giving aid.

"It may be that out of the unlimited controversy over ways and means of giving agriculture a square deal, the Congress may be able to place the government in such a position that its services will enable farmers to gain for themselves a position in which there is no unjust discrimination as to opportunity as compared to labor, capital, and the industries.

"In the meantime, while farm leadership is becoming better acquainted with what the government can and cannot do for agriculture, while the senators and representatives are learning some of the same and also jockeying for political preferment, might it not be a good thing to encourage farmers to help themselves in a number of ways over which there can be little difference of opinion?

"To my own personal knowledge it has been known for 2,000 years that legumes were good for the soil and that they made the best hays. On inquiry from the Department of Agriculture, I find that everything possible is being done through the Extension Service of the various states to increase the acreage and use of legumes and that there is a very good response among farmers, particularly during the past five years.



"I hear some farmers say that this increase in acreage and use of legumes will increase production and thereby cause a surplus of products. In dairying, the remedy for this is to eliminate the poor producing cows thereby removing the unprofitable surplus.

"It is not sound business to subsidize a scrub cow or a poor acre of land; to do so offers false hope to the owner thereof. Let him eliminate the poor cow and improve the ration of the good cow by growing and feeding legumes of which alfalfa is the best. This will improve the land. It is a practice—a remedy—about which neither statesman nor farmer can have but little difference of opinion."

USING THE BUCK RAKE IN STACKING ALFALFA HAY IN NEBRASKA

LOW-COST Protection *for* Home and Stock

Protection from fire—from winter's wind and cold and damp—from summer's heat—from destructive vermin:

All these you get at low cost when you make the walls and ceilings of your farm home, barns and other buildings out of Sheetrock.

FIREPROOF . . INSULATING . . VERMINPROOF . . NON-WARPING . . TIME-TESTED . . TAKING ANY DECORATION . . EASY TO PUT UP AND PUT UP TO STAY

Sheetrock is made from pure, unadulterated gypsum, 3/8-inch thick and specially surfaced for strength.

With the USG reinforced joint system all joints are sealed and concealed, and the smooth, flat surface of Sheetrock takes any decoration, wallpaper, paint, or *Textone*, the plastic paint that combines both tone and texture in beautiful results.

You can always tell Sheetrock by the USG Sheetrock brand on every sheet, with the Underwriters' stamp of approval. Made only by the United States Gypsum Company. Your local dealer has it in stock or can get it for you promptly from our nearest mill.

Sheetrock is inspected and approved as an effective barrier to fire by the Underwriters' Laboratories, Inc.

Name .....

R. F. D. ..... *Town* .....

State .....

The Chevy Chase Dairy employs signs like this one to tell the people of Washington that their milk is "Safe for Babies."

As stated on the sign, this milk is produced for them by Dr. J. Thomas Kelly, on whose Pleasant Hills Farm at Germantown, Md., the De Laval Milker is considered a tremendous aid in the production of clean milk.

75 Per Cent of Washington's Grade A Milk is Produced with De Laval Milkers

DE LAVAL Milkers produce approximately 75 per cent of the Grade A, Certified and Special Nursery Milk consumed in Washington, D. C., at the present time. In the Washington milk shed, as in other sections, dairymen have found the De Laval Milker a material aid in making clean milk of low bacteria count.

However, the sanitary feature of the De Laval Milker is only one of the many advantages that combine to make the De Laval Milker a necessity to every milk producer. The fact that the oldest users of the De Laval Milker are its strongest boosters is perhaps its finest recommendation. At the right are nine facts based on a report on the De Laval Milker made by 1844 users in the United States and Canada. Read them.

Facts About the DE LAVAL MILKER

1. 650,000 cows now milked the De Laval Way.
2. De Laval Milkers now in their eleventh year of use.
3. 83.27% of the users report average saving of 2 1-5 hours* per day—saves half the time in milking.
4. 97.13% of the users say it agrees with their cows.*
5. 99% of the users say they get as much or more milk with the De Laval as they did by hand milking.*
6. 9.49% average increase in production per cow is reported by those who claim the De Laval Milker increases production.*
7. 94.80% of De Laval users say their milker is easy to keep in a clean and sanitary condition.*
8. Average bacteria count of all reporting, 14,542—62% report counts of 10,000 and less.* 28% report counts of 5,000 and less.
9. 96.45% of De Laval users say their milker is "the best," "one of the best," or a "good" investment as compared with other farm equipment they own.

DAIRYING IN THE DESERT

GUY A. PETERSON, WISCONSIN

HAT a difference a little water can make was strikingly impressed upon us last sumhen we crossed the Utah desert way to Salt Lake City. Just we reached the border line of id lands at Mack, Colorado, we driving through an irrigated where alfalfa stacks dotted ndscape with their air of pros. Beautiful dairy cows grazed tedly in the rich green pastures prang up on the fertile, windsoil that had lain unused for ies until a few years ago when nd of man built ditches to supwith moisture. As we stood on ge of the water line and looked ve could see a valley filled with rous looking farms, well bred cattle, and comfortable homes. West lay a boundless expanse ing land almost devoid of vegt. Even the sage brush was d, shrivelled, and weather-

A TYPICAL ALFALFA HAY STACKER IN THE IRRIGATED SECTIONS OF THE INTER-MOUNTAIN STATES

This was one of the stackers we saw before we went into the desert at Mack, Colorado.

Storm Clouds Appear

n we stopped to fill our water reparatory to taking the windad that led into the barren an old, wrinkled, and grayd man told us that we would o hurry if we expected to Cisco, the next town forty miles before the storm hit us. He e road would probably be imle inside of four hours as the would be filled with muddy, en water, but he thought we be able to get ahead of the del we were traveling Southwest he clouds were coming due He advised us never to stop in m bed because water somecomes down so quickly and unedly that cars have been away by the wall of water. here are no trees and little vegof any kind in a stream's ge shed there is nothing to re- flow of the water, so the gulat carry raging torrents one ay be bone dry before the day found many of the bridges had washed out by a freshet some before so we often had to drive down the streams for some distance in order to cross them. The road bed washes so easily and the gullies fill so quickly that the problem of straight road building and maintaining bridges is a great one in this country.

Cisco Has One Cow

The possibility of getting drowned in a desert had never occurred to us before so it was a novel experience to be racing with a storm. In spite of our hurry, however, we always took the precaution to take the dips across the gullies in low gear. Our ride was full of thrills, but we pulled into Cisco just before dusk. The air was filled with dust, the wind was blowing a gale, and some rain was falling.

HOMER AND JOHN THAYN STANDING BESIDE AN ALFALFA STACK

Their farm is bordered by scrubby sagebrush on two sides, but thanks to the application of irrigation water the land is beginning to "blossom as a rose."

After we had decided to stop in the postmaster's log cabin over night, we were agreeably surprised to find that Henry Hansen, the custodian of the mails for the village, had come there from Waupaca, Wisconsin, sixteen years ago. For years he had owned the sole dairy cow in the village of fifty inhabitants but this honor is now held by the storekeeper, as Mr. Hansen sold his cow and is now having his milk brought in on the train. We went out to see this lone cow and found her tied in a log barn eating alfalfa hay that had been shipped in from Grand Junction, Colorado. We were not so fortunate as to drink any of her milk, however, as her entire production was used by the storekeeper and his family. The cow wasn't much to look at but she was gentle, and since Mr. Hansen told us that she was the only milch cow in forty miles, we led her out and took her picture just the same. We were surprised to find that her stall was lighted with electricity, but upon investigation we found that the residents can have this convenience even though they do live in a desert, because a stationary lighting plant has been installed by the innkeeper.

Why Not Irrigate

In the course of the evening's conversation we asked Mr. Hansen why the surplus water that comes rushing down those gullies could not be impounded and used for irrigation purposes. He told us that it had often been tried but the water is so full of silt that the storage reservoirs fill up in a short time, so he does not believe that the desert around Cisco will ever be conquered for intensive agricultural purposes, although the tufts of bunch and sand grass that make a sparse growth in the moisture-lacking silt do make fair winter sheep feed, so thousands of sheep are wintered there and are either loaded on trains or driven back to mountain pastures in the spring.

We got an early start next morning because the storm cloud had proved to be only a windy one so nothing serious had happened to the roadbed ahead of us. We could not help but think that it would be profitable for at least one man to develop a dairy herd because hay and grain can be reasonably purchased at Grand Junction, Colorado, a distance of less than a hundred miles away; water for cooling purposes can be pumped from the wells that were sunk in the hope of finding oil; and it would seem that a good market could be developed because thousands of tourists pass through the village every year, as it is located on the PPOO highway.

Our ride that morning was uneventful. For mile after mile we traveled through a land which, save for an occasional oasis, was uninhabited by man. In spite of the barrenness, however, the scenes were not oppressive because there were a few tumble down homesteader shacks to show where families have tried or were still trying to make farms on land that never had and never will have enough water to make them profitable for general farming. Farther east, in the sections where nature fashioned the land for range grazing purposes, we came upon many and many an example of unsuccessful attempts to make a living on 160 acres of semi-arid land that had no access to irrigation water. There are thousands of iron stoves rusting away on the western plains. Often they are the only things that remain to show that a family once lived on these spots, because the little shacks have burned to the

What I Am Trying To Do On My Farm

By Taking The Gamble Out Of Farming

W. J. DOUGAN, WISCONSIN

THE farmer is a notorious gambler. He takes desperate chances on the weather. He puts his all into planting and tilling the crop. It is thrown out to the mercy of the weather. With favorable weather, the farmer wins. A drought or flood, a storm or frost can turn his wheel of fortune to partial or total loss. The farmer guesses on crops. He may guess this crop or that will be the best pay this year, and then throw all his energy into getting the crop. If his guess were lucky, he wins; if unlucky, he losses.

The farmer gambles on prices; and with the speculation in farm produce and our present marketing system, he is, too frequently, trying to win on the other fellow's game.

We hold in contempt the gambler who pawns his wife's jewels and clothing to get money for the game. The farmer does worse than this. He puts up as stakes the very life of his wife, the education and future of his children, and his own strength to the limit. His all goes into the pool. If he loses, he loses opportunity for life for himself and his whole family; but if he wins, he wins but a pittance, —a mere existence for himself and family. The odds are always against him when he gambles in the farming game.

I am taking the gamble out of farming first by diversified farming. I raise clover, alfalfa, corn, small grains, potatoes, vegetables, and fruits. A season may be good for clover and poor for alfalfa, or vice versa. It was a surprise to me when I discovered this fact.

A few years ago we had a heavy April freeze. It more than halved the clover yield but had no serious effect upon the alfalfa. By using both crops I lessen my chances of being left without a hay crop. Corn is a sure feed crop with me. I have silage room to store a frosted crop, and by rotating crops keep my soil so it can force growth and maturity of the corn. In both of the recent off-corn years, 1924 and 1926, I had better than a 100% of normal crop. By rotation and diverse crops I can count on an 80% or 90% crop almost any year.

I diversify in live stock. My place carries eighty head of cattle, nearly one-half of which is growing stock; one hundred hogs, seven horses, besides poultry for family use. I will not let my place become merely a milk cow farm, even with milk at 20c per quart. Thus, by diversifying in crops, in stock, and in operations, I am lessening chances of loss—taking the gamble out of production.

I am taking the gamble out of farming by controlling my income and expenditures. The year 1911 was for me a low year. Professor Otis, then of the University of Wisconsin Department of Farm Management, told me I must cut down expenses or cut up income. I cut up both, and have since that year shown a good net profit. I control my income, first, by having a say in the price of my milk; second, by controlling the volume of product; and third, by controlling the cost of production.

I control my expenditures by the budget system. I plan my year ahead. If heavy expenditures are necessary in one department, such as new machinery, I cut down on expenditures in building, repairs, or expansion in some other line. I know I will have so much to expend, and I divide it so as to keep the whole work progressing. This is only possible where one keeps comprehensive accounts.

The farmer can no more do successful business without a complete and comprehensive accounting system, than can any manufacturer or business man.

Are these ideas of soil improvement, marketing, and handling of labor, which I have been emphasizing in this series of articles, practical? The practical, open-minded farmer insists on putting the question, "Will it pay?"

I must again refer to my own experiences to justify my ideals. The year 1924 was normal on my farm in most respects, and a fair example of the working of these ideals.

For several years the interest on the investment has ranged around 8%. While this is not high, when we consider that the farm has given a good living to a large force of workers; a nominal cash salary to the ator and a considerable indir towards his living; and kept u pairs and improvements, I feel satisfactory.

The detailed financial stateme as follows:

Total net investment, Jan. 1, 1924		$
INCOME		
Crops	$	381
Live stock		
Cattle		1,422
Hogs		1,544
Dairy products retailed		25,435
Rents (tenant houses)		467
Increase inventory		312
Total income		$
EXPENDITURES		
Permanent improvements	$	733
Live stock purchased		1,075
Labor expense		7,439
Repairs		906
Machinery		536
Feed		2,254
Supplies		3,445
Taxes and office expense		1,066
Milk purchased for separating		4,632
Miscellaneous		209
Total		$
Net farm income without deducting interest		$
Operator's cash salary, besides supplies furnished him from farm		
Total interest on investment		$

$5,466 is 8¾% interest on $62,418.

MR. DOUGAN'S TON LITTER OF 1924
Diversified live stock takes the gamble out of farming.

TAKING THE GAMBLE OUT OF FARMING BY DIVERSIFIED CROPS

Joe Guesser Is Converted—A Dairy Play

R. E. HARMAN, NEW JERSEY

Cast: Joe Guesser, a sort of a dairy farmer.

Katrinka Guesser, Joe's wife.

Boaz Guesser, Joe's son, classmate of Jack.

Jack Bookkeeper, son of Bill, classmate of Boaz.

Bill Bookkeeper, an up-to-date dairy farmer.

Isabel Bookkeeper, Bill's wife and Jack's mother.

Paraphernalia: Bill Bookkeeper, prosperous looking in dress, cane, shine, press, etc.

Jack Bookkeeper, golf suit and well mannered.

Boaz Guesser, old clothes as worn working about the cows and barn.

Joe Guesser, clothes somewhat dirty and torn, overalls, etc.

Katrinka Guesser, very old clothes, torn apron, etc., (loud talker and excitable.)

Scene I

Katrinka starting the wash in the Guesser kitchen, the man and son finishing breakfast; milk buckets, cans, bottles, overshoes, and other things found in the dairy farm kitchen to make it untidy. Table unkempt, paper tablecloth, etc. Washtub on box entirely too low; washboard.

Katrinka: "This living on the farm is getting on my nerves. All I do day in and day out is work, work, work. (Shoves milking utensils out of the way.) Joe Guesser, if you don't get a bustle on you and get a milk house built, I'll go crazy! You don't see Isabel having a part of the barn in her kitchen. These pesky milking utensils are aging me fast. I only hope not many farm wives have to nigger and slave as I have to!"

Joe: "I told you we don't have money to build no milk house. You can't build milk houses with feed the way it is and milk 7c a quart!"

Katrinka: "Well, I know we have no money or I wouldn't be bending over no washtub rubbing all these tarnal clothes out by hand. I start washing Mondays at six o'clock and finish some time in the afternoon. Isabel starts at 9 o'clock and with her electric washer she is finished and gets a rest before she gets lunch for Bill. Seems funny we can't even have electric lights when the line goes right past the house. No wonder young people want to leave the farm."

Boaz: "Mr. Bookkeeper even milks and clips his cows by electricity. The milk tester persuaded him to put water into his barn so the cows could get more to drink. He says milk is made up largely of water."

Joe: "Boaz, you're too young a fellow to be telling your old Dad what to do. Better get out and start cleaning the stables. Monday, you know, is the day we clean out. Last week we didn't get it done till Wednesday."

Katrinka: "Boaz, don't step in that water and track it all over the house. You'll soon be as bad as your father." (Boaz goes out.)

Joe: "If this boy doesn't stay home from those blamed club meetings he'll drive me mad. He even brought home a book to mark down the weight of each cow's milk. That would have meant a pair of scales. Our cows don't give so much milk that I don't know how much they give."

Katrinka: "Joe, why don't you go to one of those meetings and see what goes on. Mr. Bookkeeper never misses one. Jack even bought a pure-bred heifer and joined the club. Jack used to keep a milk and feed record of their cows. Now I hear they are so high toned they hire a man to come around and do it for them. He's a cow tester, I think."

Joe: "I'd like to know where Bill and Sallie get their money. I don't know of any relatives what died. I know about all the crops he raises are stuffed into his cows and Lord knows there's no money in producing milk nowadays."

Katrinka, as Joe starts for the barn: "Now, mind you, we've got to dig up some mone groceries pretty soon. Th time the grocer came he we'd not get another worth until we paid some on our bill. We owe him over already."

Katrinka to self: "Seems th some farmers' wives are for wash, sweep, cook, and wash, s cook. No money for clothes a time for nothing. I have a that it would do Joe and me g visit some of our neighboring men who are making money a how they do it. That record Boaz brought home looks good but Joe only laughs at it."

Scene II (In the Barn)

Boaz to Joe: "Dad, I wis wouldn't have destroyed that book and barn sheets which th agent gave me. What will I te happened to them?"

Joe: "Tell him the truth young fellow is coming aroun farm persuading my boy how this business. There were dai before we had any county age this county."

Boaz: "Mr. Bookkeeper sold cows soon after Jack star weigh their milk. Now he has a cow testing association an tester figures out both the mi feed for each cow. They onl the calves from the best cows."

Corn Borer Threatens The Dairy Industry

O. A. HANKE, ILLINOIS

WITH the discovery of the corn borer in Illinois and its positive identification early in anuary, comes an increased interest n th spread of this seemingly uncon-rollble insect, which is now half ay across the corn belt despite the igi quarantine which has existed nd been vigorously enforced in the fe ed area.

T o years ago, in travelling rough Indiana and Ohio, I first be-m acquainted with the quarantine

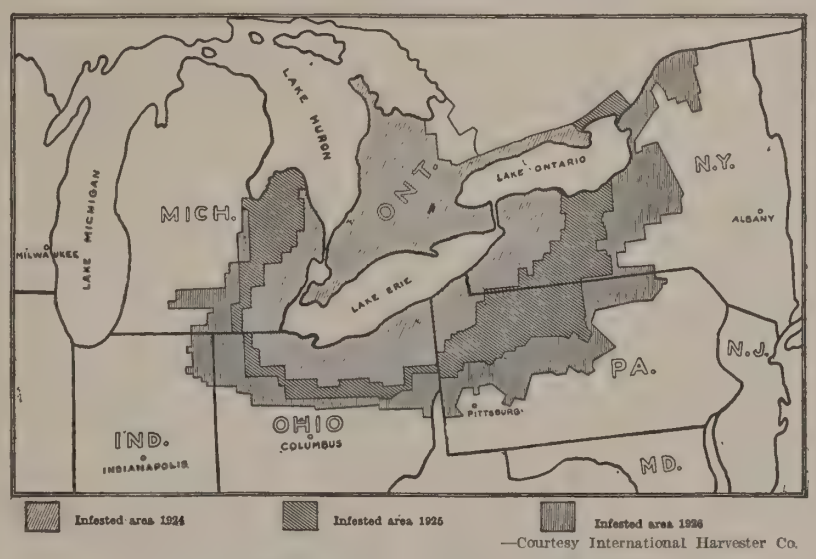
FEMALE MOTH BORERS (about natural size) MALE MOTH

To Control Corn Borer

1. Do not buy seed corn on cob.
2. Use latest machinery to cut corn low.
3. Put as much corn as possible in silo.
4. Shred the remainder.
5. Plow all stubble and stalks under before May 15.
6. Before May 15 shell all corn remaining in cribs.
7. Burn all fence rows and refuse before May 15.
8. Keep cornstalks out of manure which will not be plowed under by May 15.
9. Educate your neighbor.



fested area in America is in Sussex and Kent Counties, Ontario, about forty miles east of Detroit.

According to the report made by Lawson Caesar after a trip made through this region in 1925, "most of the fields there have an average of over 20 borers to the plant. In these fields practically every tassel has been broken off; every leaf has been killed and either fallen or hangs close to the stalk; the ears have broken down, about one-third of them have rotted, the remainder are stunted and most of them riddled by the borers; the stalks are punctured by borer holes, having numerous castings on the outside and are tunnelled on the inside in all directions. The result is that almost every plant dies long before it is mature and many of them break over, forming a tangly, filthy mass almost worthless as feed for cattle, and fit only for hogs to run in and feed upon whatever ears have escaped destruction."

Such a description of the existing condition in the infested area does not lend a very cheerful aspect to future conditions in the corn growing sections.

The infestation, which is spread through the corn belt, is a result of the Canadian condition. The corn borer was introduced simultaneously at three different locations, Boston, Massachusetts; Schenectady, New York; and St. Thomas, Ontario.

The Boston infestation has spread until it now covers quite a portion of New England. The Schenectady area has increased but slightly. The insects implanted in the Ontario region seem to have been most virulent and they have spread east into western New York, while the moths have blown across Lake Erie and infested many counties in Northwestern Pennsylvania, about one-third of Northern Ohio, the eastern part of Michigan, and the eastern portion of Indiana.

—Courtesy International Harvester Co.

THE ADVANCE OF THE EUROPEAN CORN BORER

The fast spread of this new infestation is particularly alarming. In addition to the territory shown above there is considerable infestation in Connecticut, Massachusetts, New Hampshire, and Maine. The most recent infestations have been found in Kankakee County, Illinois, and Berrien County, Michigan, both located near the southern end of Lake Michigan.

The present Illinois infestation is a jump of more than 100 miles.

Insect Baffles Scientists

Perhaps before we discuss the proposed control measures of the government, it is well to take up the life history of the insect and to note how control measures need to be adapted to its living habits.

The European corn borer is a larvae or worm which bores in the stalks, ears, and tassels of corn. Beginning with the adult moth, which starts its egg laying activities early in June, the insect has a complete life cycle. The adult, a yellowish brown moth with an irregular dark line running across the wings, begins its activities early in June. This moth can

Holstein-Friesian Cattle in the United States

THE cattle from which our present Holstein - Friesian breed has descended were developed in Northern Holland, especially in the Province of Friesland, and in the neighboring provinces of Northern Germany. The time of their origin as a recognized distinct breed is unknown, but it is probable that they have been selected for their dairy qualities for about 2,000 years.

Before 1885 there were two associations furthering the interest of this breed in the United States. One maintained a Holstein herd book, and the other a Dutch-Friesian herd book. In 1885 the two associations were combined into the Holstein-Friesian Association of America. While the official name of the breed is Holstein-Friesian, the single word Holstein is more common in ordinary use.

SIR INKA PRILLY SEGIS, LEADING HOLSTEIN SIRE OF YEAR-RECORD DAUGHTERS, 74 DAUGHTERS HAVING COMPLETED SEMI-OFFICIAL YEARLY RECORDS

Importations and Distribution

Cattle from the Netherlands were first imported into the United States by the Dutch settlers in what is now New York between 1621 and 1664 and at irregular intervals after the Revolutionary War.

The first permanent introduction of this breed was made by W. W. Chenery of Massachusetts, just before the Civil War. Since then, these cattle have been imported in larger numbers with the heaviest importations between 1879 and 1887. Thereafter a few were imported up to 1905 and since then, because of the prevalence of the foot and mouth disease, none have been brought to this country.

Well over a million and a half Holsteins have been registered in the American herd book and the 1920 government census showed 528,621 head in addition to 10,500,000 grades of the same breed on the farms of this country. Holstein cattle are found throughout all the 48 states, though by far the largest number are in New York, Wisconsin, Pennsylvania, Ohio, Michigan, and Illinois. These six states contain more than 60 per cent of all the pure-bred Holsteins in the country.

General Characteristics

The Holsteins are the largest of the dairy breeds. They have large frames but are not ordinarily very heavily fleshed. Calves weigh from 70 to 105 lbs. at birth. Mature bulls should weigh not less than 2,000 lbs. and a weight of 2,200 to 2,400 lbs. in good breeding form is desirable. Mature cows will weigh from 1,100 to 1,750 lbs. with a desirable average of from 1,200 to 1,350 lbs.

The color is black and white with the colors sharply defined rather than blended. They may be nearly all white or quite dark, but no solid color animal can be registered.

Production

Holsteins produce a larger quantity of milk with a somewhat lower butterfat content than any other dairy breed.

According to Advanced Registry records complete to April 1, 1926, 25,431 Holstein cows of all ages have finished long time tests with an average production for the entire number of 15,720.4 lbs. milk, 532.75 lbs. butterfat and an average test of 3.39 per cent. Two-thirds of these were heifers and since these records include both 365-day and 305-day test periods, the average length of test is 331 days. One hundred nine Holstein cows have produced over 1,000 pounds of butterfat each in a year's time and no less than 74 have year records above 30,000 lbs. of milk.

TRAILING HOLSTEINS TO SOUTH AMERICA

The Log of Their Keeper

JAMES G. BEATTIE, WISCONSIN

JANUARY 12. Ah! at 4 P. M. the strike of the Peruvian stevedores at Callao is settled. But the day is irretrievable. We have locomotives on the foredeck which are too big for our booms to lift, so we are ordered to the dock and the shore crane. We had to pass through two bottlenecks, one within the other; the Humming Bird being 400 feet in length scarcely scraped through. We moved perhaps 1,000 feet to get there, and it took the whole afternoon.

CUTTING GREEN CORN FOR THE COWS AT CAPURRO DAIRY

January 13. My milk stool was stolen last night. "Fawncy that!" said Percy, a sailor, who sleeps in the forepeak along with Tony. Now I suppose some dark-eyed senora has a new appointment in her boudoir. It is really too much to be a novice on a tramp ship and have to contend with these organized bands; but the bananas are ripe so I sat down beneath the stalk tonight and ate and high-hatted my troubles.

Some cargo was discharged this morning; then, when we began to unload the locomotives, the crane broke. So that makes it bad. The strike broke, the crane broke; what could be more demoralizing! The port captain chased us out in the bay, or until the crane is repaired. There is a bad swell in this harbor and large ships are hard on the docks when anchored to them. The Humming Bird broke four lines last night, the 6" in diameter kind, which is not good, not good for the fellow who has to buy them anyway.

January 15. The Humming Bird is asleep in her berth on the bay. We are always waiting for the dock. Visited the dairy of Senor Risso, near Lima, and was surprised at the excellent methods with which it is operated. Grade A milk, unpasteurized, brings about 20 cents per quart. He has an extensive hacienda, and with irrigation raises fine crops of corn, cotton, grains, alfalfa, etc. Help is cheap and they have no winters, so conditions are very favorable for dairying. Risso has 250 cattle in his herd, milking 100 at present. He has Holsteins from Wisconsin, Fribourgs from Europe, besides many native cows.

Land, irrigated and near Lima, is expensive; $150 per acre and up. But over the mountains homesteads, good land, can be had together with other inducements to settlers. A colony of 80 Scotch homesteaded here recently and are getting along fine. Peru is wealthy in natural resources, every phase of agriculture offering good opportunities.

January 16. The Humming Bird is still in berth 6, Callao, so I visited another hacienda—Camacho Limited. It is similar to Risso's, being a little larger if anything. Here were many fine Holsteins, Fribourgs, and Simmenthals. The latter are red and white; otherwise they resemble Holsteins, some being very good milkers. Camacho Limited retails its milk in Lima at a high price, has an excellent herd, and maintained under good management.

January 17. A heavy swell kept us away from the dock today. Last night Tony tried to absorb too much Italian cognac and the result was a night in the Callao hoosegow. If he had only remained with the sour wine, he would have escaped difficulties. But Tony had too much Peruvian money on his hands, too many big sols; and then he tried to convince four policemen all at one time, and four really are too many for one. An agent of the constabulary brought him aboard before noon and asked for a five dollar fine.

A PERUVIAN DAIRY BARN

This dairy is owned by Senor Capurro near Lima, Peru, where he maintains some 250 cows. One of the most unusual sights is to see the irrigation water running through the stone gutters at the rear of the cows. No litter carriers or manure spreaders; water does the work of both and leaves the stable always clean and sanitary.

Then there was more debauching last night; there seems to have been an epidemic of it. Wing and Wong, until now regular in habit and duty, stepped out. In some mysterious manner they found out that another ship, the Ben Hur, had arrived. They get no mail, these fellows; they could not see the Ben Hur from the decks of the Humming Bird because there were too many berths in between and each was occupied, yet they knew. How? Nobody knows.

On the Ben Hur were many Wings and Wongs, all shrewd fantan players, and so it came about, in the evening, after the dishes were washed and the bread set, that my pals of the davit hired a boaty man to row them to the Ben Hur. In their pockets were rolls that a size 14 collar wouldn't reach around (the ox, choked so many times, is dead now). They paid the boaty two prices to return for them at 5 A. M., but Mr. Boaty did not come, neither was he seen again. Wing and Wong got back eventually but their late arrival made the breakfast late and incidentally started gossip on its rounds regarding the Chinamen. Wong came back with marvelous profits for his night's effort and smiling plenty; while Wing got "cleaned" and smiled also. There's no figuring a Chinaman.

THREE "LICE" EATERS IN CALLAO HARBOR, WING, WONG, AND THE AUTHOR

Wong lost all his money at fantan when he visited fellow countrymen on another vessel, and he does not smile as does Wing.

January 19. We got the other engine off this A. M. The skipper went to the consul and cleared the ship and, tonight, we are on our way to Arica, the place where Pershing is scratching his head, trying to settle a little argument regarding Tacna and Arica.

January 20. The boat deck on the Humming Bird needs caulking. The sailors washed it down this A. M. and water leaking through soaked my bunk. We have steamed all day at 9.1 miles per hour. One sees many sharks in these waters, their sinister dorsal fins cutting through the water and rising above it as they cruise along by our side.

January 22. We arrived at Arica before noon, seeing it hours in advance of our arrival. Arica has no bay, it is more or less a bight, just an easy indentation in the Andes coastal range where the sea follows in a little way a giant coulee which forms an opening in the mountains for a railroad to come down to the ocean from the interior. The road runs back to Tacna and Bolivia.

The Denver and the Cleveland, escorts of Pershing, lie at anchor under a wilting sun, their decks sheltered with white awning. We had only 5 tons of cargo for Arica so, at 5 p. m., we are departing, dipping our flag to these Men-of-War as we go, and they dipping theirs in return. Nobody envies the boys their sojourn in Arica.

We have a big tramp cat on the Humming Bird whom, I believe, has not been mentioned before. He tramps it all over the world, members of this crew having seen him on many ships and in many ports. He goes ashore when he feels like it and comes back under the same conditions. And if he misses this ship, he waits his chance and catches another. He responds to the name of Lindy. He has a great knack of keeping his fur spick and span, is stylish, and permits no man to touch him. He is a prince of rat killers, but seldom eats them. He hopped up on the bulwarks and took one glimpse of Arica and then hopped down again. Evidently things didn't look good to him.

January 23. One sees not a sign of life or vegetation, as we steam down the Chilean coast. I used to think a whale, because of his size, was immune from all danger; but after seeing a thrasher shark kill one, perhaps 1,000 yards to starboard, I

(Continued on page 280)

THE PRESIDENT OF PERU AND SENOR CAPURRO

THE HELP ON A PERUVIAN DAIRY FARM

SWEET CLOVER TELLS ITS OWN STORY

Dairymen in Manitowoc County, Wisconsin, Have Seeded 10,000 Acres to Sweet Clover for Cow Pasture. This Story Tells What They Think of It and How They Do It

SIX years ago when R. R. Smith moved his family from Minnesota to Manitowoc County, Wisconsin, he took with him a well founded faith in sweet clover as pasture for dairy cows. Up to that time, Manitowoc County dairymen, and that means nearly every farmer in the county, had not learned much about this crop nor had many ever given it a trial.

Smith, anxious to demonstrate that a county agricultural agent could earn more for a county than was being paid him, started to preach sweet clover for cow pasture. He believed in it so much that he preached it at every opportunity—yes, he even created opportunity; he preached it fearlessly and with a zeal that bespoke his confidence in it. He told us about the first meeting of farmers at which he fared forth on his conquest for better pastures. It was at a winter institute. No one had ever talked sweet clover in that community before.

"After I get through," said Smith, "and the crowd had broken up a little, a big farmer walked down in front where I was and in a voice that left no uncertainty about the temper of the speaker, said, 'Young man, we don't want you to come around here wasting your time and ours talking about sweet clover. What we farmers want is something practical, something that will help us make some money.'"

The going was pretty tough for a year or two until Smith could get some evidence produced in the county. He found out that persuading a farmer to do a thing on faith is not as easy as getting him to do it after he has seen with his own eyes what it will do and heard a few of his neighbors give testimony of their experiences.

Smith kept pounding away and after awhile sweet clover began to tell its own story in a language that everyone could understand.

Today Manitowoc County dairymen are growing 10,000 acres of sweet clover for cow pasture and the end is not yet. More is grown there for this purpose than in any other county in Wisconsin and more for this purpose perhaps than in any similar sized area in the United States. Because of this, we went up there last July to find out just what dairymen think about this crop and to persuade Smith to tell Hoard's Dairyman readers about the best ways of growing and utilizing the crop for cow pasture.

Top: Typical sweet clover pasture scene in Manitowoc County. Oval: R. R. Smith who, as county agent, has helped sweet clover tell its own story. Bottom: Good fall pasture is frequently secured from seeding sweet clover with oats or barley.

We were there in July, a time of year when native pastures were closed up for the annual midsummer vacation. We drove with Smith all over the county from east to west and north to south. We saw many good sweet clover pastures and by comparison we saw why Smith had waged such a hard fight to give cows something better than they had been getting. On one side of the road we saw cows contendedly resting in sweet clover after they had grazed what feed they wanted; on the other side of the road we saw cows up and working away diligently at native pasture in hope that they might find enough to satisfy their desire for feed. In many such pastures it would have taken a lot of leg work and mouth action to get enough.

What do these dairymen think of sweet clover after they have tried it?

August Schnell says, "I found five acres enough for fifteen cows. I always feed a little grain. I like sweet clover because it is early. I turn my cows on when the clover is about four inches high and before they have a chance to graze any other kind of grass. In this way I find the cows learn to eat the sweet clover readily. Later I can turn them on other pasture. I never allow my sweet clover pasture to get more than six inches high. Besides being a good cow pasture, sweet clover is an excellent soil builder. It will grow on some low land where native grass will not do so well."

George Prince has had sweet clover for three years and has twenty acres for 1927. He provides one-half acre for each cow. He does not feed grain while cows are on sweet clover pasture. He seeds the white biennial kind and would not do without it.

Joe Svacina says, "I had sweet clover in 1925 and 1926. Last year I had five acres for seventeen cows but I fed some grain. The milk flow was very good. I would not farm without it."

In 1925, O. R. Wiegand had fifteen acres for 24 head and they could not handle it. He says, "In 1926 I had ten acres for 21 head which was just about right. I fed some grain and silage but cows would not eat much silage. Milk flow held up fine on sweet clover. Would not advise sowing sweet clover alone for pasture. Put in a little timothy, red and alsike clover."

C. M. Madison says, "I have used sweet clover for the past six years and would not be without it. I provide 1½ acres per cow without summer feeding and one acre per cow with summer feeding. I have grazed my cows on sweet clover with and without supplying some grain. The milk flow holds up very well in either case but of course the cows are kept in a little better condition when some grain is fed. I have found that sweet clover gives me the earliest pasture and it holds up well until about August first. The last two years I have sown a little timothy and alsike clover with it and this provides some pasture after the sweet clover is spent. Sweet clover sown with grain in the spring makes a good fall pasture besides coming on again the second year when it makes its greatest growth. I keep some bees and the sweet clover helps me to kill two birds with one stone."

In 1926, Elton Morgan provided one-half acre for each cow but it was not sufficient, partly because of unfavorable growing conditions. In 1925, he fed some grain but not in 1926. He thinks some grain should be fed. He says, "I am all for sweet clover pasture. I have ten acres for 1927 and wish I had two or three more. I never had pasture that stood up so well or gave as much feed per acre."

Bernard Fetzer says, "I had sweet clover pasture in 1925 and 1926. Last year I had five acres of sweet clover and seven acres of red clover and timothy for 24 head. I did not feed any grain and the production of my cows was good. I am strongly in favor of sweet clover pasture."

Tesarik Bros. have had sweet clover pasture for two years and are well satisfied. They had eleven acres for 21 cows. The milk production was very satisfactory.

There are thousands of dairymen who know they need better pastures. They have not had a Bob Smith to lead the way and get some evidence in the communities where they live. They are on the fence—afraid their cows won't eat it, or that if they do it will taint the milk, or that they can't get a stand, or even that if they do seed it they will never be able to eradicate it from their farms.

We have purposely given the testimonials of these Manitowoc County farmers to make these "on the fence" farmers want sweet clover pasture just a little harder—enough so they will begin to lean in the right direction.

We have asked Bob Smith to finish this article telling how to get a good stand of sweet clover and how to utilize it to the best advantage. We know of no one better qualified to do this than he because of his work in Manitowoc County:

"In Manitowoc County we have certain set rules in mind as to the rate of seeding, use of lime, acreage provided per cow, and the time at which to turn in the cows for the first time in the spring. We fully appreciate that these rules must be adjusted to meet weather, soil conditions, and other factors.

"The above testimonials from this county tell the story. Our farmers have had very good success by seeding sweet clover in the spring with oats, barley, or canning peas as a nurse crop, with the plan to pasture light that fall in some cases and heavy the following year. The rate of seeding for best success varies all the way from ten to eighteen pounds per acre. We have found the scarified seed of the white biennial kind best. On comparatively rich, well drained soil we find that ten to twelve pounds of seed give very good results and on the poorer, sandy types of soil fifteen or sixteen pounds per acre prove most satisfactory. We find that best results with pasture are obtained where the plants do not stand so close together that the lower leaves and limbs smother out as is the case with too thick a stand.

"We further appreciate that it is to advantage to have the correct acreage provided per cow if possible. On heavy, fertile soil in Manitowoc County an average of two-thirds of an acre per cow is plenty if the stand is good. We have some cases when seasonal conditions were favorable; where one-half an acre was sufficient per cow, while in other cases when soil was rather sandy and low in fertility it took as high as one acre.

"The time of letting the cows on for the first time in the spring is also a big factor. In most cases putting cattle on sweet clover pasture for the first time in the spring when it is six to ten inches in height is advisable. If the weather is warm and there is plenty of rain at this time it may prove detrimental to allow the plants to get as high as ten inches, especially if the acreage is rather large for the size of the herd. This precaution may be mentioned simply because sweet clover grows so fast in the spring that a small herd on a large acreage

ould not be able to keep it down. eeping it down to less than a foot in ight is necessary for best results.

"As to the use of lime we find it ential on acid soils. Applying lime cording to the amount indicated by e acidity test of the soil is a fairly pendable guide. Where sweet clo- r or alfalfa has not been grown, in- ulation is essential.

"Sweet clover for pasture has prov- a remarkable success during the st four years in Manitowoc Coun- and it is reasonable to believe that e present acreage will be doubled ny times over within the next few ars."

Roughage for Wintering Southern Dairy Heifers

HOARD'S DAIRYMAN:—That dairy ifers can be wintered in the South roughage only without serious ecking of skeletal or body growth indicated in a trial recently con- cted at Clemson College by J. P. Master, Chief of the Dairy Divi- n.

Eight dairy heifers whose average e was 381 days were fed on a ra- on consisting of roughage only for period of 90 days. These heifers ere kept in a one-acre lot with an en shed as the only shelter. An- ther group of eight heifers, with an erage age of 382 days, was fed for similar period on a ration consisting roughage and grain and housed ring the night in the regular dairy rn. Both lots of heifers were ighed and measured at regular in- rvals to determine their respective tes of growth.

The roughage fed consisted of soy bean hay and corn silage for the first sixty days, and oats and vetch hay and sorghum silage the remaining thirty days. The silage was fed in the morning and the hay in the afternoon.

Lot No. 1 on roughage only, averaged 90.4 per cent normal weight and 96.4 per cent normal height at the beginning of the trial. At the end of ninety days they were 91.7 per cent normal weight and 97.4 per cent normal height.

Lot No. 2, with an initial average for weight and height of 88.0 per cent normal and 97.9 per cent normal respectively, at the end of the ninety days had increased their weights to 93.8 per cent and heights to 100.7 per cent normal. The heifers receiving the grain ration gained .39 lb. more per day than those on roughage only. The daily difference in height growth was .009 inch for the entire group in favor of the grain-fed heifers. Normal skeletal growth in immature animals is of more importance than body weight.

South Carolina. A. B. BRYAN.

(EDITOR'S NOTE: Readers should bear in mind that the above experiment was carried on for only 90 days and that these heifers were nearly normal to begin with. While it is important to grow dairy heifers as cheaply as possible, it is likewise important to secure full normal growth when the growth stimulus is at its greatest intensity. The experiment indicates that *good* roughage will produce normal growth, at least for a short period. One should *not* attempt to grow dairy heifers on poor roughage.)

The Testin' Club

A while back in our domain
They started up a big campaign
To make a testin' club er two
To show us what our cows would do.
The county agent give a speel
That helped to consummate the deal,
And finally some of us give in
And said we'd try it, lose er win!
'Twas quite a step fer us, I guess,
Because they had it in the press,
And business men from here and there
Commended us on the affair.

They got the tester right away
Who guaranteed to come and stay
Once every month a day or so
For which we antied up the dough.
We got some high falutin' scales
On which to estimate the pails
Of milk we got from every cow
At every bloomin' milk pow-wow.
And then we had to write that in
A little book they give us men
And keep it choice agin the day
The tester happened round our way.

Well, when he got around to us,
Mari and I both liked the cuss
And thought it pleasant-like of him
To help us in our dairyin'.
He went out to the barn that night
And told me what he 'lowed was right
In feed and such to make a cow
Produce the most from bin and mow.
He weighed the milk and weighed the feed
Each special critter seemed to need,
And in the morning did the same
Accordin' to the testin' game.

Well, afterwards he figured how
The records stuck on every cow;
Which struck Mari, she'll always hold
The same as gettin' fortunes told.
Well, when I saw my cow display
On paper, in the tester's way,
I sorta figured in my head
It sure was like Mariar said.
For some of them had given back
Their feed and quite a little jack;
And others, in the figures failed
Producing what their feed entailed.

Well, all of this was news to me,
But yet it all soaked in, by gee,
And I decided then and there,
I'd put an end to that affair,
And since I've tried the testin' way
I've made the rule, each cow'll pay
So much to me to milk and stew
And fuss around her like I do.
And when I contemplate the day
I doubted testin' worth its pay,
I see I missed the big idee
Because the testin's payin' me!

EMPIRE

Milking Machine

– milks like a sucking calf

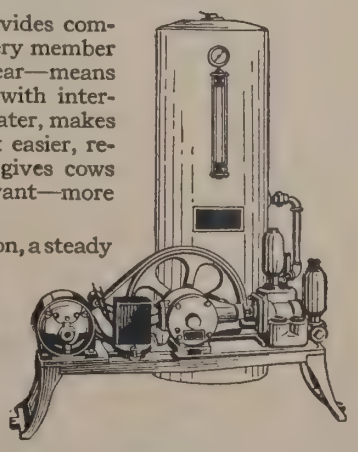
BECAUSE Empire Milking Machines reproduce the calf method, cows give down milk in greater quantity each day and for more days—pay bigger milk dividends.

One person easily does more milking than two or three expert hand milkers. You get clean milk with a low bacteria count—easy to operate, easy to keep clean.

You bank the cost of wages and keep of a hired man whose work the Empire does. Sold on easy payment plan. Makes dairying a better, more profitable business. Send for booklet—mail the coupon today.

◆ ◆ ◆

The new B B Marvel Cream Separators get all the cream all the time—and last longer



The improved and permanently balanced bowl of the new B B marvel represents the greatest separator improvement in a quarter of a century. Troublesome neck springs and bushings have been eliminated. The bowl is mounted on an automatically oiled ball bearing spindle, supported by a stationary shaft. Perfect, permanent balance, freedom from vibration and tilting, which waste cream, practically frictionless operation—guarantee *all the cream all the time.*

Run skim milk from any other separator through a B B Marvel and you will want the extra cream it separates. A right size for every herd. Sold on easy-payment plan. Mail the coupon today.

◆ ◆ ◆

Running water in house and barn for a few cents a day

The Empire Water System provides comfort, saves work and time for every member of the family, every day in the year—means bathroom comforts, does away with interminable pumping and lugging water, makes kitchen, laundry and dairy work easier, reduces fire insurance premiums, gives cows and hogs all the water they want—more milk, heavier hogs.

Easy to install, silent in operation, a steady flow at any faucet, motor, pump and tank equipment with 300 gallons an hour capacity—comforts and conveniences only running water can supply for about a nickel a day. Sold on easy payment plan. Mail coupon today.

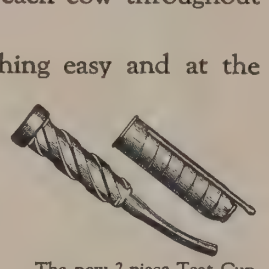
Increase Your Milk Check

"THE first month after I gave up hand milking and began to use the Perfection my cows gave 501 pounds more milk. The second month I got an increase of 525 pounds", writes a Perfection user.



This is what the Perfection Milker has been doing month after month, year in and year out, for fourteen years. It not only increases the size of your milk check on your present herd because of increased milk flow, but relieves drudgery, saves time and allows you to increase your herd without additional labor.

Two of the reasons for these remarkable increases in milk production are the exceptionally low vacuum and the fact that you can regulate the milking action to suit each cow throughout the entire lactation period.

The new two piece teat cup makes washing easy and at the same time milks faster, cleaner and with less vacuum.

The Perfection is said to pay for itself more quickly than any other milker and we will arrange terms of payment to suit you.

Send for our new catalog and learn how to increase your milk check at once.

The new 2 piece Teat Cup. One Pull and it is all apart for quick and easy cleaning.

News from Washington, D. C

[SPECIAL TO HOARD'S DAIRYMAN]

Washington, D. C., Feb. 24—With Congress adjourned and gone home, probably to stay at home until December, Washington settles down to routine business. Most of the business of the government is handled through the administrative departments and it is a noticeable fact that when Congress is in session this activity slows down and then speeds up after congressional adjournment. Of course, this observation does not apply to the field work, which after all is the real basis of the service work of the government, as different from the purely administrative work, such as is represented by handling the revenues, carrying on Department of Justice activities, etc. In the Bureau of Dairy Industry there has been very little change this year due to the business of Congress, only that incident to the proper presentation of its budget and the hearings relative to this budget and the appropriation bills. In general, Congress has paid less attention to Department of Agriculture matters than usual, indicating that the routine and service work of the Department meets approval and has not resulted in investigations or interruptions.

President Coolidge signed the Lenroot—Taber Milk and Cream Import Bill after a very brief period of consideration, holding it up long enough to give Health Commissioner Harris an opportunity to present objections. After hearing Dr. Harris, the President also heard Senator Lenroot explain the bill and its purposes, and he signed it the following day. The Budget Bureau approved a request for $15,000 appropriation to set up the inspection service necessary under the bill, and this item is included in the final deficiency bill passed by Congress just before adjournment.

The next big dairy event in Washington will be the annual Dairy Pilgrimage, under the auspices of the American Dairy Federation, April 26, 27, and 28. This date is a week later than originally announced, the change having been made to avoid the big Easter week crowds which flock into the national capital.

The American Dairy Federation announces that special rates have been granted on all New England, Central Passenger Association, and Trunk line railroads for the Dairy Pilgrimage.

Preliminary announcements have been received here for the eighth World's Dairy Congress to be held in Great Britain in July, 1928. The preliminary announcement of the general committee of the Congress states that sessions will be held in London, Reading, Edinburgh, and Belfast. The meeting will be under the patronage of His Majesty, King George.

The progress of tuberculosis eradication is strikingly indicated by two announcements which have come almost simultaneously from two different divisions of the government, one announcing the results of a survey which shows that 874 cities now shut milk out which does not come from tuberculosis-free cattle, and the other which announces that 19 additional counties were declared to be free from tuberculosis and placed in the accredited class in January. Besides the 874 cities requiring T. B. free milk, there are 375 more which require either T. B. free milk pasteurization. This makes 1,2 communities in which there has b definite action along this line.

So much has been said in the da press about the McNary—Hau Bill that there is not much more say about it, except that it raised an acute political issue wh seems to overshadow the agricultu questions involved. The votes the bill very nearly lined the East against the West, with the south vote nearly evenly divided. O one congressman and one senator Wisconsin voted against the Voight and Lenroot. One lone c gressman from Minnesota vo against, Newton of Minneapo Both Iowa delegations were solid the bill. The dairy industry seer to play no part in the vote, as da states to the eastward went as soli against the bill as the dairy st to the west went for the bill. dairy interests were frequer brought into the debate, and a s ous argument started as to the fluence the bill might have if worked as expected on the matter the price of dairy feed. Congr man Dickinson contended that as wheat feeds it would not incre them, feeds having no relation wheat prices, but rather being termined by the amount of milk done in this country, which wo probably be increased. Other spe ers insisted that corn would be creased in price. Southern congr men did not think that even a cessful carrying out of the prop of the bill would increase the p of cotton seed.

Reports are received at the o of the National Dairy Union strong efforts to get better anti-o margarine legislation in Iowa Missouri this winter, and of an ef in Pennsylvania to weaken the o margarine law in that state by e inating the provision for a retail license. This effort in Pennsylvia is a repetition of one made a yea so ago, and defeated after a fight by the dairy interests. It is in Pennsylvania that the only wa keep an accurate check on whe or not the buyers are deceived a what they are buying, is by clo checking up the retail sales pla and that this can not be done u they are registered so the inspec know where to go to make ins tions. Indications are, accordin reports here, that a new law wil enacted in Iowa. There are no reports from Indiana.

J. D. Hull of Indiana, again won sweepstakes at the Indiana Corn Show held during the Purdue University Agricultural Conference. He won on ten ears of Johnson County White. His prize winning sample was selected from a 40-acre field which averaged nearly 90 bushels per acre.

A FARM AFLOAT

GEORGE CECIL, FRANCE

THE owners of Greek steamers having experienced a difficulty in retaining the services of the crew, a most happy thought has occurred to the captain of a tramp vessel, the "Nicholas Athanassoulis." This farseeing mariner, perceiving that a well nourished stomach is the basis of contentment, suggested to the firm which he serves a means of persuading the officers, engineers, and able seamen under his command to sign on for an indefinite period. "Salt pork and canned goods," he said, quickly prove uninteresting. Fresh meat, fresh vegetables, and new-laid eggs must take their places. And tinned milk is not to be compared with that which is drawn straight from the cow."

The owners, while agreeing with the benevolent-minded skipper, could not find a way out of the difficulty. But the captain was equal to the situation. "We ought to carry a farm aboard," was his solution. At first the firm was aghast at the idea, for Greek shipowners invariably abominate anything in the way of an innovation. Finally, upon it being pointed out to them that proper food meant a cheerful and healthy crew, they sanctioned the experiment. The captain went on his way rejoicing.

A few days later, the "Nicholas Athanassoulis" left her moorings, every face wearing a smile. And from the lower deck there issued the sounds of mooing, clucking, and baaing. The black cook's honest countenance was positively alive with a wide grin.

The farmyard freight includes roosters and hens, the productive birds being accommodated in a miniature fowl-run amidships. In a pen, near the forecastle, there are fifteen sheep or, rather, were fifteen for during a two months' voyage the ship's butcher has accounted for twelve of them. The fowls also have diminished in number, several having clucked their last cluck. The cook, however, is under instructions to cut short the lives of those which have proved themselves disappointing layers. The hens are spared provided they do their duty, the crew being extremely partial to omelets. Sambo exercises discrimination.

On Sundays, fowls always figure in the officers' menu, for the Greek sailors almost look upon them as game. Boiled, cut into tiny pieces, and served on a bed of rice slightly flavored with cinnamon, the dish is known as pilof. A small cask of the national wine also is broached in honor of the festal occasion. Chicken and white wine may be thought an expensive luxury aboard a tramp steamer, but the owners, recognizing that Sunday comes only once a week, have bowed to the inevitable.

Three cows are carried, for though two are sufficient, the captain, like a wise general, believes in "supports" in case of accident. Meanwhile, the crew revels in milk puddings.

The vegetable garden, which is decidedly a success, is in the quartermaster's special charge, he being an expert kitchen-gardener. Unfortunately, limitations of space prevent the expansion after which his soul craves; the huge boxes, which take the place of beds, rather get in the way. Beans make a brave show, as also do the carrots and parsley border.

Reports of the success achieved by the farm afloat having reached Greece, there is a talk of other steamers being fitted out in the same manner. So much the better for the crews.

SILVERWOOD DIANA—WORLD'S RECORD GUERNSEY

THE recently completed record of 20,006.4 lbs. milk and 974.8 lbs. fat made by Silverwood Diana makes her the world's highest producing Guernsey cow in class AA. She began her test at the age of eight and one-half years, and carried a calf for 281 days of the testing year.

This great cow is owned by William H. Williams of New York, and was bred by S. H. Fessenden of Massachusetts.

She is the fifth cow of the breed to produce over ten tons of milk in a year, and she displaces the former world's champion in this class by just six pounds fat. Incidentally, the former champion is Golden Coronet of Jean Du Luth, her own stablemate. Diana averaged a ton of milk a month for her first six months, and her highest day's milking was 76.5 lbs. As a senior four-year-old, she made a record in 1922 of 16,092.0 lbs. milk and 733.79 lbs. fat, so her present record was not unexpected. She is the mother of five daughters, of which one is on test, two more will be tested at their next freshening, and another was junior champion female at the 1926 Eastern States Exposition.—The American Guernsey Cattle Club.

California ~
the third greatest
farming state-*needs more farmers*

IF YOU are a good farmer, and have enough capital to give yourself a fair start, California can promise you a premium market for a big share of the things you raise—and a soil and climate that will raise more of them, at less cost, than you do now.

California pays you, for example, 20 per cent more for your butterfat than the average quotations throughout the United States, because the 75,000,000 pounds we produce now is not enough and we have to buy 22,000,000 pounds more every year from other states.

We raise only 25 per cent of the pork we eat, and bring the rest from as far away as the Middle West. Of course we have to pay $1.60 to $2.00 a hundredweight more for freight—and the California farmer gets the benefit.

The kind of farmer California needs is the man who will bring more California butter, poultry, hogs and fed beef to our markets. Barley and grain feeds are cheap; your own acres will supply green feed all through the snowless winters. Your dairy cows will produce the highest butterfat averages in the United States; your poultry can be out of doors all winter; you can count on two litters of pigs each year in California's year-round foraging climate.

Where Life is Better

And—important as it is to know that you will make a better living—you will find that this living is full of comforts you have never known. The golden oranges that you can pick from your own trees on Christmas Day and the roses blooming beside your porch in midwinter, when icy winds are sweeping over snowed-in homes "back East," will make you glad that you discovered California.

Here are rural schools that rank as the finest in America; electrical conveniences of every kind on almost every farm; paved highways and excellent transportation; a metropolitan district on San Francisco Bay where more than a million people live; large thriving cities and clean progressive towns every few miles throughout the Great Valley and the neighboring valleys; a prosperous population whose average wealth, average income and average number of automobiles are twice as great as the average for the rest of America.

Low summer round-trip fares to California beginning May 15—a great summer trip for $90.30 from Chicago, and correspondingly low rates from all other points.

This brief picture of opportunity is told more fully in an 84-page booklet published by Californians, Inc., a *non-profit* organization of citizens and business institutions interested in the development of the state. Send the coupon today for your copy of this interesting book.

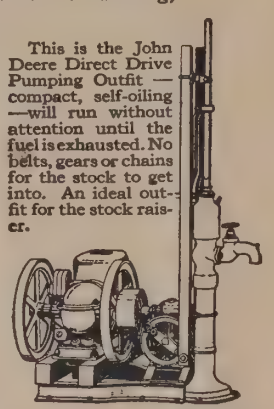
Which Farm Engine Would You Choose?

If you were given your choice between two farm engines—one with its cylinder, gears, bearings and other important parts exposed to sand, dust and dirt, one having a number of grease cups and oilers to fill, adjust and watch;

—another engine with all of its important parts (cylinder, bearings, gears) all **completely enclosed in a dust-proof case,** with a **simple automatic oiling system** that **does away with** all **grease cups and oilers**—an engine that will run until the fuel is exhausted without one moment's attention—



—wouldn't you choose the latter?

The John Deere Type E

is the enclosed engine that oils itself. It has set new standards in farm engine building. Its longer life, smooth running, lower upkeep costs and ease of operation result in time-saving and money-making advantages you want in your engine.

Be sure to see it on display at your John Deere dealer's. Ask him to run it for you. Built in 1-½, 3 and 6 H. P. sizes.

For years to come it will always be ready to save time and money for you on your lighter farm power jobs.

This is the John Deere Direct Drive Pumping Outfit — compact, self-oiling —will run without attention until the fuel is exhausted. No belts, gears or chains for the stock to get into. An ideal outfit for the stock raiser.

WRITE FOR THIS FREE BOOKLET
This tells all about this remarkable farm engine and fully illustrates its construction. Write for this. Address John Deere, Moline, Ill., and ask for booklet WS-714.

Opinions, Brickbats, and Bouquet

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative. destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

What Should Education Mean

HOARD'S DAIRYMAN:—What should education mean in our homes? Being a teacher myself I have tried to find out whether or not education is bettering our home conditions. I find that it does and does not!

By the term education I do not merely refer to the three R's, "reading, 'riting, and 'rithmetic." Education today should mean far more than this—but does it? Seeking knowledge and learning from books are only a part of the task of educating. When the results of education are knowledge *plus* outward and inward cleanliness, politeness, respect for law, order, and authority, a desire for the things that are right and worth while in this world, a cheerful and willing attitude, high ideals—then and only then shall education have a direct influence in making the home a better place to live in.

Randall J. Condon, president of the Dept. of Supt., N. E. A., says: "Teach that which gives intelligence and skill, *but* forget not soul culture, for out of this comes the more abundant life bringing forth the fruits of the spirit. These are the real fundamentals in education, for character is higher than intellect and the soul shall never die."

Henry Ward Beecher says: "It is not work that kills man; it is worry." It is true. Very few people work themselves to death, but many die from worry. Education should also teach us to work more and worry less. The best place to teach this is in the school room.

And so I shall close this article with the question—What does education mean in your home?

Wisconsin. L. G. THOMPSON.

Favors McNary—Haugen Bill

HOARD'S DAIRYMAN:—In your editorial of January 25, opposing the McNary—Haugen bill you state, "Manufacturers whose products are protected by a tariff would not be benefited by it if they overproduced, and we do not comprehend how agriculture can expect to receive protection from a tariff when it overproduces."

On the contrary, years ago I was told that American made steel rails sold in Canada for four dollars a ton less than in the United States Mr. Howard, when president of the National Farm Bureau, was quoted as saying that he could buy in Russia a binder made in Chicago, Ill., and pay the freight back to his Iowa farm for less money than he could buy a binder of the same make in Iowa shipped direct from Chicago. My information concerning steel rails is supported by testimony given two years ago before the Agricultural Committee of the House of Congress on the McNary—Haugen bill hearing.

The U. S. Steel Corporation recently declared a stock dividend of two hundred million dollars. This is 40 per cent on stock which was one-half water when corporation was organized in 1901. The Fair Tariff League says that the tariff added to market control by the corporation makes the American price equivalent to the English price, plus the duty of 27 per cent, plus the freight to New York, plus 16 cents a pound for good measure!

I recently read, I think in Hoard's Dairyman, that in Australia, whose surplus butter is shipped to Engla at a cost of 7 cents a pound whi acts like a tariff, the creameries paying a bonus of 7 cents a pound all butter shipped to England we able to raise the price of the great bulk of butter consumed at home such a degree that the average pri of all butter manufactured was rais six cents or one cent under the En lish market, though previously it h been 7 cents under.

Congressman Brigham's arti seems concerned with the fear th the McNary—Haugen bill will ra the price of western foodstuffs f by Vermont dairymen. My fath was born in that part of Vermo where Mr. Brigham lives and oft as a boy climbed Brigham Hill grandfather, Nelson Kellogg, w born on same farm in 1800. Comi west from Vermont I hope I ha acquired a wider and more natio view than Mr. Brigham, bred for g erations and reared inside th stone walls which seem not only confine and burden the fields but t mental powers as well. Western w fences permit a wider view. Consi Congressman Haugen of Iowa a Senator McNary of Oregon.

California. R. D. KELLOGG

Equalization Fee Will Control Production

HOARD'S DAIRYMAN:—Your resu of the McNary—Haugen measu I think, overlooks the vital f tor, viz., the application of the equ ization fee to control producti As Representative Adkins of Illin said, that is its "soul and life."

The Curtis—Crisp—Fess—Jarde and other measures that leave ts feature out are open to the objecti you raise because of failure to c trol production. We have ordinary a domestic consumption of 600,00 000 bushels of wheat and expt 200,000,000. Inflated currenc and lower standards of living a prices abroad make the 25% export determine price of the 75% co sumed.

The U. S. has a higher standard wages and yet objection is made o any plan for an American agricultural price scale on this advanced industrial wage. The equalization would, with adequate loans on standard products, store the surpl until needed for export or domes consumption and as the equalizat fee would proportionately advance as the surplus accumulated, it would e nalize overproduction. A carry-ov of an additional 100,000,000 bus would add 25 cents per bushel o the preceding years' equalization in all probability There is exa the point of a reasonable contro production, viz., it allows the pro ducer at least a year to get "in a justment" to demand and is so notice to the consumer that the ad justment will be made for the fu but not at the expense of the pro already produced. Assuming an intelligent attitude by the produc the corporation in charge of th product would increase the equa tion fee to cover the carrying char of two crops instead of one penalize the units that came to ma ket.

The mathematics of this is tha the surplus approached one-half o the annual consumption it wil negative any possible gain. Sinc the fee is collected as marketed it

ould restrain forcing the market ith products ahead of demand. Any ite of insurance depends on the loss atio. Market price stability depends supply not forcing itself on de- and and this is just as effective by ell financed storage and a reason- ble acreage control as by an actual mitation of product.

Those who advocate an actual lim- ation of crops are assuming a more angerous position and really not ossible in practice. Nature simply oesn't work that way. A 10% over- upply or the same percentage below ur needs is possible from the same lanted area. Capital is the result of roducing above consumption and the roblem is to conserve this surplus ntil needed. History has shown that w staples are in excess over a period f three years.

There is no such law as supply and emand but some relation thereof. supply was always kept untram- elled by any laws and demand al- ays constant, these relations would ore nearly equal. Supply and de- and are but two viewpoints of the me thing from different stand- oints. The McNary—Haugen bill is o make a more constant flow to con- mption demands by reservoiring the rplus and supplying as demanded. here is no price fixing by the U. S. y Congress or anyone in anyway fferent than organized industry oes at the present time. The ommodity body on wheat, corn, or otton would be a constant factor nd would take the surplus off the arket and would probably establish minimum price. As state market rector in Michigan in 1916, I draft- d the plans for the Michigan milk producers' organization, an account which appears in your issue of Jan. 25, page 70. This is a collective bargaining body of producers who collect a fee for administration purposes and establish a basis for surplus products at a lower level than that for milk used in the fluid trade.

The plan has worked for 10 years. It has this merit—the small surplus is segregated and its weight not allowed to depress the whole market. This fact has been a great factor in adjusting production to fluid milk demand. The producer has an equal right in fixing prices as does the distributor. What he lacks is the effective machinery. Surplus control is that piece of machinery. The weakness is the great number of units in production and no method of unity in action without compulsory co-operation, which is, after all, a government function. The unharmonious administration of our railways was coordinated under the control of the Interstate Commerce Commission and a measure of price fixing obtained. The Federal Reserve Board unified the national banking system including indirectly all banks. Discounts are raised or lowered. The tariff was raised on butter to prevent the products of a lower waged product from other countries. It was but a few years ago, when the butter tariff was lower, that a few ship loads of butter from the Antipodes broke the whole butter market of the U. S. This shows how a small surplus with no reservoir to restrain reduces the whole body of product in price. The dairy interests of the U. S. could have well afforded to have bought these cargoes and destroyed them if necessary. The remedy came by government action and not by dairy organization.

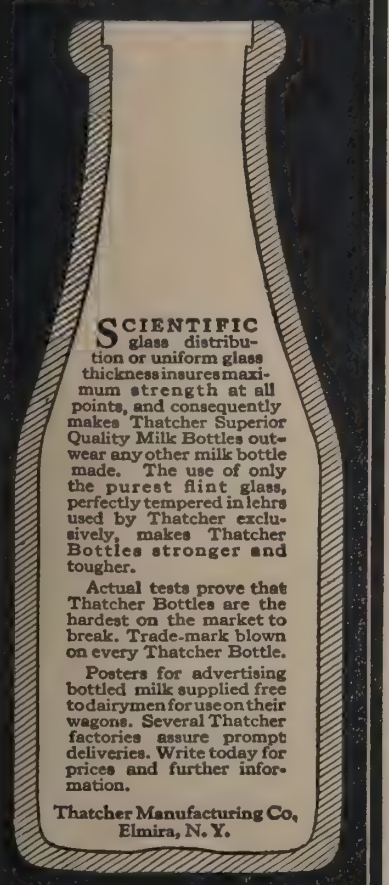
One may well ask why the dairy industry objects to allowing effective restraints on foreign price making of American products in our domestic markets. The dairy interests were granted this protection on butter without protest from those producing the great staple cereals, meals, and textiles. Do you want the southern cotton grower and the western grain grower to change and become dairymen and produce a domestic surplus?

Michigan. J. N. McBRIDE.

Rigid Selection

HOARD'S DAIRYMAN:—I was reading the article, "Failure of the Pure-bred Business," in the current issue of Jan. 25. It seems to me the situation of the pure-bred business is summed up by Mr. Prentice in those few words, "Through rigid selection based on profitable production."

When I went to buy a registered sire two years ago I was amazed to learn that a Jersey cow was only required to produce 250 lbs. of fat to enter the Register of Merit. The man who wanted to sell me a bull boasted that his dam had produced 290 lbs. of fat in her first lactation period. That was on three-times-a-day milking and all her feed carried to her on a scoop.



At that time I had a grade Jersey that produced 340 lbs. of fat in her first lactation period under common ranch conditions and on twice-a-day milking. During the pasture season she rustled her living in a brush pasture.

When the pure-bred breeders raise their standards and insist on "rigid selection based on profitable production," they will have made a big step forward. And that applies to all of the dairy breeds.

Washington. RALPH C. GREEN.

The most severe test of friendship is whether it will stand a loan.—Good Hardware.

Use The Milk Bottle Scientifically Constructed to Resist Breakage

SCIENTIFIC glass distribution or uniform glass thickness insures maximum strength at all points, and consequently makes Thatcher Superior Quality Milk Bottles outwear any other milk bottle made. The use of only the purest flint glass, perfectly tempered in lehrs used by Thatcher exclusively, makes Thatcher Bottles stronger and tougher.

Actual tests prove that Thatcher Bottles are the hardest on the market to break. Trade-mark blown on every Thatcher Bottle.

Posters for advertising bottled milk supplied free to dairymen for use on their wagons. Several Thatcher factories assure prompt deliveries. Write today for prices and further information.

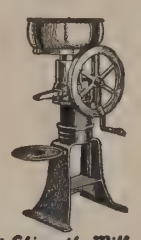
MILK BOTTLES

A scene sketched from a photograph taken on the farm of Charles Scothan, Lee Center, N. Y.



This Pulsator Gives Teats *Complete* Rest Between Sucks

It Milks the Cows Clean

"During my long experience with the Burrell Milker, my cows' teats and udders have kept in excellent condition. I believe this is mainly due to the way in which the Burrell Pulsator gives complete relief to the teats between pulsations."—Charles Scothan, Lee Center, N. Y.

NATURAL circulation is essential to keep the teats and udders of your cows in good condition. A long period of suction, without complete relief, causes congestion, and teat and udder trouble. Nothing except *complete* relief is safe.

It Skims the Milk Clean

For many years, the wonderful Link Blades of the Burrell-Simplex Cream Separator have made it famous as the *closest skimmer*. It has a greater capacity for the size of its bowl, for the speed at which it is operated, and for the power required to run it than any other separator. It is simple, light and easy-running. But, above all, *it skims the milk clean*—and that's what you want in a cream separator. Four sizes—350, 500, 750, 1000 lbs.—hand or power driven.

Safeguards Your Cows

The Burrell Positive Relief Pulsator creates sharp, definite, positive, intermittent periods of *complete* relief. Between sucks, the vacuum in the teat cup drops completely to zero, the teat hangs free, and circulation is normal and natural. This feature of the Burrell Milker safeguards your cows, and it alone is sufficient to justify your choice of the Burrell Milker.

4 Exclusive Features

There are four exclusive features which make the Burrell the *perfect* milking machine. The first three are interdependent—each increases the efficiency of the others. (1) The *Automatic Controller*, which regulates the suction to suit exactly each individual cow; (2) the *Air-Cushion Teat Cup*, which supports and compresses the teats by air alone; (3) the *Positive Relief Pulsator*, which gives complete rest between pulsations and assures natural circulation; (4) the *Sanitary Moisture Trap*, which entirely prevents contamination from the pipe line.

The Burrell Milker is noted for its simplicity. It is a single tube system, with only half as many rubber parts as the ordinary type of milker.

Send For Valuable Free Books

Here are two valuable, illustrated books that are free to dairymen. One pictures and describes the Burrell Milker and explains how "*It Milks the Cows Clean*". The other tells about the Burrell-Simplex Cream Separator—all about its simple, sanitary, rugged construction, and how "*It Skims the Milk Clean*". Every dairyman should have both of these interesting, practical, helpful books for handy reference.

UNIVERSAL BATTERIES

THE STORY OF SEAMAN

FRANK M. CHASE, ILLINOIS

THIS is the story of Seaman. It is the story of a teacher, of the school that he built, and of the community which they, together, transformed. I have written this story a half dozen times and discarded each draft. In my previous attempts I failed because, I think, I tried to emphasize the teacher, the school, or the community. The story is not of one of these, but of all of them. I also tried to draw conclusions, to point out lessons. That is unnecessary, for the things which have been done in this community speak for themselves. So I shall set down, as simply and as truthfully as I can, the facts about this teacher, this school, and this community, and leave you to draw your own conclusions.

It all began about ten years ago, when Fred A. Seaman became principal of a district school along the outskirts of North Topeka, Kansas. The school was just an ordinary four-room school, in an ordinary rural district. But Seaman was, and still is, no ordinary teacher, and to him this school spelled opportunity.

About him boys and girls were leaving school at the end of the eighth grade, some because they could not go to the city schools and others because they could not obtain the kind of schooling they should have. This should not be, Seaman thought, and, he himself being able to teach several high school subjects, added two years of secondary work to the elementary instruction under him.

The patrons liked this move, and Seaman felt encouraged to go on. For a while he entertained the idea of consolidating the schools of four districts. A rural high school seemed to offer a greater measure of community service, however, and presently he was at work to make this a reality.

During most of his thirty-five years of teaching experience, Seaman has farmed as well as taught; and at that time he was living on, and operating, a farm of several hundred acres within the area which would be taxed to build the proposed high school. The fact that he was asking no farmer to shoulder a tax burden which he himself was unwilling to carry added force to his argument. Other conditions were favorable and, in due time, in 1919, bonds for an $85,000 school plant were voted.

While the building was under construction, the year following, Seaman, believing that his work in the community was over, accepted a position in the office of the state superintendent of schools. When it came time to select a principal for the new school, however, the choice fell upon Seaman, and he was besought to take the place.

He hesitated. As a state official his ideas on rural education were having a wide scope. On the other hand, he knew the power of example. Moreover, as a teacher and farmer, Seaman had dreamed ever since boyhood of the kind of a rural school he would have if he could build it. And here was his chance to do so.

Not without reason was Seaman recalled to direct the high school which he had built. In the course of his labors in the community he had won a secure place in the hearts of the people, and they sincerely wanted him back. The depth of their affection for him perhaps is best indicated by the fact that the school now bears his name.

It happened this way. Seaman had been principal but a short time when, one day, the board asked if he would not get up a list of possible names for the school. This he did and, through the pupils, submitted them to the patrons whose wishes were to be voted by the pupils.

At the assembly called for this purpose the names were again presented and a discussion of them invited. The youngsters didn't have much to say for a moment, but finally the principal was asked if he would not leave the room. In a few minutes he was called back.

"Mr. Seaman," said the pupils' spokesman, "it is our unanimous wish

FRED A. SEAMAN

as well as that of our parents, that t school be called the Seaman Hig School."

The slender, gray-haired man at t front of the room almost broke dow It was a struggle to keep the tea back. Pulling himself together, ho ever, he protested with all his migh But it was no use. The pupils kne what they and their fathers and mot ers wanted, and nothing the principl could do would change their minds.

Far from giving Seaman an exa gerated idea of his own importan this evidence of faith in him only i creased his desire to serve the co munity. He *has* given his best to and in doing so has turned, perha a bit of new ground in rural educ tion.

Within the forty-eight sections co prising the high school district we grain farmers, stockmen, potato gro ers, truck gardeners, dairymen, g farmers, and little farmers. The d trict also included city as well s rural residents, with the high schl students dividing about equally t tween town and country. To meet te educational needs of a population o diverse was indeed a problem. Nev theless it has been met.

"From my acquaintance with e people," Mr. Seaman explained, I knew that few of their children wo d go to college. On the other hai most of them would end their sch ing in the community in which th began it. The purpose of Seam High School, therefore, as I saw t was to prepare them for citizenship the work-a-day world about them.

"For this reason vocational w has a rather large place in our cu culum, and we try to make this struction as practical as possible. a part of it, the boys carry out act production and marketing projects their fathers' or other farms. Of these projects yield financial as

educational profits. One boy, example, made $800 in a year antaloupes. Another made a pro- f $400 on a registered cow, while ugh failure to dig and market his toes at the right time another boy $200.

We also give laboratory instruc- in agriculture. To accommodate demand for this and shop practice ecial building had to be erected. he shop work practical things, not kknacks, are made. Dozens of hog troughs, milk stools, wagon s, and wagon boxes now in use on wnee County farms are the work ur students. They have also re- ed machinery and tested milk for y farmers.

For the girls there is training in ing, sewing, and other household s which they may be expected to fter they leave school. Each year can a thousand or twelve hun- l jars of fruit. This is used in the ol cafeteria which they operate r the direction of the instructor ome economics. If they so desire, may also study stenography and e work."

erhaps the practical nature of the tional work at Seaman is no bet- illustrated than in the manage- t of the cafeteria. This supplies heons to from eighty-five to one dred persons each school day, at st of twelve cents a meal. Despite low price there is a profit of t $200 a year, which is used to hase supplies and equipment for school. One of the school's pianos esents the surplus from this ce for one year.

Naturally all our students will not armers," Mr. Seaman said. "Some hem will seek careers in the city, largely for their benefit we have blished a course in accounting. s by business and professional ers of Topeka supplement this se. Through a membership in ury, I also maintain some contact these men and their interests. these means the pupils not only a view of commercial life, but business men are made aware of existence and work of the school.

One day a banker, who had spoken he school and found out what it doing, asked me if I could recom- d some former student for a posi- in his office. It happened that I d. The young man made good, within a short time five of our ner pupils were employed in the e bank. Calls upon us from busi- concerns in search of help have e been of frequent occurrence.

While vocational work is stressed, ecognize the need for other train-

For the students intending to n to college, we offer a course de- ed to prepare for higher educa- . There is also a general course, courses for those wishing to ialize in normal training, home omics, and music. Though we not supply the exact educational ls of every pupil, we have tried to e the needs of the principal ips found in our community."

When the Seaman High School opened in the fall of 1920, seventy-six pupils and six teachers, including the principal, climbed the fire escape and crowded into one room of the uncompleted building. Within four years the enrollment tripled, and there has since been a steady growth. Instead of six, the school now has twelve teachers. Students are drawn from a radius of fifteen miles, and among the 236 pupils enrolled last year were thirty-five from other high school districts.

The foregoing facts indicate that Seaman High School is meeting a real educational need. Nevertheless its full service cannot be measured by the instruction given within its doors. Thanks to the vision and leadership of its principal, it reaches out and meets and serves the life about it at many points untouched by the ordinary school.

Because of the facilities at hand, as well as the willingness of the school to participate in community affairs, the building has become a social and recreational center. Many meetings of an educational nature and for entertainment are held there. The school's motion picture projector, a gift of the students, serves both to teach visual lessons and to bring an occasional evening of pleasure to the people of the neighborhood.

On Sundays the auditorium, which seats 600 people, is used for religious services. Before the school was built the community was short on church facilities. Now, through the addition of a parsonage, which stands near by, the people are enabled both to have a resident pastor and to attend church in their own community.

Though not under the direction of the high school, a very successful growers' market had its inception there. This market is at Seaman Corners, as the junction of the paved highways near the school is now known, and consists simply of a number of booths which are rented to farmers and truck growers for their use in selling produce direct to consumers who drive out from the city.

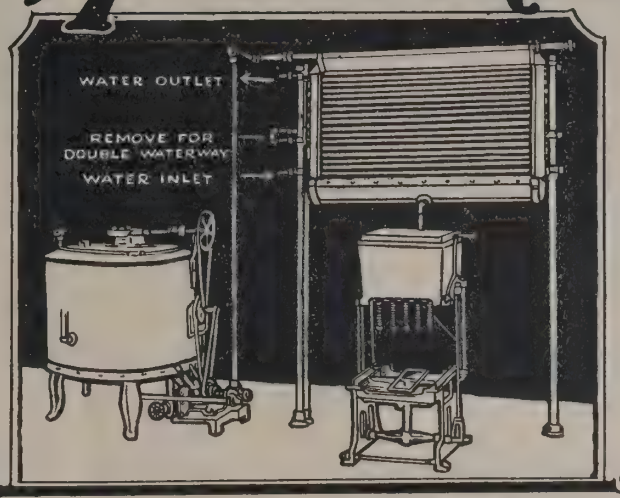
Each spring a community fair is held at the school. At the fair, programs of music and speaking combine with displays of agricultural products, live stock, school exhibits, and handwork to make a pleasant and profitable event. A night school for adults and employed young people, and a community newspaper are other means by which this high school has touched the life about it.

While serving useful ends in themselves, these various activities centering about the school have contributed to one larger and common end. This is the building of the Seaman community.

Before the Seaman High School was built, the district of which it is now the center possessed as little individuality as the average rural region. Without a common interest, the people were prone to be kept apart by petty jealousies, mistrust, and antipathy. They grouped largely along racial and family lines. Theirs was a community with the unity left out.

Now that rural high school, rising among these formerly dissociated elements, has bound them together and made unity where division existed. Out of fields and farms and people a new entity has been created. They call it the Seaman community now. As such it lives and breathes. It has a soul. Need the lessons of such an experience be pointed out?

SEAMAN HIGH SCHOOL



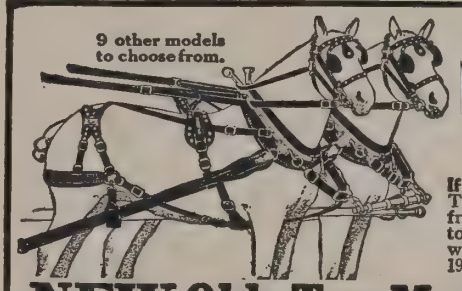
Proper Method

Blacksmith—"You say you can shoe a horse. How would you proceed about it?"

Applicant—"Toot my horn until the rascal got out of the way."

Cows require minerals which, with the exception of salt, are best supplied in rations having an abundance of legume hay like clover and alfalfa, rich in calcium, and a concentrate mixture including 20 per cent wheat bran, linseed meal, or cottonseed meal, rich in phosphorus. Cows should have free access to salt, which is relatively cheap.—G. C. HUMPHREY.

VICTOR DAIRY PASTEURIZER



for the FARM, DAIRY and SMALLER PLANTS

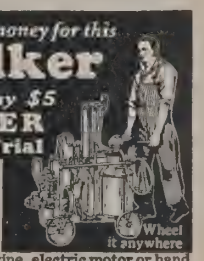
REALIZING the need for a simple, efficient and economical milk pasteurizing outfit for smaller plants and farm dairies, *CP* offers the Victor, illustrated above.

The outfit consists of a combined heater and holder, sanitary pump and Alaska cooler. (Bottle filler is not included, but can be supplied at extra cost.) Operation is simple and conforms with all state health boards' requirements.

With a Victor Outfit the small dairyman can produce good, wholesome pasteurized milk just as cheaply and efficiently as the big city dealer. Pasteurization provides safe milk and will increase your business. The Victor is a business builder. Write for full information and prices.

THE CREAMERY PACKAGE MFG. COMPANY
(World's Largest Dairy Supply House)
1245 W. Washington Blvd. CHICAGO, ILLINOIS
Sales Branches in Principal Cities

You Have From Now
Until 1928 to Pay!



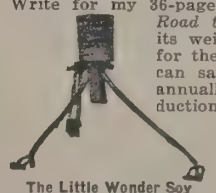
If you act quick, we will send you an Olde Tan Metal-to-Metal Harness on 30 days' free trial—without the slightest obligation to buy if not satisfied—and, then, if you want to keep it, you'll have from now until 1928 to pay for it! **But don't delay. Act now!**

NEW Olde Tan Models—NEW LOW Prices

Write today for our catalog showing new models at new low prices. Olde Tan is the famous harness with the "Buckleless Buckle" and Metal-to-Metal wherever there is wear and strain—making it the strongest, longest-lived, most economical harness to be had! Remember!—from now until 1928 to pay—in small monthly payments. **Write TODAY!**

BABSON BROS., 2843 West 19th Street, Dept. 28-53, CHICAGO

$5 *Send no money for this* **Milker**
Just pay $5 AFTER Free Trial
—then 8 mo. to pay



Yes sir, pay us nothing on this wonderful new type *portable* milker until AFTER thorough trial on **YOUR OWN cows.** Gas engine, electric motor or hand operated—your choice on free trial. So wonderfully simple! So easy to clean! So easy on the cows—and so easy for the dairyman to use! No pails, no pulsator, no pipelines. Yes, this milker **solves** the dairyman's problem. **And portable!** Just wheel it in and start milking! Now—right now (only in territories where we have no salesman or agent) free trial, **rockbottom price direct,** 8 months to pay. No money down—not a cent of installation expense. Try it and you'll **know** whether or not this is the milker for you.

EDITORIAL COMMENT

THE Board of Health of New York City has made a ruling that all butter sold within that city must contain at least 80 per cent fat and not more than 16 per cent moisture. We have looked upon this standard for butter as being fair and just to both producers and consumers. We have not been insistent that this double standard be adopted but we do insist that no butter appear on the market containing less than 80 per cent fat. It is well established that when butter contains more than 15 per cent moisture there begins a lowering of its quality. It seems to us this is reason enough not to incorporate much over 15 per cent of moisture in butter. There is no advantage to the producer, manufacturer, or dealer to incorporate more moisture than this or to have butter contain less than 80 per cent fat. We know the sooner we direct ourselves to the manufacture of dairy products by the right standards that quality will be improved and a greater income will be obtained for the producers of milk and cream.

FEWER COWS

The United States Department of Agriculture reports that we had on January 1, 1927, 21,824,000 dairy cows and heifers over two years old. This is 324,000 less than on January 1, 1926. It is the second year in succession that a decline in dairy cattle has been found.

We do not look upon this with any degree of alarm, but on the contrary consider it a splendid indication. The cow testing association, which to us is one of the strongest agencies in the development of profitable dairying, is to a large extent responsible for this. The facts are that our dairy cows are decreasing in number but there is a constant increase in milk production. Our dairy cows average to produce yearly about 160 lbs. fat. It is plain that if they averaged 250 lbs. that the number could be decreased by several million and we would still produce all the dairy products we need. If this were done, the profits from dairy cows would be increased many times, and the dairy farmer would be in much better financial circumstances.

Let the poor cow march to the butcher, for this is one of the ways to solve the dairyman's problem.

LAND VALUES

An incident was related to us recently which shows that the value of land does not depend wholly upon its richness in fertility. About 120 miles from New York City a farmer owned 135 acres of land and six years ago he mortgaged it. Each year he paid the interest and some on the principal until a year ago he had reduced the mortgage to $800. The banker who held this mortgage considered it good, and was surprised to be advised that the farmer had left the land and had turned the deed of the farm over to the bank.

This unusual situation caused the banker to investigate. He found six neighbors had abandoned their farms and were working in a factory some miles away. They received a wage of $7.00 a day for seven hours' work. This banker also found that no system of agriculture had been developed in this section that was profitable and these men who had abandoned their farms could make more in the factory and have more time to themselves than by operating their farms. The banker offered this 135 acres of fertile land, only a short distance from one of the greatest markets in the world, for sale and received the munificent sum of $250 for the farm.

This bank holds mortgages on land in several New England States and, becoming curious about their value, made an investigation in Maine. Here the bank found land selling for $200 an acre that was of no better quality than the farm in New York that sold for less than $2.00 per acre, but a diversified agriculture was being followed. These Maine farmers have made progress and have been unwilling to give away their farms for a job in the city.

It is a well known fact that dairy sections have not felt the pinch of the present depression in agriculture as much as other branches of farming. The cow not only brings them a constant income but she invariably causes the farmer to diversify. She is a great stabilizer of land values and is the most potent factor in establishing diversified agriculture.

IMPROVED METHODS

Many farm practices which were considered good twenty years ago are obsolete now, and the same can be said of practices in other industries. This has brought difficulties. No change is ever made without producing inconvenience and very often necessitates severe struggle before complete adjustment is made. We are such creatures of habit that when we become accustomed to doing a thing in a particular way it is difficult for us to change our method. In the first place, we do not desire to adopt new practices. We are all naturally lazy both mentally and physically, but since the world does not stand still we, of necessity, must change even though it produces pain and much weariness.

What are some of the things that have become obsolete in farm practices? We all agree that the cradle for cutting grain is no longer useful. Still, in our country, grain is being cut with a cradle and bound by hand. The farmer who follows this method of reaping cannot compete with the farmer who uses a self-binder or a combine which cuts and thrashes the grain in one operation. We still have the one horse and one man unit used for plowing and cultivating the fields. This combination cannot compete with the four-horse hitch or with a tractor capable of drawing at least three plows. A great many farmers still grow timothy hay which produces about one-tenth as much protein per acre and less than one-half as much total nutrients as alfalfa hay. These farmers cannot compete with those who grow legumes and neither can the man who owns cows averaging but 150 pounds of fat a year compete with the farmer whose herd averages 300 pounds of fat per cow per year.

There is no more reason to believe that the farmer with the cradle and the single horse hitch and who grows timothy hay and keeps the low producing cow can hope to compete with modern ways than to expect the local shoemaker who makes shoes by hand to compete with the manufacturer who makes them by machinery. Machinery is at the bottom of much of our agricultural trouble and we should recognize this and change our methods of farming accordingly.

ALFALFA FOR HUMAN FOOD

"Have you had your alfalfa today?" Who knows but what this may soon become a popular slogan for both man and beast!

Recently the daily press quoted Dr. Sherman L. Lewis, professor of chemistry at Indiana University, as telling the American Dental Association, "Human beings should display horse sense and eat horse food—alfalfa. Alfalfa is the richest of all leaf top vegetables in vitamins and iron.

"The American people should eat 15% more vegetables," he added, "and one of the greatest services a man might render the world today would be a recipe for an appetizing dish of bone marrow. Next to this would be the introduction of alfalfa as a common human food."

The merits of alfalfa as feed for dairy cows and other live stock have been loudly proclaimed and are well known. If it's good for cows why isn't it good for humans? Some years ago alfalfa candy was put on the market. Alfa Chocolates, they were called, and they are both delicious and nutritious.

We have a friend, hale and hearty at the age of 86, who eats linseed meal. Every day he sprinkles a spoonful or two on his cereal just like sugar. He claims that it is as good a condition for man as for cows. Is it any more unreasonal to presume that alfalfa would make a good fo for man? Our bodies need iron and other min als, vitamins, and protein, and all are found in falfa.

As for eating more vegetables, it is an esta lished fact that we should. Nutrition expe agree on this and have for years. It's a go thing to have this brought to our attention occ sionally though, lest we forget. Vegetables a an important part of the health diet advocated Dr. E. V. McCollum, one of the discoverers of v amins, who says, "The keynote to successful n trition is the proper selection and combination foods," and he suggests that proper selecti should include vegetables, dairy products, me fruit, and bread.

We live in a wonderful age. When you c turn a dial and hear voices and music coming tho sands of miles through the air it can almost said, "nothing is impossible." Some one may c vise a way of preparing a delicious alfalfa sal or perhaps we may be eating alfalfa as a cere on the breakfast table. Or, how about eating with vinegar as we do spinach?

How would you like your alfalfa today?

GOOD ROUGHAGE CHEAPLY GROWN

The importance of good roughage cheaply pr duced in the economy of producing butterfat forcefully illustrated in a feeding experiment co ducted at Huntley Experiment Farm in Montar

In this experiment, 7 cows were fed for a ye entirely on roughages consisting of alfalfa h corn silage, roots, beet pulp, and pasture. Th consumed on the average 7,112 lbs. of hay, 10,1 lbs. of silage, 2,186 lbs. of roots, 137 lbs. of be pulp, and were on pasture 130 days. These co averaged 12,454 lbs. of milk containing 453.7 l of butterfat.

These same cows were fed for a year on the roughages plus grain. They consumed on t average 9,179 lbs. of hay, 7,174 lbs. of sila 4,078 lbs. of roots, 5,558 lbs. of grain, 49 lbs. beet pulp, and were on pasture 95 days. They a eraged 16,366 lbs. of milk containing 558.7 lbs. butterfat.

If we charge these feeds against the butter production, the feed cost per pound is found to 21.6 cents for the roughage fed cows and 3 cents for the roughage-grain fed cows. Arbitra prices applied are: hay, $15 a ton; corn silage, $ roots, $4; grain, $30 a ton; beet pulp, $40 a t and pasture 10 cents a cow a day.

It is not wise to be hasty in conclusions wh only 7 cows have been fed for only a year un two methods of feeding. For example, the rou age-grain fed cows gained in weight which in cates they received more feed than could be us to produce milk. They were somewhat overf a factor that contributed to the higher cost p pound of fat. Further, it is not known whet these cows would stand up under such hea feeding year after year. They consumed an av age of 26,038 lbs. of feed plus 95 days past during the year.

On the other hand, it is not known whether t roughage-fed cows would continue to stand year after year on roughages alone and maint the production they made for one year. T fact that they lost weight indicates that for a ti in the lactation they did not get enough nutrients to supply their full needs.

To us the valuable lesson taught in this expe ment is the very good production that was ma on roughages alone. The roughages fed were the very best kind and the combination with p ture would be difficult to improve. It indica s that good roughages cheaply grown have an i portant bearing on the economy of milk prod tion. This brings us to our time worn but soun suggestion of feeding good roughages to the lim of appetite.

Hydrated Lime in Mineral Mixture

I wish to make the mineral mixture suggested in the Dairyman two months ago. Our dealers do not have lump lime or air slaked lime. All they have is "Limate," hydrated lime that masons now use instead of lump lime. Can I use this in place of air slaked lime?

Galesville, Wis. L. P. W.

Professor E. B. Hart of the Wisconsin College of Agriculture has given us the following reply to this inquiry:

"I do not know what 'Limate' is, but if it's used by masons, I should judge it was burned lime or calcium oxide. If it is, it is not suitable for animal feeding because it would heat up on contact with water. Your correspondent might determine whether it heats up on contact with water and, if it does not, then he could use it. Or he might throw some of it into a pile and let it air slake for a time; then it would be suitable to use provided there was no warming on suspension in water."

Herd Needs Cow Tester

We are milking 20 cows and feed them 850 lbs. of alfalfa hay daily and about 8 pounds to each cow of ground oats and barley with a little bran. These 20 cows give about 37 gallons of milk daily. It seems to us this is not nearly enough milk for the amount of feed the cows eat. What is wrong with our feeding? How shall we remedy the difficulty?

Williston, N. D. E. D.

If these cows are actually eating the quantity of feed indicated we are inclined to the opinion that they are now giving about all the milk that is possible to get out of them. A cow weighing 1,100 to 1,200 lbs., capable of making use of all the nutrients in the quantity of feed being fed, should produce at least 50 lbs. of 4 per cent milk daily. There are enough nutrients in the alfalfa alone for a cow of this size to make 30 lbs. of 4 per cent milk daily.

Alfalfa hay, ground oats, and barley and bran are not a bad ration. There is an excess of protein because of the excessive amount of alfalfa hay being fed, but if the hay is comparatively cheap one can sacrifice protein in a feed like alfalfa hay where there is little danger of injury because of the excess protein.

These cows average less than 2 gallons (16 lbs.) of milk a day. This being the average, there are some cows considerably below this. We are not advised of the stage of lactation. If nearly all the cows are quite near the close of their lactation periods the production could be justified because of this.

It is important to bear in mind that no amount of skill in feeding will cause a cow to give more milk than is governed by her inheritance. Her potential ability to produce is fixed by inheritance. How nearly she approaches the maximum of this ability is governed by feeding and by the factors of good cow management.

We think the remedy in this case, assuming the cows are healthy, is to use the milk scales and the Babcock test on each cow and eliminate every cow that cannot at least pay for her feed, some consideration being given to the stage of lactation of each cow. Continue to feed all the alfalfa hay the cows will clean up. Feed the concentrates mixture of ground oats, barley, and bran at a rate of 1 pound for each 3 lbs. of milk produced daily.

Fat in Holstein Milk Produces More Cheese

Take two cheese factories with identical conditions as to market and overhead. One factory receives 5,000 lbs. 4 per cent milk daily; the other receives 5,000 lbs. 3 per cent milk daily. Will both factories be able to pay the same price per pound for butterfat?

Clear Lake, Wisconsin. SUBSCRIBER.

One hundred pounds of 3 per cent milk will make on the average from 8.3 to 8.8 lbs. of cheese, while 100 lbs. of 4 per cent milk will produce about 10.6 lbs. of cheese. In other words, one pound of fat in 4 per cent milk will produce 2.65 lbs. cheese, and one pound of fat in 3 per cent milk will produce from 2.77 to 2.93 lbs. of cheese. With cheese at 25 cents a pound, this would make the pound of fat in 4 per cent milk worth 66.25 cents, and the pound of fat in 3 per cent milk worth from 69.25 to 73.25 cents.

The above figures indicate that although the higher testing milk produces more pounds of cheese per hundred pounds milk, yet because the solids not fat do not increase in the same proportion as the fat, the price per pound fat in milk will be lower for the high testing than for the low testing milk. Figured in another way, the 5,000 lbs. of 4 per cent milk would produce 530 lbs. of cheese, which at 25 cents a pound would amount to $132.50, and each patron would receive at the rate of 66.25 cents for each pound of fat delivered. The 5,000 lbs. of 3 per cent milk would make from 415 to 440 lbs. of cheese, which at 25 cents a pound would amount to from $103.75 to $110. As the 5,000 lbs. of 3 per cent milk would contain 150 lbs. of fat, these patrons would receive from 69.25 to 73.25 cents per pound of fat.

Bottles Check in Washing

I use a small room for sterilizing my bottles and milk utensils with live steam from a boiler. I have some trouble with the bottles checking with white specks in the glass especially around the bottom and top edges. I thought possibly some one else may have had the same trouble and had discovered a remedy.

Stevensville, Mont. M. D. F.

The proper washing and sterilizing of milk bottles is one of the large unsolved problems of the milk industry. A great deal has been written on this subject yet often some one raises a question that is not so easily answered. In your case bottles are checked with white specks in the glass especially around the bottom and top edges. To diagnose this case and locate the cause without seeing the patient is not so easy when one knows that there are so many factors that might play a part in producing these white specks.

First. The bottle itself may be at fault. The glass may contain small air pockets that open up when sterilizing heat is applied, yet, why should the specks appear more around the bottom and top edges? The damage may be done before the bottle reaches the sterilizer and not apparent until heat of high degree has been applied. If the damage has been done in the washing process, the construction of the bottle may be at fault. If the checking is at that point of the bottle surface that very largely comes in contact with other bottles in handling, the specks or checking is caused by the rather sharp edge left by the two halves of the mold in which the bottles were made. Such edges at the top and bottom of each bottle should not be left at the so-called high points of contact but should be underneath the bottom and over the top surface towards the cap seat. These sharp edges are capable of doing a great deal of damage, resulting in checks or scratches when bottles are placed in large numbers in the washing tank. These checks will not appear until the bottle is dry and taken from the sterilizer.

Second. There is a possibility that your water supply may have something to do with the checking or the formation of the white specks. Future investigation will tell us, "Know your water. See to it that it is properly softened; thus, the cost of washing will be greatly reduced and the resulting bottles will be clear and sparkling."

If your water is very hard, a slight deposit may remain on the bottles when placed in the sterilizer. When the heat is applied, the solid material carried by the bottles from the washing tank to the sterilizing rack may be lodged in the check or scratches as a white substance. Naturally, the bottles will have the appearance such as you find.

Third. Mention has already been made of the part that water plays in the washing of bottles and unless one knows the make-up of the water, not a great deal can be said about the cleansing material that is to be added. Ordinary laundry soaps are out of the question for many reasons. There are many standard washing powders on the market. The manufacturers of these cleansers should give you information as to what best to use when your water has not been softened before being placed in the washing tank. If the bottles are hand washed, one cannot use cleansing material that will attack the hands of the men doing the work. In many dairies ordinary sal-soda has given excellent results. In your case, if the make-up of the bottle is not the underlying cause, try the following experiment:

Wash a number of bottles by the usual method followed in your dairy and divide them into lots A and B. Wash a second lot using rain water, using some cleanser and divide into lots C and D. Place lots A and C in the sterilizer and do not permit the temperature in the sterilizer to exceed 160 degrees F. for not less than 20 minutes. Place lots B and D in the sterilizer and turn on steam as usual. When the four are taken from the sterilizer, examine carefully.

It would also be a good plan to make a similar comparison, using new and old bottles. Great care should be exercised in preventing scratching of bottles in handling. Thorough rinsing before placing bottles in the sterilizer is also required.

Wisconsin. C. E. LEE.

Private Versus Official Records

I should like to have your opinion of the comparative merits credence among breeders of dairy cattle and value in selling of production records by means of, first, daily weighing of milk and monthly fat test by the dairyman himself; second, cow testing association; third, Advanced Registry Official.

Mechanicsburg, Pa. E. H. H.

Private records are valuable to the owner of the cow but they will be considered with some distrust by those who do not know intimately the man who certifies to these records. They are primarily private herd records and have relatively small value in assisting in the sale of dairy cattle. They are probably of more value when the buyer actually visits the farm than where the attempt is made to sell by mail. They may assist a man's judgment very materially when he has an opportunity of seeing the cows himself.

The Advanced Registry test is generally held in most high esteem by breeders and by general purchasers of dairy cattle. It is made under well supervised conditions and all details have been carefully scrutinized by capable men. There is some criticism of these records because some have been dishonestly made, but we believe actual dishonesty is avoided almost entirely through the careful supervision that is given. There is, however, one criticism that is growing concerning Advanced Registry records and that is that they do not represent the actual productive ability of the cow. They are usually made under extreme conditions of feed and care, with the result that under normal herd management these cows will not produce anywhere near what they have been credited with under the Advanced Registry test. They also are likely to represent the cow under her highest peak of production.

Cow testing association records are coming into increasing respect in the minds of many breeders and purchasers of cattle. This is because a record is kept of the entire herd and not merely the exceptional animals in the herd. Under this system all the cows of a certain family are likely to have a record and this gives a better measure of the value of their breeding than merely to consider the record of an exceptional member of that family. Then, too, as a rule the cow testing records are made under more nearly normal conditions and it is fairly reasonable to expect that these cows given good care will produce equally as well in the new herd as in the old. This results in less disappointment. The disadvantage of these records is that they are not as carefully supervised and there is larger opportunity for error and for actual dishonesty. This has been overcome in part in some associations by the adoption of retest rules which provide that where a cow is making an exceptional record, the tester must stay at that farm the next day and keep her record for a complete 48 hours. This serves as a check upon early and late milking as also on other factors that might tend to increase the estimated production of the cow out of line with what her actual production might be.

Taken as a whole, we believe that in the sale of pure-bred cattle, the Advanced Registry record is probably still considered the most authoritative and most reliable. A good Advanced Registry test will probably be of larger sale value than will the other two forms of test referred to. We are not here speaking of what we believe should exist, but as to conditions as they do exist today.

We are inclined to the opinion that the day is not far distant when cow testing association records will be the primary record of production and it is possible they may eventually become the basis for a preferred registry in the pure-bred associations. There will doubtless be some development and some changes in methods of cow testing associations, but in general the present plan will be continued so that costs will not be unnecessarily increased. We believe at least that the testing of the entire herd as is now provided in cow testing association work is the sound and solid basis for breed improvement.

It is estimated by Professor Eckles that a cow test association record will be from 55 to 60 per cent of the record the same cow would make under the A. R. conditions. In other words, he would expect a cow making 300 lbs. of fat under ordinary conditions to produce 500 lbs. of fat under Advanced Registry conditions.

Subscription in United States and Mexico three years for $1.00; single year, thirty-five cents. Canada, three years, $2.50; one year, $1.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $1.00 a year; not in Postal Union $1.50 a year. These rates include postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers who farm with businesslike methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received thirteen days previous to the date of publication. Advertising to be classified or changes in advertising must reach us three weeks previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

President Coolidge Vetoes McNary-Haugen Bil

AS was expected, President Coolidge vetoed the McNary—Haugen Bill. It was generally known that he considered this measure unsound in principle and that if it became effective it would be injurious rather than beneficial to agriculture.

The President could have been less sincere with farmers and signed it under the pretext of giving it a trial and letting the Supreme Court assume the responsibility of informing farmers that it is in conflict with the constitution. He chose, instead, to give his reasons why the McNary—Haugen Bill is unsound and unworkable.

We regret we cannot give the full text of the President's veto message, for it completely exposes the fallacy of the measure as helpful to agriculture. We give below, however, such quotations from his message as we believe will give our readers a fairly comprehensive understanding of his message:

"No one can deny that the prices of many farm products have been out of line with the general price level for several years. No one could fail to want every proper step taken to assure to agriculture a just and secure place in our economic scheme.

"Reasonable and constructive legislation to that end would be thoroughly justified and would have the hearty support of all who have the interests of the nation at heart.

"For many years—indeed, from before the day of modern agricultural science — balanced and diversified farming has been regarded by thoughtful farmers and scientists as the safeguard of our agriculture.

"The bill under consideration throws this aside as of no consequence.

Bill Bestows Special Favors

"The measure discriminates definitely against products which make up what has been universally considered a program of safe farming. The bill upholds as ideals of American farming the men who grow cotton, corn, rice, swine, tobacco, or wheat, and nothing else.

"These are to be given special favors at the expense of the farmer who has toiled for years to build up a constructive farming enterprise to include a variety of crops and live stock that shall, so far as possible, be safe, and keep the soil, the farmer's chief asset, fertile and productive.

"So far as the farmers as a whole are concerned, this measure is not for them. It is for certain groups of farmers in certain sections of the country. Can it be thought that such legislation could have the sanction of the rank and file of the nation's farmers?

Government to Pay Losses

"This measure provides specifically for the payment by the federal board of all losses, costs, and charges of packers, millers, cotton spinners, or other processors who are operating under contract with the board. It contemplates that the packers may be commissioned by the government to buy hogs enough to create a near scarcity in this country, slaughter the hogs, sell the pork products abroad at a loss, and have their losses, costs, and charges made good out of the pockets of farm taxpayers.

"The millers would be similarly commissioned to operate in wheat or corn and have their losses, costs, and charges paid by farm taxpayers.

"It seems almost incredible that the producers of hogs, corn, wheat, rice, tobacco, and cotton should be offered a scheme of legislative relief in which the only persons who are guaranteed a profit are the exporters, packers, millers, cotton spinners, and other processors.

Federal Price Fixing

"Clearly this legislation involves governmental fixing of prices. It gives the proposed federal board almost unlimited authority to fix prices on the designated commodities.

"Nothing is more certain than that such price fixing would upset the normal exchange relationships existing in the open market and that it would finally have to be extended to cover a multitude of other goods and services. Government price fixing, once started, has alike no justice and no end. It is an economic folly from which this country has every right to be spared.

Denies It Would Help Farmer

"The chief objection to the bill is that it would not benefit the farmer. Whatever may be the temporary influence of arbitrary interference, no one can deny that in the long run prices will be governed by the law of supply and demand. To expect to increase prices and then to maintain them on a higher level by means of a plan which must of necessity increase production while decreasing consumption, is to fly in the face of an economic law as well established as any law of nature.

"Experience shows that high prices in any given year mean greater acreage the next year.

"Under the stimulus of high prices, the cotton acreage increased by 17,000,000 acres in the last five years.

Broad Powers of Board

"A board of twelve men are granted almost unlimited control of the agricultural industry, and can not only fix the price which the producers of five commodities shall receive for their goods, but can also fix the price which the consumers of the country shall pay for these commodities. The board is expected to obtain higher prices for the American farmer by removing the surplus from the home market and dumping it abroad at a below-cost price.

No Restraint on Price Boosting

"The law fixes no standards, imposes no restrictions, and requires no regulation of any kind. There could be no appeal from the arbitrary decision of these men who would be under constant pressure from their constituents to push prices as high as possible. To expect moderation under these circumstances is to disregard experience and credit human nature with qualities it does not possess.

Administrative Pitfalls

"The administrative difficulties involved are sufficient to wreck the plan. No matter how simple an economic conception may be, its application on a large scale in the modern world is attended by infinite complexities and difficulties. The principle underlying this bill, whether fallacious or not, is simple and easy to state; but no one has outlined in definite and detailed terms how the principle is to be carried out in practice. How can the board be expected to carry out after the enactment of the law what can not even be described prior to its passage?.

"Some conception of the magnitude of the task may be had when we consider that if the wheat, the corn, and cotton crops had been under operation in the year 1925, collection would have been required from an aggregate o 16,034,466,679 units. The burea states that it will be impossible to co lect the equalization fee in full.

No Curb on Production

"In trying to find a solution fo this fundamental problem of the sur plus, the present bill offers no cor structive suggestion. It seeks merel to increase the prices paid by the cor sumer, with the inevitable result o stimulating production on the part o the farmer and decreasing consump tion on the part of the public. It ig nores the fact that production i curbed only by decreased, not in creased, prices.

"In the end the equalization fe and the entire machinery provided b the bill under consideration wi merely aggravate conditions whic are the cause of the farmer's presen distress.

Guaranty to Packers

"With the limited number of farm co operatives with whom contracts ma be made for surplus disposal and th fact that farm co-operatives are no likely to be engaged in meat packing flour milling, or cotton spinning, i appears certain that the larger par of these contracts must be made be tween the board and the processor and other agencies.

"In actual working this is a com plete guaranty of the profits of thes concerns without restraint or limita tion on profiteering against Amer can consumers, of which the farme himself is a very large element. I is not a guaranty to the farmer. Th implications of this were pointed ou in significant remarks in the minorit report of the house committee on ag riculture.

"The proponents of the bill at th hearings conceded that it could no operate as to animals except under contract with the packers.

Burden But No Benefits

"The bill would impose the burde of its support to a large degree upo farmers who would not benefit by it The products embraced in the pla are only about one-third of the tota American farm production.

"There are several million farmer who do not produce any of the des ignated products, or very little o them, and they must pay the prem ums upon the products designated i the bill. In some commodities, suc as corn and mill feed, the farmer are practically the sole consumer It is proposed to increase the pric of corn and mill feed to America farmers, and therefore the costs t the dairy and cattle feeding indus tries whose products are omitte from the bill.

"Beyond this, it means that b dumping the American feeds abroa at lower prices than those charge under this plan to the America swine, cattle, and dairy farmer, w should be directly subsidizing foreig production of pork, dairy, beef, an other animal products in competitio with our own farmers in the market of the world. We shall send chea cotton abroad and sell high cotton a home.

Peril of Increasing Surpluses

"The effect of this plan will b continuously to stimulate America production and to pile up increasin surpluses beyond the world demand We are already overproducing.

"It is said that by the automati increase of the equalization fee t meet the increasing losses on en larged dumping of increasing surplu that there would be restraint on pro duction. This can prove effective or

after so great an increase in production as will greatly enlarge our exports on all the commodities except cotton.

"Several of our foreign markets have agriculture of their own to protect and they have laws in force which may be applied to dumping and we may expect reprisals from them against dumping agricultural products which will even more diminish our foreign markets.

Would Build Up Bureaucracy

"The bill means an enormous building up of government bureaucracy to fit and inspect the billions of dollars of contracts with all their infinite variety of terms covering different goods and their different grades and qualities. In turn, all of the contracts of resales by these institutions must be examined and checked to determine the losses made.

"Parallel with it another bureaucracy must be built up to collect and distribute the equalization fee. It all adds for an aggregation of bureaucracy dominating the fortunes of American farmers, intruding into their affairs and offering infinite opportunities to fraud and incapacity. It does not replace any middlemen or manufacturers; it means that thousands of officials are set to watch them and the farmers to see that they do not evade the requirements.

Adds to Cost Spread

"One of our difficulties today is the great spread between the farmer and the consumer. All these increased processors' profits and this cost of bureaucracy must simply add to this spread without bringing to the farmer any return on such items. In fact, as he is a large consumer, he also pays this.

"There is no reason why other industries—copper, coal, lumber, textiles, and others—in every occasional difficulty should not receive the same treatment by the government. Such actions would establish bureaucracy on such a scale as to dominate not only the economic life, but the moral, social, and political future of our people.

"The suggestion often made that the scheme should be tried, and if it fails be repealed, loses all force. This suggestion is faulty in another respect—namely: that failure would be demonstrated only by the accumulation of a huge surplus in storage. The discontinuance of operations while a vast supply remained in storage would result in a prolonged depression of price through the surplus being fed into the markets or through fear of its sale.

Majority Escape Fee

"It is no answer to say that the farm producers would induce their advisory council and the members of the board from their land-bank districts to exclude corn from the operation of this bill, because the people who do not pay an equalization fee and on whom the burden does not fall are 80 to 85 per cent of the producers of the corn.

"It may be contended that since there is to be an equalization fee on swine that the feeders would be taxed, but the swine and corn are separate units and have a separate stabilization fund and under the law the fees on swine cannot be turned over to the stabilization fund for corn.

Reversal of Policy

"The main policy of this bill is an entire reversal of what has been heretofore thought to be sound. Instead of undertaking to secure a method of orderly marketing, which will dispose of products at a profit, it proposes to dispose of them at a loss. It runs counter to the principle of conservation, which would require us to produce only what can be done at a profit, not to waste our soil and resources producing what is to be sold at a loss to us for the benefit of the foreign consumer."

Attorney General Condemns Bill

According to Attorney General Sargent, the McNary—Haugen Bill is in conflict with the constitution in the following respects:

Because it would limit the President in the selecting members of the farm board, requiring that he name men recommended by a nominating committee.

Because it would delegate price-fixing authority to the board without laying down any rule under which the prices shall be determined.

Because the fixing of prices itself never has been found by the courts to be within the powers of federal government.

Because it compels citizens to contribute, through the equalization fee, to a certain process from which they may or may not profit, amounting to the taking of property without due process of law.

Admits There Is Farm Problem

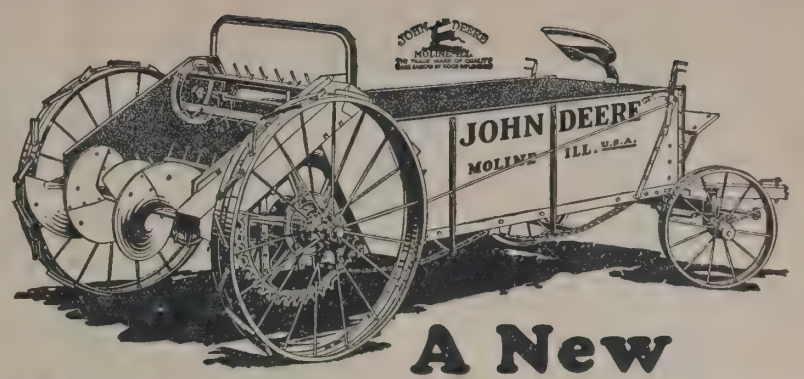
"That there is a real and vital agricultural problem is keenly appreciated by all informed men. The evidence is all too convincing that agriculture has not been receiving its fair share of the national income since the war. Farmers and business men directly dependent upon agriculture have suffered, and in many cases still suffer from conditions beyond their control. They are entitled to and will have every consideration at the hands of the government.

"Surely a real farm relief measure must be just and impartial and open the way to aid for all farmers. Surely it must not contemplate, as this measure inescapably does, that farmers in some regions should be penalized for the benefit of those in other regions. Surely it must be aimed to promote the welfare of the community at large.

Denies Unanimous Support

"What the farmers want, and what the Amercian people as a whole will approve, is legislation which will not substitute the governmental bureaucracy for individual and co-operative initiative, but will facilitate the constructive efforts of the farmers themselves in their own self governed organizations.

Regrets He Can Not Approve Bill



"It is a great regret to me that I am unable to come to the conclusion that the bill would help agriculture, be of benefit to the country, and be in accord with the constitution.

"Other plans have been proposed in congress for advancement in this recovery, which plans offer promise of sound assistance to the farmers without these unconstitutionalities, invasions of executive authority, this contracting with packers and flour millers and other manufacturers, this overproduction with its inflation and inevitable crash, without this indirect price fixing, buying and selling, this creation of huge bureaucracies.

"They are, on the contrary, devoted entirely to the principle of building up of farmer-controlled marketing concerns to handle their problem, including occasional surplus production, and applicable to agriculture and not to a minor fraction. I have frequently urged such legislation. I wish again to renew my recommendation that some such plan be adopted."

Salesman—"Yes, sir, in this car you'll feel as comfortable as if you were at home."

Mr. Henry Peck (promptly)—"Er—have you no other kind?"

A New John Deere Spreader

Now you can get a tight-bottom New John Deere Spreader with the same distinctive features that have made the John Deere the leading endless-apron spreader.

This new spreader with **the beater on the axle** and **the box roll turn** gives you the four essentials in a spreader that are really important: **It saves work in loading; it is easier pulling; it does better work; it lasts longer.**

Its lower box saves from 15 to 25 per cent of the labor in loading. The energy required to load 100 loads of manure into the ordinary spreader will load from 115 to 125 loads onto the New John Deere.

Its higher drive wheels and fewer moving parts, combined with draft-reducing roller bearings, save your horses. Many farmers who always have used three and four horses on ordinary spreaders, use only two on the New John Deere.

Better work follows the low-down beaters. Manure is not thrown high in the air. A wide, even blanket of manure is spread beyond the drive wheels before winds can cause drifting and unsatisfactory spreading.

For years to come the New John Deere will give you profit-making, labor-saving service. It is built to the John Deere high standard of quality.

See it at your John Deere dealer's—compare it with others. You are sure to want its exclusive advantages.

FREE—A Real Treatise on Fertilizers

SOIL FERTILIZERS, a booklet worth dollars to you. Tells all about the value and use of barnyard manure and other fertilizers. This booklet, also folder describing the New John Deere Spreader, free. Write John Deere, Moline, Illinois, and ask for Booklets S-714.

The First Silo in Americ

ALTHOUGH Dr. Manly Meyers erected two experimental silos in 1875, it remained for Francis Morris of Maryland in 1876 to build the first silo to be used as a storage for winter feed for a herd. By 1878 he is reported to have fed a thousand head of cattle on corn silage as their winter ration.

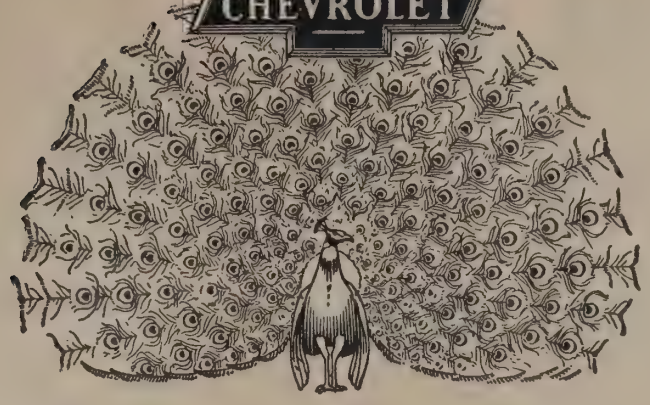
"I made use of Indian corn as winter feed as long ago as 1876," wrote Mr. Morris in 1880. "I cut it into short pieces about three-quarters of an inch long and put it in silos prepared for it. The advantage of this crop is so great that it must change the agriculture of every corn-growing country. Cattle and sheep will be raised on every farm to an extent heretofore not thought of. Bury your feed in silos, and when winter comes feed your stock upon it, and when you have tried it once you will never allow yourselves to be without it. I have used it four seasons, every time with complete success, and I know it has multiplied the value of our land three or fourfold. It will require one ton a month for each cow, and all animals will thrive and do well on it."

"Thirty years ago," says a writer in the Country Gentleman of July, 1880, "I visited Europe. Being in the neighborhood of a French agricultural school, I had the curiosity to visit the farm. One of the first things I saw was a silo of beet leaves that was opened to give the fodder to some working oxen. It was in May, and the leaves had been put down the previous fall. The leaves came out a brownish color, with a peculiar but agreeable smell, and as they were forked over to the cattle, they were eaten with evident relish. The practice is nothing new, only of late it has become a 'boom.'"

Writing in 1880 Mr. O. B. Potter of New York says, "I have practiced the system of silage for three years. He was probably the first New York man to build a silo. The same year J. J. B. Brown of New York repo "Mr. Mills of New Jersey, Mr. Pot of New York, and Mr. Bailey Massachusetts all unite in their te mony as to the success of this exp ment. Mr. Goffart, of France, long ago as 1876, received the d oration of honor for the preservat of maize as green fodder by ensila which is today a solved probl thanks to his persevering and succe ful experiment."

The first publication on silage issued by the U. S. Department Agriculture in 1876, upon read which Mr. Levi Gilbert of Wisco dug and filled a trench silo with c the following year. The first ab ground silo in Wisconsin was built stone and grout in 1880 by Dr. L. Weeks of Oconomowoc and he imm diately became a strong advocate silage. The same year Mr. J Steele of Waukesha County used of his root cellar for a silo and so well pleased with it that he bui silo the next year that saw conti ous service until as late as 1921.

G. R. Frampton in his opening dress at a meeting of the Califo Dairy Council, outlined the hist and growth of California dairyi "California dairying is 230 years this year," said Frampton, "for was in 1697 that Father Kino, a Je it Priest, brought into California first cattle for breeding purpo Early laws forbade the killing cows, and the cattle belonging to missionaries multiplied rapidly. day California's milch cows al number 603,000. Scientific meth and the importation of pure-b stock have combined to make Cali nia renowned throughout the cou for its marvelous herds. Last y California cows produced an aver of 220 lbs. of fat per cow and c tributed $126,000,000 to the econ ic life of the state."



BESS JOHANNA ORMSBY, AN UNUSUAL COW

BESS is a 12-year-old daughter of the Holstein bull, Sir Pietertje Ormsby Mercedes, and has just completed her fourth 7-day record above 32 lbs. of butterfat (40 lbs. butter). In addition to these four short time records and three others that are very good ones, she has six long time records as follows: 17,801 lbs. milk, 705.8 lbs. butterfat in 365 days as a 2-year-old; 21,380 lbs. milk, 834.9 lbs. butterfat in 305 days, as a 4-year-old; 21,518 lbs. milk, 829.54 lbs. fat in 305 days as a 5-year-old; 19,791 lbs. milk, 802.34 lbs. fat in 305 days at 6 years; 30,143 lbs. milk, 1,198.09 lbs. butterfat in 365 days as an 8-year-old; and 17,023 lbs. milk, 774.79 lbs. fat in 305 days at 9½ years. During her 305-day records she carried calf from 193 days to 233 days of the record periods.

Bess Johanna Ormsby was bred by E. C. Schroeder, Minnesota and is owned by Winterthur Farms of Delaware. She has dropped ten calves.

CHEVROLET

The Most

Beautiful Chevrolet

in Chevrolet History!

a host of improvements

Not only does this most beautiful of all low-priced cars offer new paneled and beaded Fisher bodies but also many new fine car features and mechanical refinements such as:

Full-Crown Fenders

New full-crown one-piece fenders add a note of smartness to the new and supremely beautiful bodies.

Bullet-type Lamps

Modish new bullet-type head and cowl lamps add a pleasing touch of beauty and style.

AC Oil Filter

A new AC oil filter removes all dirt from the oil supply—assuring greater oil mileage and a minimum of motor wear.

AC Air Cleaner

A new AC air cleaner safeguards motor parts from excessive wear by removing all dust and grit from air passing through carburetor and into the engine.

New Tire Carrier

A new tire carrier of improved design is mounted on the frame—entirely free from the body.

New Door Handles

New remote control door handles—handily located in center of doors—provide a beauty and convenience feature new to low-price field.

Better Ignition

but no *increase* in "Z" engine *prices*

The ever-reliable "Z" Engine has been made better than ever by the high tension rotary magneto illustrated above. This magneto—built by Fairbanks-Morse and fully guaranteed—assures a fat, hot spark and makes easy starting a reality. It is a magneto that is self-oiling, dust-proof and waterproof—the only rotary high tension magneto ever installed as standard equipment on an engine of this type. It has been proved in use on 65,000 "Z" Engines.

Under ordinary conditions this type of magneto would be too costly for installation on a small engine. But by manufacturing our own magneto on a volume production basis we are able to equip the "Z" Engine with this magneto at *no increase in price.*

Remember that this is only one outstanding feature of many in an engine that would still be second to none even if not so equipped!

Why Not Grow Some Wheat Instead of All Oats?

E. J. DELWICHE, Wisconsin Experiment Station

WISCONSIN, at the present time, is not a wheat country. It is not the purpose of this article to make it one. That is, we certainly do not want to go back to the days when wheat was grown year in and year out without any rotation. That kind of a system of farming with wheat, or with oats, corn, or potatoes, cannot last. All crops, including wheat, should be grown in rotation and in Wisconsin, in the main, with the purpose of feeding the bulk of them to our flocks and herds. It is said that the feed bill which the Wisconsin farmer pays for purchased feeds on which he has to pay the freight and at least one dealer's profit is something tremendous, that it amounts to something like $40,000,000 annually.

Good feeding implies a range of feeds, for this is not only necessary to balance up the ration but to furnish a variety as well. Recent experimental tests in the state and elsewhere have shown that greater attention should be paid to the mineral content of the feeds that we supply to our live stock. Feeds that are low in lime or low in phosphorus are likely to bring disastrous results if fed exclusively. Bran, for years and years, has been a mainstay in making up rations for dairy cattle. Its high protein content and relatively high percentages of lime and phosphorus make it a feed that is hard to beat. Bran prices in recent years, however, have been and continue now to be somewhat prohibitive. Because bran has been selling from $28 to $35 per ton, farmers in recent years have not fed this feed to any great extent, the reason being that they cannot quite see how to pay the feed bill and still have a profit. Now, then, what can be done in the matter? The answer to this is that the farmer can, at the present time, grow his own bran; at least he can grow wheat which will make a good substitute, either ground up whole and mixed with oats, barley, or corn, or to be fed after the flour has been extracted and used at home, or sold on the market. Probably, under present conditions in the state, for some time the wheat grown will be fed by mixing as mentioned above.

In 1911 a new strain of wheat was originated that changes the spring wheat growing situation very materially. Reports we have on file give yields for fields ranging in size from five to ten acres of from 25 to 40 bushels per acre. Please bear in mind that such yields of wheat correspond with yields of oats of from 50 to 80 bushels. Were these reports for one year only, not much significance could be attached to them. This new wheat which was named Progress, because of its being a decided advance over other varieties grown in the state, is strongly resistant to rust. That explains the fact that it yields well year in and year out. It is subject to fluctuations in yield, just as oats or barley are, but chiefly due to a lack of moisture or a lack of fertility, not because of its being subject to rust. Rust has been the chief cause why Wisconsin wheat yields have remained low. Progress wheat has proven to be at least 50 per cent more resistant to rust than such varieties as Marquis, Fife, Bluestem, or Durum. It is also a high protein wheat and in this respect being somewhat superior to Marquis. That makes it a very fine feed, indeed.

Progress wheat which was first disseminated from the northern branch stations where it originated, is now grown quite extensively in several Wisconsin counties, both north and south. We now have wheat areas where this variety is grown in Douglas, Bayfield, and Ashland Counties in the north; in Door, Brown, Kewaunee, and Manitowoc Counties in the eastern section of the state; in Marathon and Wood Counties in the central section; in St. Croix, Polk, and Burnett in the western section, and in Winnebago, Fond du Lac, Jefferson, and Grant Counties in the southern section. Thus, farmers wishing to grow wheat need not send any great distance to secure seed stock. The names of farmers and seedsmen who have seed of this variety to sell can be obtained by sending to the experiment station for a list.

Wheat and oats make a very good mixture from the standpoint of grain produced, both in quantity and quality. This Progress wheat is stiff-strawed, not at all subject to lodging and for this reason, alone, we believe that it is desirable to grow as a mixture with oats. Farmers in the western section of the state who follow this practice report some very good results. We suggest sowing one bushel of wheat to one or one and one-half bushels of oats per acre. Progress wheat ripens about as soon as our early varieties of oats. It can be sown, however, with later varieties as it is not subject to shattering and can stand for a few days after ripening until such oats as Ped. No. 1 or even Swedish Select are ready to cut. It makes a good combination to mix with such oats as Forward for the northern and northeastern sections of the state, with No. 1 in all sections and with Wis. No. 7 (Kherson) in the more southerly localities.

Whether Wisconsin will some time in the future come back as a large producer of wheat and to the extent of selling wheat on the market, is not so sure at the present time. That the farmers who are working go grades of loam and clay soils miss opportunity by not growing spri wheats, seems plain to the writ There is no question at all but th the home-grown wheat kernel can made to supply the needed phosph us in our dairy rations. In view the fact that we now have a spri wheat that can be grown successf ly with very little loss from the fects of stem rust, it seems that t culture of this valuable crop sho be increased. For the immedi present at least, we shall probal want to limit the growing of wh for live stock, and principally as f for dairy cattle. The future will t whether Wisconsin farmers some will become self-sufficient to the tent of growing wheat to supply th own tables.

Silo Filling Easy

HOARD'S DAIRYMAN:—We wo suggest to Emet H. Hobson that if wants to find an easy way to fil silo, adjust the blower so that the lage drops into the middle of the s He can then send the men hunt gophers, if he has nothing else them to do. Unless the goats wanted for flavoring purposes, he feed them on tin cans, fly nets,

For the past two years we h filled our two 16-foot silos with having anybody in the silo. One m in the silo is a nuisance, and two worse, and we would not board best man for that work.

Filling silos is one of the eas jobs on our farm. The engine dr the filler which cuts up the corn the field, and in heavy corn a loa ready to be taken to the silo in 1 15 minutes. A crew of five men boys and three teams is large enou to do this work. I know of one c where two farmers with the help their wives filled two large silos.

Wisconsin. HENRY A. OCHNSE

"ONE OF THE BEST THRESHING FLOORS IN AMERICA"

At least it was so-called about the year 1750 by its owner, John Beale Bordele lawyer and planter of Maryland. The illustration is from a pictorial history of th United States issued by the Yale University Press under the title, "The Pageant America." Five of the proposed fifteen volumes have been issued.

Kansas Students Hold Dairy Show

HOARD'S DAIRYMAN:—Members of the student Dairy Club at the Kansas State Agricultural College decided several weeks ago that they wished to start an annual fitting and showing contest of dairy cattle. The result of their decision and united efforts was the Agg-K-ies Dairy Show held February 9 at Manhattan. The date selected was especially appropriate in that many cattle breeders and

Dick Stumbo holding B. M's Bangora Melrose with which he won sweepstakes award in the recent fitting and showing contest at the Kansas State Agricultural College.

other visitors were present for Farm and Home Week at the College.

This first Agg-K-ies Dairy Show was decidedly successful. Only eleven days previous to the final showing 52 contestants drew animals of the college dairy herd by lot and started the work of fitting, yet when these same contestants lined up their entries for the judges' final approval it was almost necessary to consult registration papers to identify some of the original entries. The improvement was decidedly beyond the judge's expectations and the crowd of spectators voiced their approval of the contestants' intensive efforts by frequent applause.

For convenience in showing, the entries were grouped into twelve classes, three of each of the four major dairy breeds. The winners of the breed classes competed for champion showman of the breed and the four breed champion showmen came back for sweepstake honors and a silver cup offered by a local creamery and the Dairy Club. Many other small breed and cash prizes were awarded in addition to ribbons. The awards were based 50 per cent on improvement in condition and 50 per cent on showmanship.

Dick Stumbo, showing the French cup winner, B. M's Bangora Melrose, was champion showman of Ayrshires and later received the sweepstakes award over all other contestants. Stumbo is a Sophomore in college and claims Iola as his home town. George Carls, a short course student, was a close contender for high honors having previously been acclaimed champion Holstein showman with a splendidly fitted two-year-old heifer. A granddaughter of the late Fern's Vexford Noble helped Hugh Richwine to win premier honors in the Jersey classification, while Fred Schultis showed a Guernsey cow to the final award in that breed.

Judges for the contest were Clem Young, well known Holstein breeder; L. W. Linn, extension dairyman; and Professor H. W. Cave of the dairy department.

Kansas. R. H. LUSH.

Wisconsin Holstein Meeting

This year for the first time the Holstein-Friesian Association of Wisconsin made of their annual meeting a two-day affair and a very satisfactory meeting it proved to be. The attendance was good,—33 counties of the state were represented,—the program was both entertaining and instructive, and a majority of the breeders who came not only stayed both days, but seemed to enjoy themselves all the time they were there.

The meeting was held Feb. 15—16 at Oconomowoc, Wis., with the Waukesha Co. breeders acting as hosts.

At the business meeting, following the reports of the officers, there was quite a discussion of the public sale question with the final result that the president was instructed to appoint a committee to study the question and to formulate public sale policies which are to be later presented to the association for adoption.

A plan of selective registration for bulls based on the Canadian system was endorsed and a resolution was passed favoring an increase in the tariff on cheese.

The breeders voted unanimously to invite the National Association to Milwaukee for its 1928 meeting.

John D. Jones, Jr., S. H. Bird, Chas. Vander Schaaf, and Ellsworth McKinney were elected directors. The officers elected for 1927 are F. J. Southcott, president; Chas. Vander Schaaf, vice-president; Jno. Wuethrich, treasurer; and L. L. Oldham, secretary.

Food for Newlyweds

The bride and the goom were visiting in San Francisco. They stopped at a restaurant where a flip young waitress served them.

"Would you care for some honeymoon salad?" she asked.

"What is it?" asked the confused groom.

"Just lettuce alone," replied the waitress.

Get these facts firmly in mind

THIS IS WHAT ENGINEERING LEADERSHIP MEANS TO THE LIGHT CAR BUYER

The *Whippet* is the only light car nationally equipped with 4-wheel brakes.

The *Whippet* is the most economical car on the market.

The *Whippet* has all the speed you will ever want.

The *Whippet* has more leg-room than any other light car.

The *Whippet* is the smartest appearing light car.

The *Whippet* has established a new National Economy Record, averaging 43.28 miles per gallon in a 3,559 mile coast-to-coast trip.

The *Whippet* has standard tread with ample road clearance.

Now at these remarkable reduced prices, the Whippet is more than ever the leader in light car value.

If Your Dealer Does Not Handle Goods Advertised in Hoard's Dairyman— Ask Him Why!

You'll find Kelly quality in both these tires

THE regular Kelly-Springfield tire is built now, as it always has been, for the man who is satisfied with nothing short of the best the market affords.

For those who do not need the extra durability of the regular Kelly product, but who do want to get real value in a lower priced tire, Kelly builds the Buckeye, a sturdy, full-ply, full-size tire that compares favorably with many other tires offered at higher prices.

Whether you want the very best, or whether you simply want good honest tires at a modest price, you can purchase any tire marked "Made by Kelly-Springfield" with the fullest confidence that your money can't buy anything better.

The regular Kelly tire costs no more than any of the well-known makes. The Buckeye costs less. You can't go wrong on either.

"Kelly dealers everywhere—there must be one in your town."

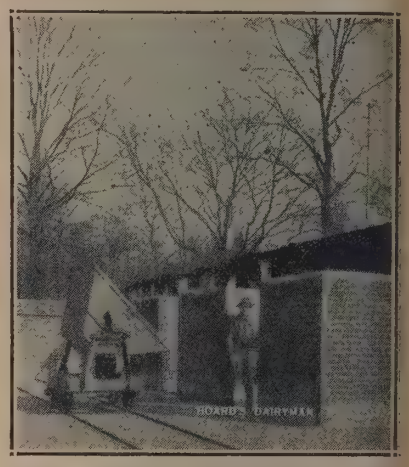
Foot and Mouth Disease Commission Gives Results

THE highly infectious nature of foot and mouth disease virus, the extremely small size of its active agent, and its ability to escape identification as to its true nature are the outstanding results of the year's study by the American commission which went to Europe in 1925 to study foot and mouth disease and is now preparing its official report.

The commission comprises Dr. Harry W. Schoening of the United States Bureau of Animal Industry, Dr. Jacob Traum of the University of California, and Dr. Peter K. Olitsky of the Rockefeller Institute for Medical Research. By a special act of Congress the commission was empowered to conduct studies of foot and mouth disease abroad with the hope of obtaining information to be used in suppressing most effectively any outbreaks of the malady that may occur in the United States. The dangers of experimenting with the foot and mouth disease virus in the United States were considered too great to permit studies in this country. On the other hand, officials in European countries where the disease is constantly present welcomed the investigations of the American commission and gave assistance.

Virus Extremely Active



Though highly technical, the findings of the commission show briefly that the virus of foot and mouth disease is extremely active and dangerous. It produced the disease experimentally when diluted as much as one part in ten million. The organism is too small to be seen by the most powerful microscopes. As further proof of its minuteness, the investigators found that centrifugal force for two hours at from 2,500 to 3,000 revolutions per minute failed to throw the organism out of solution.

The resistance of foot and mouth disease virus to strong antiseptics also proved to be surprisingly great. Whereas 60 per cent alcohol kills ordinary bacteria within a minute it failed to destroy the virus of foot and mouth disease in 26 hours. The virus also showed abnormal resistance to other antiseptics, such as acetone, bichloride of mercury, and cresol.

Reporting that "foot and mouth disease is one of the most contagious diseases known," the commission further notes that in hay or in garden soil it remained living for at least 25 days and the infective agent may persist for longer periods under favorable conditions for its protection.

The commission's work included studies of immunity and the susceptibility of many kinds of experimental animals. The causative agent of foot and mouth disease appears to be separate from any of the known kinds of bacteria of the ordinary species and has baffled artificial cultivation by any means now available. The commission's attempts to produce an active artificial immunity against foot and mouth disease were unsuccessful.

Highly technical studies showed that the electric charge of the virus is positive and that the electric charge influenced the passage of the virus through certain types of filter materials. This group of studies, though showing the active agent of the virus to be extremely small, indicated that it is not of a fluid character.

EXPERIMENTAL PENS BUILT FOR INVESTIGATIONS OF FOOT AND MOUTH DISEASE AT ALFORT, FRANCE

The carrier shown is used for removal of manure. Other containers are used for feed and necessary supplies.

Carriers of the Disease

In cattle studies, active virus was found in the saliva before any lesions of the disease were observed. Other workers also have reported the ability of animals in the fever stage to infect others before external signs are seen. The earthworm could not be implicated as a carrier.

In many respects the virus of foot and mouth disease was found to resemble that of vesicular stomatitis and both produced similar signs in guinea pigs, cattle, and swine. Horses, however, are resistant to foot and mouth disease but are susceptible to vesicular stomatitis. Hence, the horse can be regarded as the best test animal on which to make a diagnosis when either disease is suspected.

The American commission performed most of its work at Strasbourg, France, where Dr. Louis Boez of the Institut d'Hygiene, acted as collaborator. Other studies were made at Alfort, France, with the valuable assistance of Professor Vallee. These and other officials supplied experimental animals and aided the American scientists in studying the most promising methods and results of European investigators as a basis for the commission's experiments. In addition to experimental work the commission made special studies of the extent of the disease and methods of control in a number of the countries of Europe. Countries visited were:

FOOT AND MOUTH DISEASE INVESTIGATORS AT STRASBOURG, FRANCE

Left to right: Dr. Louis Boez, French collaborator; and the American commission: Dr. Peter K. Olitsky, Dr. Harry W. Schoening, and Dr. Jacob Traum.

France, Germany, England, Denmark, Sweden, Holland, Belgium, Switzerland, Italy, Austria, and Hungary.

Slaughter Method Most Effective

A close scrutiny of methods used in Europe for controlling foot and mouth disease by rigid quarantines showed that even the severest form of quarantine is relatively ineffective compared with the prompt slaughter of diseased and exposed animals, as practiced in the United States. European officials with whom the American scientists discussed methods of combating foot and mouth disease agreed that, when its extent is limited to a small percentage of the animals, the slaughter and clean-up method is the only effective one, besides being the most economical.—U. S. Dept. of Agriculture.

English Costs of Producing Grade A Milk

Producers of clean milk in England are having a hard time to convince consumers that the prices being paid are not enough to cover the extra costs of producing such milk, according to a new 60-page book by V. Liversage of the Agricultural Research Department of Oxford University. The data included in the discussion, while of English origin, may be of some interest to producers of good milk in the United States. The purpose of the author, however, is in defense of producers and directed to the consideration of consumers. In so many words the author says that if consumers demand good milk either they will have to pay more money for it or producers will have lower production costs.

The book sells for 70 cents a copy and may be secured from Hoard's Dairyman Book Department.

Equity Women's Auxiliary

We feel more publicity should be given to the work of the Women's Auxiliary to the American Society of Equity, Co-op., as it is of vital importance to all farmers. Their slogan is, "Profitable Prices for Farm Products," which means better living conditions and happier homes, better clothes, recreation, music, and good books for the members of the home.

Our aim is that *all* farm families shall enjoy the same privileges. We ask no favors other than other workers do, through finding cost of production on farm products, based upon an eight-hour day, the same as other industries, and that the farmer's dollar now having only 83c purchasing value may have the same value in buying power that other business has. Our agricultural colleges should work along this line of finding cost of production. To this end we urge organization and co-operation—more direct co-operation between the farmer and consumer—in this way making both their dollars go further by saving the middleman's profit. Also, by co-operative buying in large quantities of staple products used on the farm, such as coal, flour, feed, salt, etc., farmers can buy more cheaply, thereby again making their dollar reach further.

Unity and co-operation should begin in the home of every American family, for there rests the foundation of our nation, for "the farmer feeds them all."

We feel our Women's Auxiliary is doing a worthy work and more auxiliaries should be organized. Every local A. S. of E. should have one in connection, for they are a power and strength for good by standing behind their husbands in their efforts to organize. They help to make the local meetings interesting by taking care of the social end—arranging programs, serving lunches and doing all in their power to help make farm life broader, richer, and happier and more worth while in their respective communities, as well as trying to benefit all agriculture nationally.

Wisconsin. (MRS.) F. MEVILLE.

Too Much Protein

I intend to feed to Guernsey cows a grain mixture composed of 400 lbs. of corn and cob meal, 200 lbs. each of ground oats and barley, 200 lbs. each of cottonseed meal and gluten feed. This mixture is to be fed with good alfalfa hay. Will it make a properly balanced ration?

Sparland, Ill. C. L. M.

The grain mixture contains more protein than is necessary when fed with alfalfa hay as the only roughage. A mixture containing not over 10 per cent of digestible protein supplies plenty of this nutrient. Such a mixture may be made of 400 lbs. of corn and cob meal, 200 lbs. each of ground oats and barley, and 50 lbs. each of cottonseed meal and gluten feed. In fact if liberal amounts of the alfalfa hay are consumed, 20 to 25 lbs. per head daily, a mixture of equal parts of corn and cob meal, ground oats, and barley will supply enough protein to properly balance the ration.

Flax With Small Grain

HOARD'S DAIRYMAN:—Tests with flax and small grain seed together show that in Canada, as well as in some states in the Northwest, it is possible to get larger yields of grain than from small grain alone. But such results can not be expected everywhere, as three years of testing in Ohio indicate. The table gives results of the tests which were started in 1923.

The varieties of barley and oats used in this test are the ones that have given the highest yield in variety tests at the Station. Fulghum oats and Oderbrucker barley ripen at about the same time and, therefore, are ideal varieties for growing together. Marquis spring wheat is used because seed of this variety is readily available on the market and is likely to be the one that Ohio farmers would secure. The flax used is Linota, a high seed-yielding variety from North Dakota.

In this test, oats outyielded barley, and spring wheat yielded much lower than either oats or barley. This is in agreement with previous tests on the station farm at Wooster and on nine outlying test farms in the state. Oats alone produced more grain, more digestible crude protein, and more total digestible nutrients than any other crop grown singly or in combination. The yields of grain were in the following order: oats, oats and flax, oats and barley, barley and flax, barley, barley and spring wheat, spring wheat, spring wheat and flax, spring wheat and oats, flax.

The yields of total digestible nutrients in order were oats, oats and flax, barley and flax, oats and barley, barley, spring wheat, barley and spring wheat, flax, wheat and flax, wheat and oats.

Although three years may not be long enough on which to base conclusions, the indications are that a high yielding variety of oats will give a larger return to the acre under Ohio conditions than any mixture of cereals and flax.

New Jersey. E. A. KIRKPATRICK.

THE FULLER
AUXILIARY TRANSMISSION
FOR FORD TRUCKS

ADDS SELECTIVE GEAR RANGE TO PLANETARY CONVENIENCE

THE Ford Truck planetary transmission and the FULLER form an ideal combination that has all the planetary's virtues, plus the big features of sliding gear control.

Equipped with this unit your truck will have the flexibility of four speeds forward and two reverse. It will have abundant pulling ability. Transmission bands will last several times as long. Yet your truck will retain the easy sure control, the rapid change of speeds, the quick acting reverse, and the efficient service brake that make the planetary so well adapted to farm work.

The FULLER gives you a speed for every road condition. You have the regular Ford high for level stretches—an intermediate for plowed fields or ordinary hills—the regular Ford low for steeper hills, and a double low for deep sand, mud holes, and heavy grades.

This unit also gives you 80% more pulling ability, enough to take 4,000 pound loads without overstraining your truck.

The FULLER is speeding the work and cutting costs on many farms. Yet it is designed so simply that it sells for only $60, a price well balanced with the original cost of the Ford Truck.

Order one through your Ford dealer.

FULLER FEATURES

Four Speeds Forward—Two Reverse.
No Neutral Position (Ford Brakes Always Available.)
No Added Strain on Motor, Universal Joint, or Drive Shaft.
No Rebuilding Necessary; No Cutting of Drive Shaft.
Installation, 2 to 3 Hours; No Special Tools Needed.
Very Simple and Easy to Operate.
Built by Fuller; Largest Manufacturer of Truck and Bus Transmissions in the World.
Fully Guaranteed for 90 Days Against All Defects.
Price—$60, F. O. B. factory.

PRICE $60.00 F. O. B. FACTORY
$5.00 Additional West of the Rockies

NATCO SILOS

Good for Many Years of Dependable Silo-Filling

When you invest in an ensilage cutter, get one that *will stay with you for years*—and that will stay on the job without shut-downs or trouble, season after season.

The Rowell Trojan Ensilage Cutter has been designed and built to give that kind of satisfaction—many years of trouble-free, dependable silo-filling! Its twist-proof steel main frame; guaranteed-for-life flywheel which carries the knives; smooth-running; long-wearing Hyatt roller bearings; end-thrust bearings that take up play; perfect timing of feeder, cutter and blower (the Trojan *feeds*, as it *cuts*, as it *blows*)—no overloading or clogging of any part—these, and other good features make the Rowell Trojan the leader among silo fillers.

Cull Beans Good Feed

HOARD'S DAIRYMAN:—In your January 25th issue, you published an editorial in which you stated that cull beans were not commonly fed to cows, and their value was doubtful. Perhaps it is so in Wisconsin, but in Michigan the supply of cull beans during the past two seasons has been so abundant that they are being fed in considerable quantities to dairy cows. At first they were fed ground, but, being unpalatable and causing scours in a number of cases, they were not fed to any extent. Cooking, however, removes both these objections.

At present ten of the twenty-five members in the Potterville Association of Michigan are feeding cooked beans. They show good results, both in more economical production and, in most cases, increased production. For instance, here are two herds where cooked beans were added to the grain ration. Silage was fed for roughage, with alfalfa hay in one case and timothy hay in the other.

The first herd, during December, had a feed cost of milk per cwt. of $.98, and an average of 943 lbs. milk for cows in milk. In January the feed cost of milk was $.75, and the average production was 1,184 lbs. milk for cows in milk. The second herd of 10 cows had the milk cost reduced from $1.20 to $.99, and the average production of milk was increased from 760 lbs. to 801 lbs. milk for cows in milk.

So we may conclude that beans, when cooked, are worth more than half as much as cottonseed meal or linseed oil meal as a source of protein. R. D. PARTRIDGE, Tester.

Mixing Feed

HOARD'S DAIRYMAN:—When I took over the work of the South Newaygo Association of Michigan a year ago most of the members were feeding corn and oats, supplemented in some cases with cottonseed meal, some with oil meal, and many with nothing at all. Several were feeding a commercial 24 per cent feed straight and some as a supplement to corn and oats.

As soon as advisable I tried to get the members to mix up a home mixture that would compare favorably with commercial mixtures. There are several advantages in this. First, it is a saving of labor and time to feed a cow a given number of pounds of one grain mixture rather than dishing out several different kinds of grain. Second, every cow in the herd gets the same kind of a mixture, that is the same per cent of protein, etc., whereas they would not if fed separately of the various feeds under ordinary farm conditions. Third, the feed may be made up of a greater variety than would otherwise be practical, thus also making for palatability.

Many of the members are feeding a ration made up of corn meal, ground oats, bran, cottonseed, oil meal, and gluten feed in different proportions according to their individual needs and prevailing condi

*Includes dry cows. †Retest rules followed.

tons, such as corn and oats available, sage available or not, kind of rough-ge available, etc. This ration can be ade up from 10 to 30 cents per ndred pounds cheaper to supple-ent corn and oats, and is 40 to 70 nts cheaper than feeding the com-ercial feed straight. This mixed ed seems to give equally as satis-factory results as any other feed. nce the members get used to feed-g it, they would much rather mix is home mixture than feed the sev-al feeds separately.

CLARENCE PRENTICE, Tester.

Write the C. T. A. Editor, Hoard's Dairyman, for our prize offer to testers for monthly and annual reports.

The Cows Were Prepared

HOARD'S DAIRYMAN:—There was unusual increase in production ring January for cows in the Eleva Cleghorn Association of Wisconsin. many of the new herds the in-ease was better than 25 per cent on e same cows that were milking the nth before. This was largely due better feeding.

Among the old herds, those that re producing butterfat at a feed st of over 40 cents per pound during e winter months a year ago, are now oducing it for 28 to 30 cents. This chiefly because these herds are in tter condition now than they were year ago. Last summer these herds re fed grain while on pasture.

Every herd is being fed a balanced tion according to butterfat produc-n this winter. Continuous culling d good management are also play-g a large part in this improvement er a year ago.

Every cow, including dry ones, is ured in our association averages cause this is the only true average yway. Herd averages including ly certain cows of these herds that ppen to be milking then are not ry reliable when one is comparing ords and herd feed costs.

JOHN J. TAYLOR, Tester.

Cows as a Market for Feeds

HOARD'S DAIRYMAN:—The dairy-n does not like to buy feed at one ce and pay $2.50 per bag for it en he can buy the same just across street for $2.00. For this very son there have been 105 cows led from the Hamilton County ennessee) Cow Testing Association ich finished its first year's work cember 31, 1926.

The average yearly production of association per cow year was 12 lbs. milk and 249.1 lbs. fat, while average of the cows sold was 27 lbs. milk and 174.1 lbs. fat.

This happens to be an association ere whole milk is sold, so we will eak in terms of whole milk. As ted, the cows sold produced 1,685 . milk less than the average of the sociation which, if valued at 30 its per gallon, the prevailing price, uld mean that these cows would ng in $58.80 less than the average w.

The milk produced by these cows led cost the dairymen 26 per cent re in feed cost than did that pro-duced by the cows kept. In other words, when the cows kept were given enough feed to produce 100 lbs. milk, they produced 100 lbs.; but when the same amount of feed was fed to the cows culled, they produced only 78 lbs. instead of 100 lbs.

C. R. HART, Tester.

"Compare it with the finest cars of Europe and America —and you will discover that the only difference is one of wheel-base and price" . . .

$1095

Of all the changes which have occurred in the automotive industry during recent years, none is of greater significance than the trend of public opinion toward the Oakland Six. *Each year more buyers have seen that no other car of comparable price provided such masterly engineering, such scrupulously fine construction and such superlative performance results!*

That the Greater Oakland Six is the Oakland triumph of all, is clearly revealed by the spectacular popularity it has enjoyed from the day of its introduction. It offered such valued features as commandingly beautiful bodies by Fisher, the widely imitated Harmonic Balancer, four-wheel brakes, air cleaner, oil filter. It introduced the now famous Rubber-Silenced Chassis and foot controlled tilting beam head-lights. *And it took all America by storm!*

If you know the many benefits and advantages attached to the ownership of a truly fine car—come in and see the Greater Oakland Six. Compare it with the finest cars of Europe and America—and you will discover that the only difference is one of wheel-base *—and price!*

OAKLAND MOTOR CAR COMPANY,
PONTIAC, MICHIGAN

LICENSING FACTORY OPERATORS

J. W. WHEATON, ONTARIO

DURING the manufacturing season of 1926, cheesemakers in Ontario, Canada, were on trial. This was undertaken with a view to testing the qualifications of makers for certificates under the licensing plan which comes into effect this year.

Among others there were four main tests which decided the fate of makers so far as licensing and receiving certificates are concerned. These may be defined as follows:

1. How his cheese grades.
2. The kind of milk he accepts.
3. Sanitary conditions of factory and equipment.
4. Makers' appearance or, if you will, his own sanitary condition and that of his assistants.

The first one is important and at the same time clear and definite. With cheese grading in force the quality of the produce each maker turns out can be accurately ascertained and this quite independently of those who have the granting of licenses under their control. Cheese grading comes under the jurisdiction of the Dominion Department of Agriculture, whereas the licensing of makers will be a provincial matter. All that is necessary for the provincial authorities to do is to obtain from Ottawa the exact grading of each maker's cheese and award the certificate accordingly.

The Milk Supply

The second test is linked up closely with the first. In fact the two cannot be separated very well. How a maker's cheese grades depends in no small degree upon the kind or quality of milk he accepts for cheese making. This responsibility he must take upon himself. If he accepts milk that he knows will not make first grade cheese, the onus is upon himself. A maker's ability to make first class cheese is dependent in a large measure upon his ability to judge the quality of the milk he receives.

Sanitary Condition and Cleanliness

The sanitary condition in which the factory and its equipment is kept is a definite and clear-cut test. Whether a factory is kept in a cleanly and sanitary manner or not there can be no two opinions. It is either kept clean or it is not kept clean. Any well informed and experienced instructor or inspector should be able to size this up pretty accurately.

They are judged upon the sanitary and cleanly condition in which they keep the factory and equipment and not upon the factory itself or its equipment. There are today old, worn-out buildings with inferior equipment kept scrupulously clean and in first class sanitary condition in so far as it is possible for the maker to do so under such circumstances. On the other hand, there are new, up-to-date factories with proper equipment kept in anything but a cleanly or sanitary condition. It all depends upon the man.

The Maker's Appearance

The maker who keeps his factory and its equipment in a cleanly condition will keep himself and his person in a cleanly condition also; and, likewise, those who work with him. This may not hold true in all cases but it will in at least nine out of ten cases. As a rule, however, the maker, clean and tidy in appearance at all times, will have clean and tidy surroundings where he works and the tools he works with will correspond. And the rule works the other way, too. A slovenly, untidy maker whose everyday wearing apparel is greasy and filthy will have his factory and its equipment in the same state of untidiness and lack of cleanliness.

Cheesemaker's Certificate

A first class certificate may be granted to a cheesemaker who has in the previous year manufactured 93 per cent or over of first grade cheese; who keeps himself and his assistants clean and tidy, his factory and its surroundings in a clean, tidy, sanitary condition; who can properly operate the Babcock Test; and who holds a Dairy School Diploma, or in lieu thereof has had experience of two years or more as maker in a cheese factory prior to 1927.

A second class certificate may be granted to a cheesemaker who has in the previous year manufactured not less than 88 per cent first grade cheese, and who keeps himself and his assistants clean and tidy, and his factory and its surroundings in a clean, tidy, sanitary condition.

Two important provisions in the regulation governing certificates are as follows:

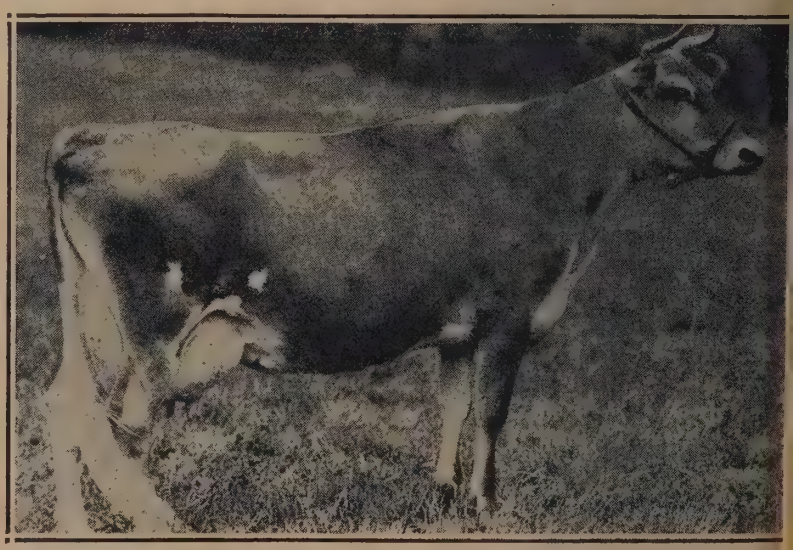
The holder of a certificate who knowingly accepts milk that is tainted, partly sour, or delivered in rusty or unclean cans may have his certificate cancelled or suspended on the recommendation of the Director of Dairying.

The holder of a certificate who accepts milk which has been rejected by any other holder of a certificate for being tainted, partly sour, or delivered in rusty or unclean cans, or who knowingly within ten days accepts milk or cream from a patron whose milk has been so rejected, may have his certificate cancelled or suspended on the recommendation of the Director of Dairying.

Buttermakers' Certificates

A first class certificate may be granted to a buttermaker who has in the previous year manufactured 95 per cent of his butter in a first workmanship manner—who grad supervised the grading of cream isfactorily—who keeps himself his assistants clean and tidy an creamery and its surroundings clean, tidy, sanitary condition, can properly operate the Babcock and who holds a Dairy School D ma, or in lieu thereof has had ex ence of two years or more as mak a creamery prior to 1927.

A second class certificate ma granted to a buttermaker who h the previous year manufacture per cent of his butter in a first workmanlike manner, who grad supervised the grading of cream isfactorily, who keeps himself his assistants clean and tidy an creamery and its surroundings clean, tidy, sanitary condition, who can properly operate the Bab test.



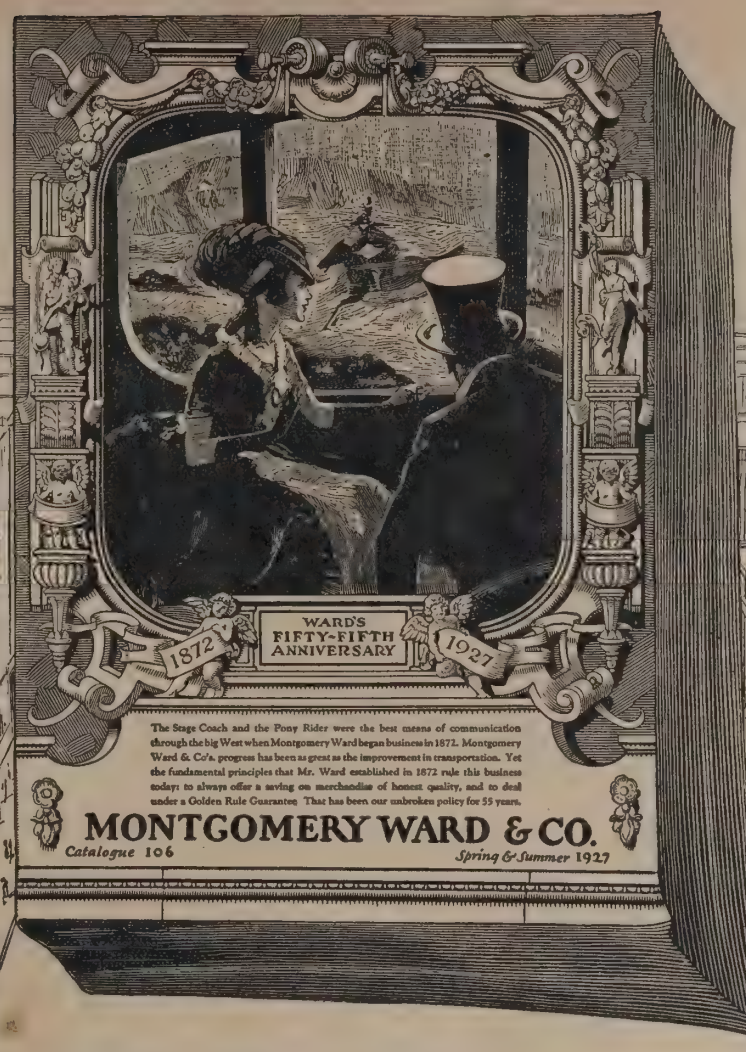
One provision in the regulati worth noting here and it is this:

A holder of a certificate who k ingly accepts cream which has previously placed in its proper g by any other holder of a certi may have his certificate cancelle suspended on the recommendatio the Director of Dairying.

Provision is made for the gra of permits to makers unable to q fy for a certificate but who, i opinion of the Director of Dair has had sufficient experience training to act as a temporary m Permits will not be issued to any son for more than a total of two endar years.

The licensing plan, of co means that no person can act as er in any cheese factory or crea unless he holds a certificate o granted a temporary permit to able him to qualify.

Water in abundance, not c than that from a deep well, is as essary for milk production as is —G. C. HUMPHREY.



NEW YORK JERSEY, SOPHIE'S EMILY, IS PHENOMENAL PRODUCER

IF all the milk which the New York cow, Sophie's Emily, produce on official test in seven years was placed in quart bottles set en on end, these bottles would reach a height of 7⅛ miles. In h seven successive tests Emily has produced 110,193 lbs. or 51,252 quar of milk and 5,424 lbs. of butterfat. This gives her an average of 7 lbs. of butterfat and 15,742 lbs. of milk for the seven years. In h latest test, which is her highest, she yielded 838.93 lbs. of fat a 17,393 lbs. of milk in 365 days.

This superb Jersey cow is owned and was tested by W. R. Kena Jr., of New York. Emily is a daughter of the Gold and Silver Med bull, Pogis 99th of Hood Farm, and a granddaughter of Sophie 19th Hood Farm, the world's champion for lifetime production.—T American Jersey Cattle Club.

Ball-Bearing

Ball-Bearing

McCormick-Deering
(PRIMROSE)
The Ball-Bearing Machine

THIS is the wonderful machine that set the pace in modernizing the cream separator. From farm to farm went the good word about the new efficiency that eased the daily work and added to the daily cream saving. The demand for the *ball-bearing* machine—McCORMICK-DEERING—grew by leaps and bounds. Thousands upon thousands invested in the simpler, easier-turning, cleaner-skimming separator. Today these thousands are better friends than ever of the durable ball-bearing machine.

The best test of success and popularity is the testimony of owners. When you buy a cream separator, ask the men and women who use McCormick-Deering day in and day out. Satisfy yourself about every point—*cream saving, cleaning, turning, sanitation, lubrication, simplicity, durability,* and *service.* Go by what they say about the ball-bearing machine.

Made by the Harvester Company. Sold everywhere by the McCormick-Deering dealers. You will profit by investing in a McCormick-Deering Cream Separator.

INTERNATIONAL HARVESTER COMPANY
606 So. Michigan Ave. of America (Incorporated) Chicago, Illinois

"If—for *any* reason, the valve chamber on this Milker should be damaged, or get out of order, we will repair or replace it free of charge, *during the life of the machine.*"

What THIS Guarantee Means

19 years ago, the first Hinman Milker carried the above guarantee.

From that day to this, *no Hinman owner has ever had to buy a new valve to replace the original one.*

THIS GUARANTEE MEANS

1. That from the start, the Hinman idea has been to sell *dependable, day-after-day machine milking*—not just a machine.
2. That the Hinman Valve, so simple it hasn't even a spring, *has* to be reliable or we couldn't afford to make that guarantee.
3. That of the two moving parts on the Hinman (aside from power) the only one that needs factory attention to adjust it, is protected by free service *as long as you operate a Hinman Milker.*

Think what that guarantee means! And then get *all* the facts. Find the other reasons why the Hinman is today "the milker most dairymen use."

Send for the Hinman Catalog. Write today.

CLAY

New Side Wall Window
Galvanized Steel Sash and Frame

Designed for masonry, hollow tile and wood walls, absolutely tight, frame is mortar filled and becomes solid part of wall. Lasts a life time and is absolutely fireproof. Will never swell and stick. Will never warp, shrink or dry out. Heavy ribbed glass is not easily broken and will throw the light all over the barn. Tilted, permits ample winter ventilation over top without direct draft on animals. For summer—tilted and also raised allows greater air volume than any other window.

Seasonable Live Stock Notes

IN this issue is a story of what dairymen in a Wisconsin County think of sweet clover for cow pasture after they have given it a trial. It should make many dairymen think about cow feed for this fall and next spring. The only dairymen who are going to have good sweet clover pasture next spring are the ones who put seed in the soil within the next six or seven weeks. It does not take long to make up one's mind to seed sweet clover but it does take some time to get some good seed, find out if lime is needed, and get the lime hauled in case it is needed. The most important seasonable live stock note we can think of for our March 10 issue is sweet clover for cow pasture.

Alfalfa for Cow Hay

To be consistent with what has been said about sweet clover for cow pasture we are reminded that alfalfa for cow hay is a timely topic. Spring seeding prevails in the northern states and signs of spring and the calendar tell us spring is just around the corner. Experience and observation tell us that one does not feed home grown alfalfa hay until the crop is grown and harvested. Likewise one does not grow a crop unless it has its beginning months in advance of the time it is needed. We know of no better way to make money from cows in 1928 than to seed some alfalfa in the spring of 1927, and that time has just about arrived.

Teaching Colts to Work

Many a green colt is now learning how to apply its power to a load. The common term used to designate this new experience for beginners is "breaking" but we prefer to think of it as "teaching" or "training" the awkward, untried, inexperienced, potential brain and power of the animal so that it will not only understand what is to be done but also how best to do it. To do this nothing is better than to hitch the green colt with a steady, dependable, patient horse that seems to understand the ignorance of youth well enough to know what to do to help the colt find itself. We have seen such horses that, at times, demonstrated better headwork than their drivers. If one has such a horse give the green colt the advantage of its training ability.

Care of The Feet

We have seen a good many bad feet in mature horses that could have been, at least, partially prevented had sufficient care been given at the right time when, as colts, they were getting ready to earn a place in the barn in front of half a set of harness. These yearlings and two-year-olds have been roughing it all winter over frozen ground and jagged ice. Their feet should be inspected at this time—before they go on pasture. Smooth the feet up with a rasp and help them to develop properly, for as the Scotchman says "no feet and legs, no horse," so is it true.

Water Must Be Hot

The McLean system of preventing parasites and certain diseases in pigs has its many advantages and it has some disadvantages. One of these has to do with the requirement of scalding the floors and partitions of the farrowing pens with boiling water in which lye has been placed, one pound to thirty gallons. The boiling water is necessary to kill the eggs of worm parasites and that is specifically why it is used so hot. It is an advantage in results obtained but somewhat of a disadvantage in its application. It is a weak place in the system because in many instances the water applied will not be hot enough. We caution farmers to apply water that is just as near the boiling point as possible when it is actually applied.

To Warm Chilled Pigs

Keeping newborn pigs dry and warm is an essential part of swine husbandry. To do this it is sometimes necessary to resort to artificial means. One of the best ways we know of is to line a large basket with burlap, place a jug of hot water in the center, and around this enough burlap to keep the pigs from being burned. Place the pigs in the basket around the jug. Heated bricks covered with burlap are also good for this purpose.

Sunshine for the Calves

Of all the live stock on farms during the winter months, dairy calves probably receive less direct sunshine than cows, pigs, or even poultry. We are inclined to the opinion that the lack of direct sunshine for extended periods during the winter is partly responsible for some of the ills and unthriftiness sometimes found among dairy calves. The sunshine is better now, there is more of it, and it is more penetrating. We believe it worth while to make some kind of arrangement to give these calves the advantage of at least two hours of midday sunshine every day it is available. We believe it will help them to ove

It Pays to Produce Clean Milk!

PRODUCING *clean milk* is a matter of *good business* as well as *good health.* Any milk—whether it's Certified, Inspected, Grade "A", or just plain milk, must be low in bacteria count, to find a ready market.

For this reason farmers and dairymen producing Certified, Inspected and Grade "A" Milk, do their milking with *Universal Milking Machines.*

Not only does the Universal Milker produce *cleaner milk* than can possibly be obtained by even the most careful hand milking, but it also cuts milking time and labor in half—and then some! Write for free catalog that tells all about this better way of milking.

THE UNIVERSAL MILKING MACHINE CO.

come some of the effects of influences accompanying winter housing.

Keep The Hen's Feet Dry

There is a great temptation at this time of year or even earlier to turn the hens out of their winter quarters. This has its advantages and then again there may be disadvantages. There can be no harm in turning hens out on a nice warm day if the snow is gone and the ground fairly dry. The trouble comes when one fails to keep them in when a typical March snow storm comes along. The production of a flock may be checked quite a little under these conditions. If one keeps a hen's feet dry and warm and gives her the proper feed she will fill the egg basket—that is if she has the right kind of ancestors.

Rats Hard on Baby Chicks

A boyhood experience prompts us to suggest that a good insurance policy for baby chicks is to be purchased with an effective rat poison or any other method that will protect baby chicks from this hazard. Before the time of incubators and brooders, mother hatched our chicks with hens and brooded them in little home-made coops that were not always rat-proof. One morning there was a lively call from the chicken yard and the men of the farm assembled. Mother had found that where one coop contained 2 hens and 33 chicks the night before nothing remained in the morning but the hens. Mother was angry. Armed with spades we proceeded to investigate a nearby pile of rails. It was nearly dinner time before we got the marauder and then we were not certain we had the right one, but mother felt better anyway. Get the rats before they get the chicks.

Dry Skimmilk For Calves

Raising calves by the "minimum milk method with dry skimmilk" makes it possible to improve the dairy herd without seriously curtailing the monthly milk check.

There is no substitute for milk in raising good milk producers. Its high cost in territories where whole milk is sold has forced many dairymen to resort to purchased cows to replenish their herds. This practice does not permit a control of the herd quality but tends to lower the quality of the herd.

Now that dry skimmilk (powder or flake) is increasingly available for calf raising, a dairyman can raise his own calves and gradually improve the production of the cows in his herd. Remixed skimmilk costs about half as much as whole milk.

According to experiment station records, normal growth was produced for calves consuming 70 to 80 pounds of dry skimmilk and 150 pounds of whole milk.

Detailed feeding practice using the minimum milk method with dry skimmilk is contained in this issue of "Better Calves," Bulletin 301 of the American Dry Milk Institute. By this method, whole milk is fed during two weeks, then replaced gradually—a pound a day—by remixed skimmilk until the whole milk has been entirely replaced by the remixed skimmilk at the age of three weeks. A recommended grain mixture and hay are fed beginning at two weeks of age.

At six or seven weeks the calf should be doing well, and the remixed skimmilk may be gradually reduced until at two months the calf is getting only hay and a grain mixture containing dry skimmilk.

Three successful grain mixtures are given in the bulletin which also has a convenient mixing table for dry skimmilk, a table of normal weights for calves, and a helpful set of general rules for calf raising.

These rules, given below, are worth the attention of every calf raiser:

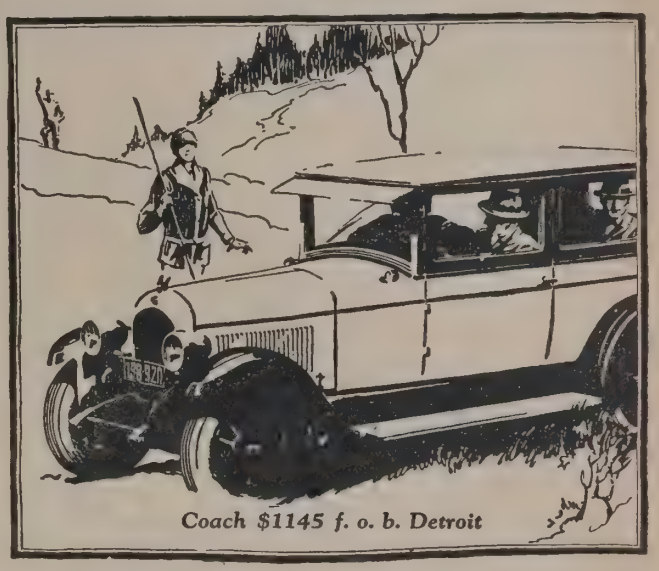
1. The price of success is cleanliness, regularity, common sense.
2. Calves differ in appetite, amount required, and ability to stand changes.
3. Rules are only a starting point. The feeder must see the calf, see if it is "off feed," if it "scours," if it "grows," and change the rules if necessary.
4. Never overfeed.
5. Always weigh the feed. A spring balance in daily use is a most profitable investment on a dairy farm.
6. Clean feed box every day.
7. Supply fresh, clean drinking water.
8. Calves do better in separate pens, or at least stanchioned or tied at time of feeding milk and grain.
9. Watch the condition of the calf's bowels. If scouring, reduce the milk to one-fourth and give a dose of castor oil. Work the calf back gradually to full feed.
10. Cold milk, irregular feeding time, unclean pails are common causes of sick calves and underdeveloped calves.
11. Remixed skimmilk will sour just like fresh skimmilk if allowed to stand around. Mix fresh; feed warm (98°). Scald pails daily.
12. Dry skimmilk does not sour. It will keep for long periods in tight containers. Keep it covered.
13. Transportation and storage of dry skimmilk are both cheap and convenient.
14. Dry skimmilk is the 9 pounds of food left after 91 pounds of water have been removed by heat from 100 pounds of fresh, sweet skimmilk. When remixed, the calf cannot tell the difference.

A copy of Bulletin 301 may be had without cost from the American Dry Milk Institute, 160 North LaSalle Street, Chicago.—H. E. VAN NORMAN, President American Dry Milk Institute.

Officer of the Law: "Here, you must accompany me."

Drunken Banjoist: "A'right. What chu wanna shing?"

PUBLIC *preference chooses the inimitable Chrysler "60"*



ONE of the most convincing proofs of Chrysler "60" superiority is trying to match its features in any other six of its type and price.

7-Bearing crankshaft;
Impulse neutralizer;
Oil-filter;
Air-cleaner;
4-Wheel hydraulic brakes;
Full pressure lubrication;
Manifold heat control;
Levelizers front and rear—

These, with many other features that cannot be imitated, have been embodied in the Chrysler "60" ever since its introduction.

These typical features of the Chrysler "60" were harmonized into the car's original engineering design—*and are thus uniquely Chrysler*—insuring that flashing speed of 60 miles and more per hour, enviable acceleration of 5 to 25 miles in 7¾ seconds, with the almost magical handling and operating ease that are typical of every Chrysler, and endure throughout its long life.

It is for this fundamental reason that the Chrysler "60" has been accorded a public preference that has contributed substantially

Coach $1145 f. o. b. Detroit

to Chrysler's dramatic rise from 27th to 4th place.

Chrysler "60" prices—Touring Car, $1075; Club Coupe, $1125; Coach, $1145; Roadster (*with Rumble Seat*), $1175; Coupe (*with Rumble Seat*), $1245; Sedan, $1245.

Neighborly Notes

Country people have a degree of friendliness and neighborly love that cannot be known or appreciated by the people living in cities. Go into a city to visit and your cousins will not know who lives in the same house with them, either above or below or on either side of them. Perhaps they will not know anyone within several blocks of them. And they suspect everyone. They would not think of speaking to anyone that they had not been properly introduced to. Not so in the country. Here we know everyone for miles and miles around. We not only know them, but we trust them. We know and share all of their joys and all of their troubles. We would not think of suspecting our neighbors, for we love them all; they are our friends.

In the city, you and your family are insignificant. You are only one atom among hundreds of thousands of others. In the country, you and your dear ones are just as important and of as much interest as any one else that is living.

Our cousins in the city go down to shop. They lock up their houses, hang on to their pocketbooks tightly, and speaking to no one, board the street car or elevated. Here, jerking along with the mass, knowing no one, with eyes glued at the tooth paste signs overhead or staring at the dirty children playing in the streets, with smoke and dust obscuring the sunshine, they ride for an hour or more down to the business section. Every block the car jolts and stops. People digging their elbows into each other crowd off and on to the car. Many have to remain standing. The air becomes unfit to enter human lungs. After a long time our cousins reach the loop and with a breath of relief climb out of the car. But their relief is only momentary. Almost at once they are swallowed up by the crowds and pushed and rushed along. Crossing streets is a peril we know nothing of. At night, worn and weary after a day of bargain hunting, they return home having seen no one they knew all day.

How different the tale in the country! We start off gayly for town in our car. Most of our cars are closed nowadays and comfortable, regardless of the weather. Probably we stop twice along the way to pick up a friend who wishes to accompany us or someone we find walking by the roadside. The sun is shining, the birds singing, the flowers and grasses waving by the wayside. In the distance the beautiful green hills rise to meet the soft white clouds in the blue sky. In ten or twenty minutes we are in town. Here everyone that we meet we know and stop to chat with.

When a new baby arrives at one of our homes all sorts of pretty gifts are sent in for the new arrival and broth and flowers for the mother. Each day the neighbors call up to see how they are getting along and give you a few suggestions for naming it. And when someone is seriously ill everyone turns in to help. The women come in and wash and iron; others send in all you can eat. Even the men come to help with the chores or husk corn if necessary. And when all that can be done has been done to no avail, these same dear friends come again and do those things that must be done. Oh, the love that I have for my neighbors and they for me, and how a time of sorrow proves it!

Did you ever hear the story of the two families who were such good friends that they even shared their dinners? These two families loved each other very dearly and were always running back and forth from one home to the other. One Sunday the Coons had company come very unexpectedly just before dinner. Now Mrs. Coon had been very busy all week cleaning house and she had not baked a thing. She had just planned to have a lunch that day. In despair she ran over to Mrs. Mark's and said, "Oh, have you any salmon I can borrow? I haven't a thing in the house for dinner but bread and tea and company has just come."

Immediately, Mrs. Marks replied, "Why, my dear, we'll change dinners. I really have a nice dinner ready for today and you can have it."

And so they carried forth the Marks' dinner for the Coons and their company, and the Marks dined on toast and tea.

Many of us share our cars and radios and some even share their clothes. How very often one neighbor keeps the children of another so that they may go to something that they have planned on for a long time. I have a friend and a neighbor who is so very dear to me. I know that I can always count on her for anything I want done. I have only to suggest it and she will carry it out, whether it is at club or at home. Many of my plans I could not carry out were it not for her; she is the force that makes them possible. And is it not always so? I believe that the neighborly attitude that exists in the country is very largely responsible for that love that we all hold for country existence.—ETHEL MORRISON MARSDEN.

Contagious Health

"Contagious Health" may sound like a paradoxical expression but it could be just as much an actual experience as contagious disease is. We think of catching diseases from others by physical contact either with the person or with the air or some other agent that is contaminated. We do not catch health and happiness in exactly the same way, but it is very true that we do catch both through the mental impressions that we allow to enter our minds.

Spreading contagious health is an individual responsibility. That means unless we get it for ourselves, we will not be able to spread it. So we must first know how to get it. To do this it will be necessary to look into our subsconcious mind and see what happens there.

We know in a sort of abstract way that we have a subconscious mind which takes care of the normal activities of the body without our worrying very much about them. We also know, if we stop to think about it for a moment, that the subconscious mind takes into its maw everything that happens and chews it for a cud. This it does without any encouragement on our part and we are never sure when the idea that once got into the mind will pop up again.

Another curious thing about the subconscious mind is that it is most impressionable just about the time we are going to bed. Every woman, I know, has dozens of experiences that will demonstrate this theory. I had one myself recently. We went out in the evening and returned rather late. I wanted to do the dishes before going to bed because I had a full day's work planned for next day.

Just as I was about to put my hands into the water it occurred to me that I should take my ring off. At the same moment I thought that my apron pocket was not a safe place for it. I cannot tell even at this moment whether or not I took my ring off, but I remember that I woke up in the night several times with the thought that my ring was not on my finger and that it was not in a safe place. But I was so sure it was in my apron pocket that I went off to sleep again.

Next morning I woke up with a feeling that there was something I should be worrying about and then suddenly the thought of the ring occurred to me. Next thing I knew I

Compare a Radiola 20 with any competitor – at any price

COMPARE it in quality of musical reproduction! Tune in, yourself, and listen! Test it as the experts do . . . listen at least ten minutes to the Radiola 20, with an RCA Loudspeaker 100. Then switch to another set, and your ear—trained to the clearer music—shows up the difference in an instant! Radiola 20 has challenged any competitor, regardless of price, to this comparison of tone. And thousands of tests have proved it finer.

Compare it for performance, too! It is twenty times as selective as the ordinary radio set—and has the distance reach of larger sets that have more tubes. A special form of "amplification" makes this possible. On near stations, it is single controlled. And on far stations, two verniers add sharp accuracy to distance tuning.

And look into its reputation for dependability! If there's one thing about radio that is most important for the farmer, it is that. Will his set work every time he tunes in?

Radiola 20, with Radiotrons, . . $115
RCA Loudspeaker 100, ... $35

Will it stand up under daily use without servicing and tinkering? The Radiola 20 —with all the skill of RCA, General Electric and Westinghouse behind it, has *proved* its sturdy quality. It is no experiment—but thoroughly tried, tested and perfected.

What a big place in the farmer's day this Radiola fills! It brings in the weather and market reports so clearly—and the helpful lectures from the agricultural colleges. There are talks, lectures, news and stories for Mother and the children. Fun and entertainment every evening. The best dance music. And the world's finest singers and musicians. And with broadcasting getting better and better, the Radiola 20 is replacing thousands of other sets—to match the finer programs with finer reception!

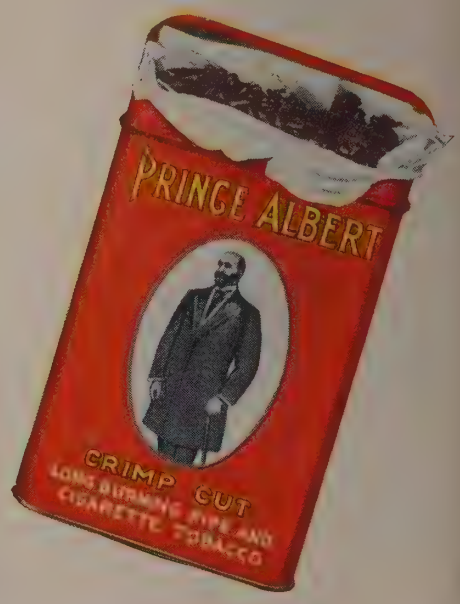
At peace with the world



PEACE and contentment, I say, are not a matter of how much money you have accumulated. They come with a clear conscience, good health, and the right companionship. No comrades mean more to me today than my trusty pipe and good old Prince Albert.

I start the day with a pipe in my mouth and a song in my heart. It has been like that for a good many years now. Before I settled upon Prince Albert as the one and only tobacco for me, I had "played around," as you young fellows say, with many brands.

I think it was the rich, rare fragrance of P. A. in the tidy red tin that spurred me to try a load of it in my pipe. I found the taste more than matched that wonderful aroma. It was cool. It was sweet. It was mild . . . mild, yet completely and delightfully satisfying.

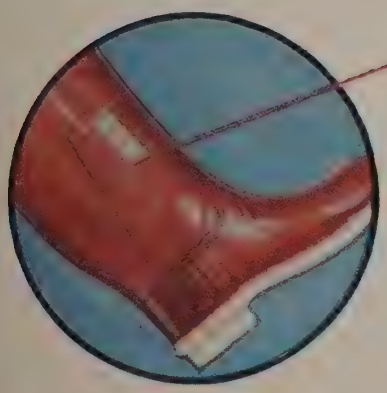
Perhaps a leaf from my book of experience will set you on the road to peace and contentment. I tell you, in all seriousness, that you don't know . . . you simply can't know, how much your pipe can mean to you until you have filled it with Prince Albert!

P. A. is sold everywhere in tidy red tins, pound and half-pound tin humidors, and pound crystal-glass humidors with sponge-moistener top. And always with every bit of bite and parch removed by the Prince Albert process.

PRINCE ALBERT

—no other tobacco is like it!

© 1927, R. J. Reynolds Tobacco Company, Winston-Salem, N. C.



In the dairy barn—*and everywhere the farm job takes you—these "U.S." Blue Ribbon boots will keep you dry-shod and comfortable. And they are as husky as they look!*

Farm tested . .

This "U.S." Blue Ribbon Boot *stands the hardest wear . .*

"U.S." Blue Ribbon Boots
come in red or black—sturdy gray soles—knee to hip lengths

Stretches five times its length!

If you cut a strip of rubber from a "U.S." Blue Ribbon boot or overshoe—you'd find it would stretch more than 5 times its length! This rubber stays flexible and waterproof—long after ordinary rubber would crack or break

75 YEARS of experience in boot-making by the largest rubber manufacturer in the world—that goes into every "U.S." Blue Ribbon boot. This boot is *built* to stand every farm test.

It's just as husky as it looks—extra strong, every inch of it. You can't kick through that thick, oversize sole—it's as tough as the tread of a tire.

And the uppers — they are made of the finest rubber — rubber so elastic that you can stretch a strip of it more than five times its own length! No wonder, where inferior rubber splits and cracks, "U.S." Blue Ribbon boots stand up!

And at every vital point where wear is hardest, from 4 to 11 separate layers of tough rubber and fabric are anchored in behind that strong surface—to give *extra* strength. Only "U.S." Blue Ribbon boots and overshoes have so many!

, , ,

We know you will like the plus farm value in "U.S." Blue Ribbon boots and overshoes.

Every pair is built by master workmen—and built *right*. They fit better, look better, wear better. Get a pair and notice the difference.

United States Rubber Company

The "U.S." Blue Ribbon Walrus
slips right on over your shoes. Its smooth rubber surface washes clean like a boot. Made either red or black—4 or 5 buckles

"U.S." *Blue Ribbon*

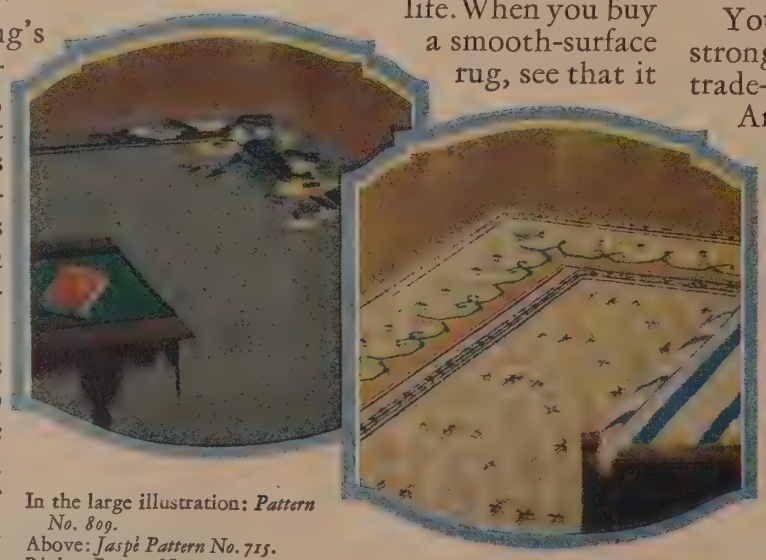
Genuine Cork Linoleum Rugs in NEW–DIFFERENT–PRETTIER *Patterns*



These lovely new patterns come only in the New Armstrong Rugs!

EXCLUSIVE DESIGNS, brand-new ideas of coloring and pattern—the new Armstrong Rugs instantly appeal to your love of the beautiful when you see them in home or store! Picture a daringly colorful border enclosing a two-toned field of small-figured carpet pattern—a rug that will "fit in" with the furnishings of 'most any room.

Picture, too, a rug of Armstrong's Jaspé Linoleum in rippling soft-toned gray, green, blue, or brown, with a decorative border of unit design . . . nothing prettier has ever been created in a smooth-surface rug. These fascinating rugs you will find in the stores if you make sure to ask for the new *Armstrong's* Linoleum Rugs.

You can hardly believe that rugs so unusually handsome can be so inexpensive. They are genuine Armstrong's Cork Linoleum with the burlap back . . . no other smooth-surface rugs offer so much in texture, beauty, wearing quality.

Soft and flexible, an Armstrong's Linoleum Rug can be rolled and moved from place to place. Its sturdy burlap back keeps it whole and gives it longer life. When you buy a smooth-surface rug, see that it is real linoleum—resilient, quiet, springy to the tread, and long-lasting. A rug of Armstrong's Cork Linoleum will wear and wear and wear!

In the large illustration: *Pattern No. 809.*
Above: *Jaspé Pattern No. 715.*
Right: *Pattern No. 931.*

You will know the genuine Armstrong's Linoleum Rug by the Circle A trade-mark on the burlap back. These Armstrong Rugs come in the larger room sizes, 12 ft. by 15 ft. and 12 ft. by 12 ft., as well as in the usual smaller room sizes.

"RUGS OF PRACTICAL BEAUTY"

This booklet, printed in full colors, showing a fascinating array of these new rugs, will help you select the new pattern that will just fit your room. It is free. Send for it. Address Armstrong Cork Company, Linoleum Division, 1013 Jackson Street, Lancaster, Pennsylvania.

Pump Hot Water

from your kitchen pump

TURN a small handle. Steaming hot water gushes forth at every stroke of the pump. Turn the handle back and pump cold water.

Easily Installed

The Perfection Kerosene Water Heater and tank are connected with your kitchen pump by our simple, new method. In 10 minutes enough hot water for dishes, in 30 minutes for a bath, and in 5 minutes for shaving or washing up. No smoke. No odor.

The heater works equally well if you have running water instead of a pump.

Four Models

Choice of four models. Two have thermostats which put out the flame when the tank is hot. One has a 30 gallon "Stay Hot" storage tank. This keeps the water hot for 3 hours after the flame is out. All burn kerosene—the cheap fuel.

Free Booklet

Ask your plumber or write for full description and prices.

Hot water for "washing up" in 5 minutes! Model 411

PERFECTION Kerosene Water Heaters

had a headache, and then I found the ring was lost. I searched for hours. I did not know whether it got into the stove or into the garbage or whether I had thrown it out with the dish water. Later in the day I found it on the living room floor, and I honestly do not remember having gone in there. My memory failed me, but my subconscious mind held on to the idea that I did not put a thing in its proper place. It would have carried the idea of safety and security for me all night had I taken my ring and put it on my dresser. The idea of safety would immediately defeat the idea of insecurity and the subconscious mind would have been chewing on that all night. I suppose I would have awakened in the morning with a glad sense of everything-is-all-right instead of a headache.

The happy person is likely to be the well person. Have you ever met a real happy-go-lucky person that did not make you feel the same way? You can do like that happy-go-lucky person and infect everybody you meet with a feeling of health and radiance if you will just keep in mind that you must constantly suggest health, the good, the beautiful, and the happy thought.

You may meet a friend today. You might say, "My dear, you need a rest. I am telling you this for your own good." She will go home, look into her mirror, and think: "Isn't it the truth? That woman is right. I must lie down at once." Next time you meet her, say, "My dear, you are looking wonderful. Is it a new gown or did you have your hair bobbed or something." It will truly leave her in an entirely different state of health.

Doing the natural and simple things are always the ones which lead to normal health. An evening with music, with a good book, cheerful conversation, or the reading of such passages from the Bible as the Twenty-third or the Ninety-first Psalm will be exactly the right things to put one in the right frame of mind before going to sleep at night.—S. K. ORMOND.

Accepting Favors

"Why, Mary," said Hazel, "I wouldn't rush right over there with a loaf of bread just because she brought you a few cookies!"

"Well, I don't care if you wouldn't; I would," retorted Mary. "I believe in being independent. Anyway, you know it's more blessed to give than to receive and I intend to hold up to that."

"Yes," protested Hazel, "but how about Mrs. Jones when she gave you the cookies? Isn't it more blessed for Mrs. Jones to give than to receive, too, and shouldn't you let her get a little of the blessing before you rush back and give her something just to satisfy yourself?"

Mary was irritated at her sister and refused to see the point but she confessed the next day that she had never thought of it that way; she was, as she said, the independent sort. It's nice to be independent; that is, most of the time it is nice but once in a while you meet a person who makes a god of being independent and when I see one of that sort I give up. Looking around I feel somehow that it is the women who overdo the matter of being independent, but maybe I am wrong. There's the type like Mary, whom we all know. If her neighbor runs in with a few doughnuts, she can't rest until she has taken back an elaborate pie. If Mrs. Smith gives her a lot of outgrown baby dresses, she must immediately make Mrs. Smith an elaborate center piece in spite of the fact that Mrs. Smith had absolutely no use for the baby clothes and took a joy in giving them. Nevertheless, Mary has that uncomfortable feeling that she is "under obligation" to Mrs. Smith.

Deep down in most of us there is something that prompts us to get part of our pleasure in life by giving to others and doing for them and if we are robbed of this we feel that something is wrong. If we reason back far enough we can convince ourselves that this desire to give is just a form of selfishness. We want to be happy; giving makes us happy so we give in order to get happiness—selfishness proved! But what's the use in going around Robin Hood's barn like that with our reasoning? Let's be independent enough, yes. But let's not have so much pride as to spoil the pleasure of others in simple giving. There is just as true a graciousness about accepting as there is about giving and real independence involves our knowing how to do both. —LUCY THOMPSON.

Alphabet Macaroni

Amusing a sick child—or one that has been sick and must be kept quiet for a complete recovery—is no small task and most mothers will welcome a new idea along this line.

One mother whose child was convalescent but still had to stay in bed, sent to town and got a package of alphabet macaroni which is nothing but regular macaroni cut up into letters of the alphabet. Into each dish of the soup which the little boy needed every day she put the letters to make a certain word. Of course they went to the bottom and the child had to eat the soup before he could find his word. The first day it was his own name, then the name of the dog, then the name of the man who carried the mail, and so on. A sick child will quickly wear out most any form of entertainment but this one lasts unusually well. It is fun at a children's party, too, and when they are too small to spell out words they still enjoy identifying big A, little a, and all the rest.—LUCY THOMPSON.

Father and Child

"The child's appetite is trained just as its habits are formed," states Miss Grace Pollock, National Dairy Council specialist in Pennsylvania. "If left undirected, he will imitate the ones about him in the foods he learns to like and dislike.

"I always wish I could have an opportunity to speak to the fathers, for I am convinced that the father can do more harm in one remark about his dislike for a certain food than weeks of training by a mother can do

good. It is the ambition of all small children to grow big like 'daddy' and if 'daddy' grew without carrots, of course the small progeny will see no good reason for learning to eat carrots. There is a brighter side to this, however, for by virtue of the same adoration that most fathers justly receive from their little children, the father can be an invaluable help in training the child to eat all foods that are given him.

"I know some of you are wishing you could see me try to coax your small son or daughter to take some of the essential foods, such as vegetables, fruits, and sometimes milk," adds Miss Pollock. "But what worth while lesson is not hard to teach? A child cannot be trained to be polite in one lesson. Appetite for all good, wholesome food cannot be cultivated all in one day, one month, or one year, perhaps, but constant effort and rewarding, if necessary, will some da repay in sturdy, healthy, and happ children."

No. 2973—Two-Piece Dress. Cuts in sizes 16, 18 years, 36, 38, 40, and 42 inches bust measure. The 36-inch size requires 3¼ yards of 40-inch material with 1⅛ yards of 27-inch material for camisole.

No. 2975—Practical Dress. Cuts in sizes 16, 18, years, 36, 38, 40, 42, and 44 inches bust measure. The 36-inch size requires 3⅛ yards of 40-inch material with ⅝ yard of 40-inch contrasting.

No. 2051—Attractive Apron. Cuts in sizes small, medium, and large. The medium size requires 2 yards of 36-inch material with 7 yards of trimming.

No. 2652—Striking Junior Frock. Cuts in sizes 6, 8, 10, 12, and 14 years. The 8 year size requires 1⅝ yards of 40-inch material with ⅝ yard of 32-inch contrasting.

No. 2770—Men's and Boy's Shirt. Cuts in sizes 12½, 13, 13½, 14, 14½, 15, 15½, 16, 16½, 17, 17½, 18, 18½ 19 inches neck. Size 15½ requires 3½ yards of 36-inch material.

No. 2190—A Play and Sunday Frock From One Pattern. Cuts in sizes 2, 4, and 6 years. The 4 year size requires 2⅛ yards of 40-inch material.

Hand Lotion

Here is our family recipe for har lotion: Buy a 25-cent bottle each glycerine and bay rum—mix the two liquids if you wish by turnir both into a large bottle and shakir well. Use a small quantity of this hands before retiring each night a after dish washing, if possible. R well into the skin—it may feel qui gummy but will be absorbed quickl I hope you may find desired result

Minnesota. M. E. GRIFFITH.

The best hand lotion I have ev found is bay rum, glycerine, and le on juice, equal parts. Wash the han with warm water and then apply.

(MRS.) F. L. JACKSON.

North Dakota.

Grease hands well in the eveni with Mentholatum and put on cle canvas gloves. In the morning th will be nice and soft.

Wisconsin. EVELYN HOYUM.

Get from your druggest a 10c pie of slippery elm bark, 4 ozs. glycerir and about 5c worth of rose wat Boil the bark in a quart or six-pi pan in water to cover. When cook enough the water will be thick a slippery and should be about a cu ful. Now put the glycerine and e water, in about equal parts or a lit more of the water, in a large bot and shake well, adding rose water f odor. This keeps indefinitely and also beneficial after shaving and f chapped lips and cheeks.

(MRS.) CHAS. A. SWANSON.

Indiana.

We are boosters for Hoard's Dai man at all times. My hand lotion ca be beat: 6 tablespoons vinegar, tablespoons glycerine, 2 tablespoo bay rum. Shake well in bottle and u while hands are damp. Fine for co huskers.

Illinois. (MRS.) S. L. BELSLY

The Toy Bank

Said a little iron pig:
"I'm not very big
And I never, no never, shall grow;
My diet is funny,
I live upon money,
Because I'm a bank, don't you know?

"I sing clinkety-clank,"
Said the toy pig bank;
"Whenever a girl or a boy
Gives me money to eat
To me it's a treat—
Helping children to bank is a joy."

—MAUD WOOD HENR

It is in this way that many b and girls get their start for colle One dislikes seeing a child too terested in saving money for fea may lead to penuriousness, but healthy desire to make and save p nies is a good sign.

Of course there is never much tra money to pay out to children the form of wages but where it be done, a little reward for work h estly done is very stimulating.

—LUCY THOMPSON.

Likes Kitchen Range Bes

In a recent issue there was an ticle on "Furnace Cookery." We h a furnace but give me my kitch range. Once, when I was a youngs in town, the gas was shut off for pairs so we baked potatoes in the f nace. That was a lark!

But think of the time and ene expended going down cellar to wa carefully whatever you are trying bake. Surely we farm mothers more worth saving than a few ce worth of fuel.—GLADYS B. MILLI.

Dairying in the Desert

(Continued from page 235)

ground, leaving the stoves to a longer process of decay.

Get Milk At Green River

We reached Green River, a village of possibly 500 inhabitants, at noon. The town had been so named because of the sluggish stream that flowed through, but we concluded that the river must have gotten its cognomen from the green trees that grew along its banks rather than from the color of the water which was not unlike that of the "Big Muddy." We anticipated no difficulty in getting our thermos bottle filled

THE ONLY MILCH COW IN THE DESERT VILLAGE OF CISCO, UTAH
She is owned by the storekeeper but her milk is not for sale.

with milk in a town of this size because we had seen a few cows in an irrigated pasture nearby. After trying at all the grocery stores and the two butcher shops, however, we found that the only place we could buy milk was at a private home. We called there and got the last quart they had. For this we paid fifteen cents but we were glad to get it at any price. We then drove out of town and ate our lunch in the shade of a railroad bridge.

Find Profitable Dairy

Toward the end of the afternoon we passed out of the land of perpetual desert into an irrigated section where alfalfa fields again gave the landscape a note of cheer. We had never appreciated green grass and beautiful trees so much as we did these after our long ride through a sun colored country. Perhaps the herd of grade Holsteins that first met our eyes did have their faults, but the sight was so unusual that we decided to stop and visit with the owner, E. H. Thayn.

The senior Mr. Thayn was not at home but his two sons, Homer and John, were glad to show us around and give us an account of their dairy experiences. They were milking 29 cows at the time so their herd was the largest in Carbon County, Utah. Up until three years ago, when they purchased a 320-acre farm in the Price River conservation district, they had kept their cows in a barn at Wellington and had purchased all their feeds. Before that they had run range cattle but neither Mr. Thayn nor his sons liked beef cattle very well.

The Thayns sell their milk wholesale to a distributor in Wellington for 25 cents a gallon on a 3.8 per cent fat basis or 22 cents on 3.4 per cent basis. They get about 23 cents a gallon as an average all the year around. The distributor then sells the milk to residents of Price and to miners in the coal camps of Spring Canon. The milk checks for last year totalled $5,720 and the feed bill was $1,734, so the profits on their year's business was quite satisfactory.

Only forty acres of the farm were capable of being watered at the time. The remainder was sagebrush and desert land but as soon as the Price River reservoir is completed they will be able to irrigate most of it. The 40 acres under water were entirely in alfalfa pasture except what was cut for hay. So far no trouble has been encountered with bloat, but the cows are in the pasture all of the time and the land is comparatively dry. This may account for their freedom from this trouble. We talked with many in the irrigated sections of the West, however, who had not been so fortunate with alfalfa pasture. The boys expect to try some sweet clover for pasture as soon as they get more water so they can increase their farming acreage. When we asked what kind of records the cows had made they could not give any yearly ones because no cow testing association has started there yet and they had not thought to keep records of their own accord. Their best cow, however, made an average production of 7 gallons a day for 31 days last spring and they estimated that the average production per cow would be about 3 gallons a day for the entire herd. They feed a grain ration of 50 per cent ground corn and 50 per cent bran at the rate of one pound to four or five pounds of milk. They still buy their concentrates from grain growers farther down the valley, but they expect to grow their own just as soon as possible.

Both of the boys have been active in club work and owe much of their interest in dairying to this. Homer is now a boy scout leader so he is doing all he can to make rural life more enjoyable for the neighbor boys. It was a pleasure to listen to these young dairymen of tomorrow tell of their plans for conquering the desert on their farm and developing a better herd of cows at the same time.

NASH

Leads the World in Motor Car Value

The Special Six
$1215
f. o. b. factory

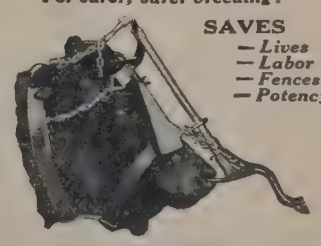
This Car Has the Vital Superiority of a 7-Bearing Motor

The outstanding beauty and quality of this Nash Special Six Sedan is united with equally outstanding performance ability.

With its big Nash 7-bearing motor it has a power-*smoothness* and power-*quietness* that cannot possibly be approached by the older motor types in which the crankshaft is supported by only 3 or 4 bearings.

And the *plus*-value Nash puts in every car is emphatically demonstrated anew here for it costs much more to build the modern 7-bearing motor than the 3 or 4-bearing type.

So that on a dollars and cents basis of what you get for your money Nash gives far more in quality construction as well as in performance ability.



Note closely these other quality attractions that are included in the price as standard equipment: Gabriel snubbers at the front; 4-wheel brakes of special Nash design, lightning fast in operation, and equalized perfectly to all four wheels; and five disc wheels.

In addition to this Special Six Sedan Nash builds 22 other models in three series—*Light* Six, *Special* Six and *Advanced* Six—and 4 wheelbase lengths. Every model is powered with a 7-bearing motor and the price range is from $865 to $2090 f. o. b. factory.

"That New Fence – the Best Investment I ever Made!"

GOOD fencing costs money. That's all the more reason for putting it up right at first—on RED TOP Steel Fence Posts. By keeping the fence in good condition RED TOPS prolong its life and service. And they save many hours of time and labor, not only because they can be installed so much faster, but because they eliminate all yearly repairs and replacements. They outlast 4 or 5 ordinary wood posts.

Red Top
GUARANTEED
Steel Fence Posts

You'll be surprised how fast you can build a fence with RED TOPS. They have revolutionized both fence building and repair. Without a helper you can drive 200 to 300 RED TOPS in a single day with the RED TOP One-Man Driver. And you can drive RED TOPS through hard soil in which you wouldn't attempt to dig a post hole.

With the RED TOP Post Driver one man can drive 200 to 300 posts a day

Plan this year's fence building and repair now and start the work right away. Go in at once and talk to the RED TOP dealer in your town. He is good authority on fencing materials and fence construction. That is why he was selected to represent RED TOP. Let him help you solve your fencing problems once and for all—economically. Ask him for a copy of "Saving Time and Money in Fence Building."

Mention Hoard's Dairyman to Your Dealer—It Helps Us

These pigs are at the fighting age. Sore mouth may be partially prevented by removing the sharp ends of the tusk teeth. In cutting these, care must be exercised not to break the gums. To do so makes an ideal place for "necro" infection.

It's Good and Bad for Pigs to Fight

Most of us enjoy watching a scrap and no doubt all of us who have watched the antics of little pigs would rather see two evenly matched rascals have it out with each other than to send them about their business. If this fighting went no further than affording exercise for the combatants and amusement for the spectator it would be fine but the battles frequently draw blood and right here is where the dirty work gets in.

These skin abrasions about the gums, lips, and face frequently become infected with disease germs, by name, *bacillus necrophorus*, causing what is commonly known as "sore mouth," "necro," or "dermatitis." Even the teats and udders of sows become infected. If the condition is not watched closely and treated immediately it will progress within a few days to a stage that is almost impossible to cure.

The question comes up frequently as to whether the little sharp tusks used so fiercely in the fighting should be removed, thereby depriving the pigs of a means of cutting each other. One well known authority on swine diseases is of the opinion that these tusks had better be left in than be broken off in such a way as to cause sores at their base and thereby invite infection in places not easily treated. If anything at all is done to these teeth it should be merely that of snipping off the sharp ends just enough to curb their cutting. Care must always be taken to prevent any breaks in the gums at the base of these teeth.

In treating "sore mouth" the chance for success is very much increased if done early. The dead or necrotic tissue of the sore should be removed and tincture of iodine applied. A badly infected litter should be separated from the other pigs. The disease is less likely to occur where proper sanitary precautions have been taken.

How Many Pigs Per Acre

In planning pastures for hogs the question of the number of hogs per acre that a given pasture crop will carry successfully is of some importance in the economy of the use of land.

The three pasture crops that stand out best and produce the most pork per acre are alfalfa, rape, and red clover in the order named. In prime condition these three crops will carry about the same number of hogs per acre though the alfalfa furnishes good grazing for a longer period. These crops will carry from 20 to 30 spring pigs per acre and from 15 to 20 mature hogs per acre.

Rye seeded in August furnishes good grazing during a part of September and October and also early pasture the following spring. It will carry up to 15 spring pigs and 8 to 10 mature hogs per acre.

Spring seeded oats will carry 9 to 10 mature hogs for about 6 weeks. Oats and rape will carry 10 to 12 mature hogs per acre for a longer period, depending somewhat on how the rape comes on after the oats are spent.

A seeding of four pecks each of oats and field peas per acre combined with 4 or 5 pounds of rape will carry 12 to 18 mature hogs per acre. The pasture season may be extended by seeding the mixture at 10-day intervals for two or three seedings.

Soy beans, while furnishing excellent forage for a limited period, do not have enough "come back" to warrant being recommended. The crop is too easily damaged by the wear and tear of grazing.

Best Pig Rations Low in Fiber

In feeding pigs the factor of the amount of fiber in the ration is frequently overlooked though it has an important bearing on the rate and economy of gain.

The cow, sheep, and horse have digestive tracts suitable for handling large amounts of coarse, fibrous feeds; this is not true with pigs.

Experiments have shown that alfalfa hay, though containing a high quality of protein, other nutrients, minerals, and vitamins, will barely maintain hogs if fed as a sole ration. Alfalfa hay contains about 28 per cent of crude fiber.

Other experiments have shown that such feeds as wheat bran containing 10.2 per cent of crude fiber; barley shorts containing 10.1 per cent of crude fiber; oats bran, 18.3 per cent; barley bran, 19.3 per cent; oat hulls, 29.2 per cent; oats, 10.9 per cent, when fed alone are too high in fiber and poor results are obtained.

Some experiments conducted at the Oregon Experiment Station indicate that the fiber content of a grain mixture for pigs must not be over 5.5 per cent if good results are to be expected.

Pasture Alone Not Enough

That it is not profitable nor advisable to attempt to grow pigs on pasture without grain is shown by some work done at the Kentucky Station a few years ago. Some pigs weighing 63 pounds each were turned on rye pasture on March 19 and kept there for 42 days, no grain being fed. They did not maintain their weight, in fact they lost 5 lbs. during the time. Some other pigs weighing 82 lbs. each were turned on clover and bluegrass pasture on May 13. On July 4 these pigs averaged 90 lbs. each, having gained only 8 lbs. in 53 days.

Bonus For Quality Milk

With the chance to make a 40 cent bonus over a $2.50 per hundred weight flat rate for 3.5 per cent milk, Walworth County, Wisconsin, farmers have the opportunity for not only doing the production job better, but also are paid according to their pains.

No small credit for this splendid opportunity to realize large profits from the dairy herds of the county is due to the efforts of their county agent, L. J. Merriam. The matter of producing quality dairy products has been one of his perennial county wide projects. He has also urged the improvement in the production units of the dairies of his county by stressing the use of bred-for-production pure-bred bulls, and as a check on what the cows of the county are doing, the cow testing association.

A Chicago milk distributor made an offer to Lake Geneva farmers to deliver to their plant in Lake Geneva the best quality milk they could produce, to be bottled as grade "A" milk for the Chicago retail trade. They offered a bonus of 40 cents a hundred for milk showing a bacteria count of less than 10,000 to a cubic centimeter, and 25 cents if it came between 10,000 and 20,000; this over the flat rate, which throughout the fall has been at about $2.50 a hundredweight.

It was not long before farmers in the vicinity of Lake Geneva saw in this their opportunity to be paid according to the merit of the product they delivered. This was over a year ago, and on the first day 40 farmers brought their milk to the Chicago bottling plant. Within a month, the number had doubled, and at the present time 97 patrons deliver their milk to this factory. When the November accounts were settled, all but one of the 97 patrons received either a 25 cent or a 40 cent dividend. One farmer drives 14 miles to get in on the good prices. If ever a patron fails over a certain time to make his bonus, he is dropped and one of a now long waiting list is substituted.—Wisconsin College of Agriculture.

Beet Pulp and Soy Bean Hay

My roughage consists of dried beet pulp and soy bean hay. I want to mix ground oats, corn hearts, bran, and cottonseed meal with water and blackstrap molasses, soaking this about 12 hours before feeding. What proportions should be used? Would corn meal be better than the corn hearts? How much molasses should I use? Will I get better results from this mixture soaked or fed dry?

Jackson, Miss. G. P. R.

The proportions to mix the concentrates depend somewhat on the proportions of feeding the roughage. Dried beet pulp is really a carbonaceous concentrate supplying considerably more of total nutrients than is supplied in the ordinary roughage. It is comparatively low in protein. The soy bean hay is comparatively rich in protein being as good as alfalfa in this respect. Thus if only a small amount of the dried beet pulp and a large amount of the soy bean hay are fed, the supplemental mixture need not contain more than 10 to 12 per cent of digestible protein; whereas, if this proportion is reversed the protein content of the concentrates mixture will have to be higher because of the carbonaceous character of the beet pulp fed in proportionately large quantities and the reduction of the high protein soy bean hay.

In making a suitable concentrates mixture it is necessary therefore to assume the proportions of dried beet pulp and soy bean hay fed. Let us assume this to be 7 lbs. of dried beet pulp and 14 lbs. of soy bean hay daily per head. This combination in itself contains a greater proportion of protein than is required in a well balanced ration. To properly balance it with concentrates will require feeds of high carbonaceous character and low in protein. Such feeds are corn and blackstrap molasses. We would include some ground oats and cottonseed meal for variety, the latter partly because it is one of the cheapest feeds at the present time. We suggest the mixture of 400 lbs. of corn meal, 200 lbs. of ground oats, and 100 lbs. of cottonseed meal. To this we would add enough molasses as would give each cow between 2 and 3 lbs. per head daily.

The reason for substituting corn meal for corn hearts is that the meal likely supplies the kind of nutrients needed cheaper and in greater amount.

The amount of molasses to use depends somewhat on the price compared with other carbonaceous feeds like corn. The molasses will increase the appetite for feed. It does not contain as much nutrients as corn but feeding trials indicate that it is nearly equal to corn. One could feed up to 5 lbs. per head daily with safety.

If molasses is mixed with the dry concentrates there is nothing to be gained by soaking the mixture.

If less of the beet pulp is fed in proportion to the soy bean hay, the percentage of protein in the concentrates mixture could be reduced by putting in less of the cottonseed meal, but with feed price relations as they probably are it would not reduce the cost of the ration.

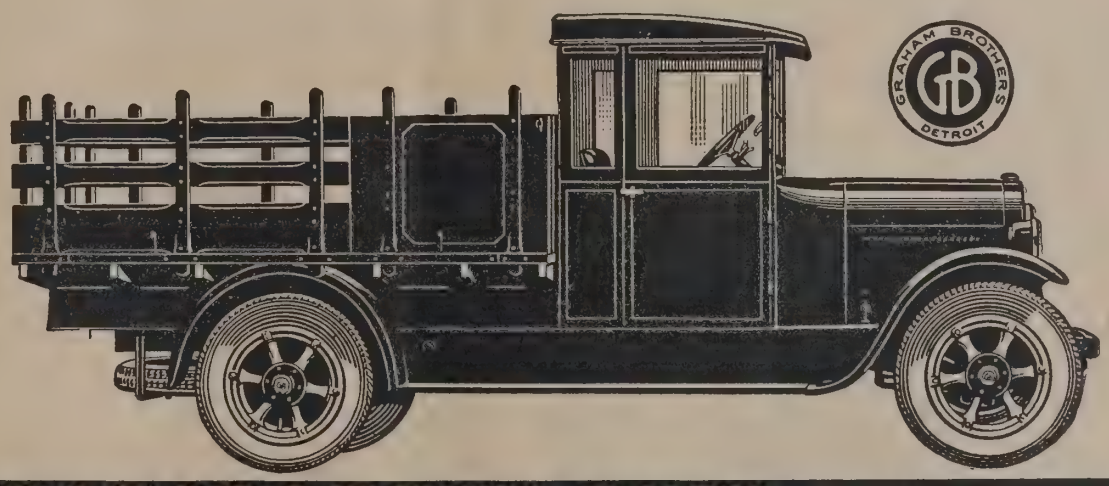
GRAHAM BROTHERS TRUCKS

$885

1-Ton Chassis F.O.B. Detroit

Think of a 1-Ton truck chassis, of Graham Brothers quality, at $885! . . . The famous G-BOY! . . . Only great production volume makes it possible.

Swift, trim-looking, sturdy, powerful—the G-BOY has set a higher standard of quality and performance by which motor trucks must be measured.



Rugged frame, heavy duty rear axle, 35 brake horse power, 30x5 heavy duty high pressure truck cord tires—the G-BOY is quality throughout. And Graham Brothers bodies are built to fit your business.

Graham Brothers trucks and commercial cars meet 91% of all hauling requirements.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

How to Inoculate Legumes

Now is the time, boys and girls, to get ready to plant alfalfa and sweet clover. We will assume that you have taken care of the lime needs of the field where you are going to sow one of these legumes this spring. If you want to be sure of a good catch, you will inoculate the seed.

The process of inoculation described here can be applied to any of the more common legumes. Remember, though, that one kind of bacteria will *not* inoculate all kinds of legumes. There are eight general groups, each of which requires its own special kind of bacteria. For example, alfalfa bacteria will inoculate all legumes listed in group one, but will not work on any other legume. The classification is as follows:

1. **Alfalfa,** biennial white sweet clover, biennial yellow sweet clover, Hubam, bur clover, yellow trefoil, and fenugreek.

2. **Red Clover,** mammoth, alsike, crimson, Egyptian, and white Dutch clover.

3. **Peas,** garden, canning, field, hairy vetch, spring vetch, wild vetch, broad bean, lentil, sweet pea, and perennial pea.

4. **Cowpea,** peanut, Japan clover, velvet bean, lima bean, partridge pea, wild indigo, and tick trefoil.

5. **Bean,** garden, field, navy, kidney, wax, and scarlet runner.

6. **Lupines** and serradella.

7. **Soy beans** are inoculated with the bacteria isolated from the soy bean nodule only.

8. **Wood's clover** (Dalea) is inoculated with the bacteria isolated from the nodule of that legume only.

Inoculation means the introduction of bacteria into surroundings suitable for their growth. We sprinkle legume seed with the right kind of bacteria and when the plants grow, other conditions being all right, these germs will multiply millions of times and form nodules or little bunches on the roots. These bacteria that live in the nodules take the nitrogen from the air and change it into plant food.

Inoculation insures the yield. The Wisconsin Experiment Station reports that in 1925 the inoculated plants in one field of alfalfa weighed four times that of uninoculated plants.

Inoculation makes the soil richer. While the amount of nitrogen fixed by inoculated plants varies depending on the soil, season, kind of legume, and method of handling, an average of all legumes is 50 to 100 lbs. nitrogen fixed per acre a year. Unless the plants have these nitrogen-fixing bacteria on their roots they will take nitrogen out of the soil for their growth. Then, too, we must consider that on some soils legumes save much nitrogen from being washed away.

INOCULATION MADE THE DIFFERENCE

Inoculation increases the quality of the legume plants. It makes them richer in protein, thus making better feed. At the Wisconsin Experiment Station it was found that in every ton of tops from inoculated alfalfa plants there were 305 lbs. of protein, while every ton of uninoculated alfalfa tops contained only 227.5 lbs. of protein. This difference was determined by chemical analysis and could not be seen in the field.

The movie film on this page shows the different steps in inoculating legume seed, in this case alfalfa seed or sweet clover. Follow it right down from top to bottom and you have a pictorial story of how to inoculate. There are other methods of inocula-

INOCULATION DOES IT. NODULES ON THE ROOTS OF A LEGUME

In these little houses live millions of tiny bacteria, wonder workers that gather nitrogen for the plant from the air.

on, but this is perhaps the simplest id most satisfactory.

First, the material—a bottle of ulture," a big pan, tub, or receptae for holding the seed, and the rections.

By culture we mean the bacteria id the food in which they are growg, in this case agar jelly.

Cultures are easily obtained at a w cost. Many state agricultural lleges are distributing them or they ay be secured from commercial seed uses. The bottle culture shown in e film was purchased from the Wisnsin College of Agriculture and sts residents of the state 25c. There e enough bacteria in one of these ttles to inoculate 20 lbs. of alfalfa sweet clover. It takes from 12 to lbs. of this seed to properly sow e acre.

Fill the culture bottle about twoirds full of cool water. In the ovie film the demonstrator is pourg the water from a small milk bot-.

Put the cork back and shake the ttle and contents well as in the ird picture. You cannot dissolve e jelly with cool water, so don't y. The object of this step is to ash the bacteria off the jelly into e water.

Sprinkle the liquid over the seed ich you have ready in the pan or b, as you see in the fourth picture.

Moisten the seed fairly well; if cessary you can refill the culture ttle with water. There are enough cteria left on the jelly to make e repetition effective.

Now, mix the seed thoroughly as in e fifth picture and spread out in me cool, shady place on a canvas or wspapers. The seed should be nted and harrowed in as soon af- inoculating as possible. The bacia live and multiply in the water the seed but die when the seed ies and their food supply is thus ut off. Undue exposure to the sunht will also kill the bacteria.

Our Review Column

A regular feature of the junior department, viewing the contents of Hoard's Dairyman of the previous issue. Let's talk it over.]

For a more complete discussion of e following see the February 25th ue.

What is the backbone of a good iry ration? A succulent roughge, such as silage, and good legume y. (See page 176.)

What are the maintenance and oduction requirements for a cow ighing 1,100 lbs. producing 40 lbs. 4.5 per cent milk daily? About 5 lbs. of protein and 23.5 lbs. of tal digestible nutrients. (See table page 176.)

Which breed is such a cow rather pical of? The Guernsey. (See ge 177.)

Where did the Guernsey breed ginate? On the Channel Islands ich belong to England and are lo-ed somewhat nearer the north ast of France. The three islands oted to this breed are Guernsey, derney, and Sark.

When was the first importation de into the United States? In 18 by Reuben Hains of Germanwn, Pennsylvania. Another imtation of a bull and two heifers s made in 1833 by a sailing capn who sent them to his brother in w Hampshire.

When was the American Guernsey ttle Club organized? In Februa-, 1877. The Club is celebrating fiftieth anniversary with a pilgmage to Guernsey this spring. rilla Boese, a Wisconsin calf club mber, has been awarded a free ip because of her outstanding club ord. (See page 192.)

What is the world's record for Guernsey production? Anesthesia Fth of Hill Stead, a Connecticut cow, produced 19,742 lbs. milk, 1,112.5 lbs. fat.

How may the mineral requirements of poultry be met? Provide lime in coarse oyster shell and lime rock grit fed in hoppers, provide fine table salt at the rate of one per cent in the mash, and calcium phosphate in bone—either hopper fed or in the mash. (See page 216.)

Pluck Wins for Jesse Stenson

That pluck and grit are real assets in making one's way in the world has been proved again by Jesse Stenson, 19 years old, Minnesota, now a student at the School of Agriculture, University Farm, St. Paul.

JESSE STENSON

For seven years Jesse engaged in boys' and girls' club work but without success in winning honors in local exhibits. Most boys would have given up. Jesse was not built that way.

One day he sat down and took an inventory of the situation. His conclusion was that he would have to have better animals if he hoped to win prizes. He had no money, however, and he knew that he could not obtain it from his father.

He solved this problem by establishing three trap lines for furbearing animals. Throughout the winter he visited his traps daily regardless of the weather, and at the sacrifice of one meal a day. But he got results. His season's trapping netted him $90.

Of this amount he invested $65 in a calf and two pigs. The remaining $25 he reserved for feed and supplies. At the county fair he won prizes with one of his pigs and his calf. This entitled him to a place among junior exhibitors at the State Fair and at the Junior Live Stock Show. Because of his industry and the showing made with his animals and in school work, he was awarded a $75 Caleb Dorr scholarship in the School of Agriculture. From sales, prize money, and scholarship his returns amounted to about $350.

With all the efforts necessary to make such a good showing Jesse found time to serve as a club leader, directing a club of 35 members who made creditable showings at their local fairs, and also to serve as a patrol leader for a Boy Scout troop of 13 members. Having gotten into his stride he intends to engage in junior club work for another two years.

Calf Feeding Questions

HOARD'S DAIRYMAN JUNIORS:—I have a few questions I would like to ask. How long should a calf nurse a cow? How much and at what age should a calf get linseed meal? Would it be best to keep calves in green pastures and feed them grain all summer, or keep them inside? What will make calves fat in their stomachs? I always thought water would do it. Is flour boiled with water and then mixed in milk good for calves or not, and why?

Connecticut. S. S.

A calf should nurse its mother at least for its first two or three feedings. It is important that the calf get the colostrum milk which is the first milk after calving. The calf can be taught to drink of its own accord almost at once after this. It is just as well to feed it milk from its own mother for the first four days because the milk is not fit for human consumption during that period. It is always best to underfeed rather than overfeed growing calves. Start in

You and Dad and Mother will all enjoy reading

"The Life of W. D. Hoard"

By GEO. W RANKIN

YOU will enjoy it because it tells, in a very interesting way, the story of what farm life was like when grandpa and grandma were your age. It tells about Mr. Hoard driving many miles to hear the Lincoln-Douglas debates. It tells about his experiences as a soldier in the Civil War. It tells how he happened to be so much interested in dairying and how he became a leader in the dairy world. It shows what a boy can do for himself and his country, by having one aim in life—and sticking to it.

Your parents will enjoy it because it will take them back to the days when they were young, and because Mr. Hoard's life proved that it is never too late to start making good.

You will all enjoy it because it will help you to better understand each other and to understand the dairy farming business.

Mention Hoard's Dairyman to Your Dealer — It Helps Us

with feeding milk in small quantities, say two pounds three times a day, gradually increasing this amount as the heifer grows older until it is receiving ten to fifteen pounds of skimmilk a day. The calf should receive whole milk for the first three or four weeks, then take a week or ten days to change from whole milk to skimmilk.

When you begin to feed your calf skimmilk you can start feeding it some linseed meal. At first put a half teaspoonful of linseed meal into the milk fed twice a day. This can be gradually increased until at the age of four months the calf is receiving a tablespoonful of linseed meal twice a day in its milk, or linseed meal can be fed with the grain mixture when the calf gets a little older. A good grain mixture is 30 parts ground corn, 30 parts ground oats, 30 parts bran, and 10 parts linseed oil meal. Calves under five months of age should receive whole grains instead of ground. After they reach five months of age, however, the grain should be ground.

Young calves under eight months of age will do best if kept in the barn during the summer and fed milk, grain, and legume hay; and perhaps some silage.

Drinking an excessive amount of cold water may cause a calf to bloat or swell up in the stomach, as you have described it. In feeding skimmilk care should be exercised that the froth is taken off before feeding. It has been found that this froth may cause bloat and digestive disturbances.

The calf should have plenty of water to drink at all times, preferably from a drinking cup if such is available.

While flour boiled with water and mixed in the milk adds carbohydrates to the feed, we consider it unnecessary labor as these same carbohydrates can be secured through feeding whole corn.

Junior Letters

A Poem, "Hoard's Dairyman"

Hoard's Dairyman Juniors:—I am sending another poem to be published in the Hoard's Dairyman. It is called "The Hoard's Dairyman:"

Roses are red, violets are blue,
But the thing I love best
Is Hoard's Dairyman,
Don't you?

I always think the cover of
Hoard's Dairyman is like a door,
Which opens into someone's house
Where I've not been before.

When I find a house that's dull
I do not often stay,
But if I find Hoard's Dairyman,
I'm apt to spend the day.

I never know what sort of news
Will be within, you see,
And that's just why Hoard's Dairyman
Is so interesting to me.

Maryland. Elsie Louise Singer.

A Grown-Up Junior Writes

Hoard's Dairyman Juniors:—I've been a silent reader of your page for a long time and enjoyed your merry circle.

Ever since I was a small lad I have had a calf, poultry, or garden of my very own but I'm sorry to say, dear folks, that I never had the opportunity to compete with other boys and girls as there was no club work in Kewaunee County those days. During the long winter months I would read different bulletins on my chosen project and try to learn all I could about it. The work is so fascinating that one learns to love it and I can recall those summer evenings when I used to hoe in my little garden and dream of the future and wondered what it had in store for me.

I am now connected with the State Bank of Kewaunee as a farm service man, but I still ride home and sit under that old brindle cow, when the roads are passable. The farm is only too dear to me. We are going to carry on a bacon hog project of the Yorkshire type. About 40 enthusiastic boys and girls will receive a bred gilt this winter. Next spring and summer they will have a litter of little pigs to raise, which are to be marketed in September, in a carload lot, at a premium, for a quality carcass. I want you boys and girls throughout this grand old state of Wisconsin to write to me and tell me about your experience in pig club work. My address is Kewaunee, Wis.

In closing I want to advise farm boys and girls to get into club work this year. It will be the happiest season in your young lives.

Edward J. Marek.

Raising Calves

Hoard's Dairyman Juniors:—This summer my brother and I raised a calf for veal. We bought the milk from Daddy for $1.75 per hundred. In a month or so we sold the calf to a butcher for 13 cents a pound. We received $13.39. We paid Daddy his money and then had some left over. We bought a few things and put the rest in the bank.

This fall we have another calf. We feed 8 lbs. of good milk and 19 lbs. of skimmilk per day. This calf is a Holstein and the other was a Jersey.

Hoping to hear from some of you juniors soon, my address is R. F. D. 5, Rice Lake, Wisconsin. Alice Rauchenstein.

"The Storm"

Hoard's Dairyman Juniors:—I am sixteen years of age and in my third year of high school. My father is a farmer and I help him in my spare time. I live three miles from town. I drive a car to school now so it makes it easier than walking.

I own one cow and two heifers myself. One is a registered Jersey and the other two are mixed breeds, but I am going to have all registered stock. Last summer I sold one cow for $125. This is a nice sum to put in the bank for future use. My brother and I own a small flock of sheep together. We have eleven sheep now.

Here is a poem I wrote:

The lightning flashed; the thunder roared;
The wind blew at a rapid gale;
The rain spattered as from the sky it poured;
Leaves were shattered by the hail.

Fruit lay scattered upon the ground;
Animals were seeking shelter from the rain;
Trees were blown upside down;
Buildings squeaked from the terrific strain.

The storm was past; all was still;
Insects were busily working around;
Cattle were hastily grazing upon the hill;
For fear another storm was in that direction bound.

My address is Lyons, N. Y.

Harold Spies.

Good Garden Suggestions

Hoard's Dairyman Juniors:—As you do not know me I will describe myself. I am 5 ft. 4 in. tall, weigh 109 lbs., and am 12 years old. I am in the 8th grade. My birthday is the 17th of July.

My father gave my sister and me each a young cow. As I was the youngest I got the youngest of the cows. No one could milk my heifer except my father. Then my heifer was sold. I selected another cow from our herd. Her name was Blossom. Last year Blossom raised a steer. I named it Happy Go Lucky. This year I sold it and it brought a little over thirty dollars.

This year Blossom raised another steer. I named it Buddy. I fed it new milk and then changed to half new milk and half skimmilk. Then finally I gave it all skimmilk. It is growing to be a very large calf. It is exactly like its mother. It is all red. This year our community organized a poultry club. I joined but withdrew again. I sent for some wire netting but it did not get here so gave up the idea.

I raised a garden, also. In it I raised sweet corn, carrots, parsnips, cucumbers, peas, beans (including limas and navies), and beets. It was down by my father's corn field, and when he cultivated his corn he also cultivated my garden. Between times I kept the weeds out and loosened up the dirt so it would not crack.

If any of the juniors wish to write to me my address is Sansarc, So. Dak.

Helen Lucile Burns.

A Young Jersey Breeder

Hoard's Dairyman Juniors:—I am especially interested in Jersey cattle and am a member of the La Grange County Calf Club, a club of 17 members. I had the highest junior heifer, by name, "Tycoon's Jewel's Opal." This heifer is a double cross of "Golden Tycoon" and also double cross of "Plymouth Ladie," both being prominent Indiana Jerseys.

Opal was fresh October 9 while I was at the National Dairy Show in Detroit. She gives 22 lbs. a day (she is getting no grain) and tests 5.5. As for size she is in good flesh and weighs only 700 lbs. It is characteristic of the line; her mother is still smaller, is a high producer, and tests 6.3.

I am running a project of five cows in school, all of them producing over 400 lbs. fat last year. I am a Senior this year and am carrying the project on with the heifer and the offspring of last year.

I hope other members will write to me and I'll try to answer them. I am 16 years old and stand for pure-breds.

My address is La Grange, Ind.

Charles M. Old

MILK STOOL PHILOSOPHY

J. J. SPRENGER, MINNESOTA

MY intelligent concern can only be for the future because I cannot change the past and en the present was planned when it s in the future. But I can keep ts concern intelligent only by the st careful study of the past. The unger I am the more the future a have in store for me if I am will- and fit to do my part.

While observing a large class of ys who were being trained in a y practical way how to make ngs with their hands in an up-to- e manual training room, I told m they were at a great advantage er us older folks because those ngs were not taught in school en we were young and that be- se of that fact I felt that we were n thirty years too soon. To which e of the boys answered that they ked about this very thing and had decided that they were at a disadvantage because there is no more cheap land and all the other walks of life are so crowded, and they were certain they were born just thirty years too late.

I believe, however, that both of us were expecting too much from conditions because we find it much pleasanter to blame our working condition than ourselves in case of failure.

But just what is our part as parents when it comes to giving society some one to take our places and in what way could we do something to prevent the financial shipwrecks about us?

A story is told of the elder Rothchild, that when he registered for a room he asked the clerk just what the room would cost him. Soon after this his son also registered and when the clerk asked him what price room he wished he replied, rather impatiently, "I should think you would know that price cuts no figure with me." When the father was asked to explain this difference he answered, "Why, you see my father was a very poor man and my son's father is a very rich man and that makes all the difference in the world." I believe he touched a phase of our job in life of which we might as well be thinking during the next few milking periods. If our children need to learn one thing more than any other it is the fact that money does not grow on trees and the only way we can teach it to them is to have reverses ourselves and what is more, to act like men when we have them.

All of the land must of necessity change owners at least once each generation, and new owners will get land in one of two ways; either it is given to them or they must go in debt for it. It is a sad fact that our boys are more liable to lose it if it has been given to them than if they are compelled to go in debt for it. The saddest part of it all is that failure in either case brings with it so much real heartache and discouragement. Personally, I believe at least three things should be heeded:

First, we should teach and practice economy, not only because we wish to save money but because we should save people as well.

Second, we should remember that any child who becomes heir to property but has not learned to get down to work, will lose it. The child who has really learned to work will not really need it.

Third, since we have such a long turnover as farmers, making it necessary for beginners to live a long time before they can realize on their work, the need of economy and better stewardship needs to be made more important to our children. The most comfortable place of all in which to live is just within our income.

Another 1,000-lb. Fat Producer

Another Holstein cow in the University of Nebraska, North Platte Substation, herd has finished an unusually good year record. N. P. Gerben Re-Becky produced 27,110.2 lbs. milk containing 1,006 lbs. fat (1,258.3 lbs. butter) in 365 days at the age of six and one-half years. As a 2-year-old she made a year record of 485.6 lbs. fat; she produced 676.8 lbs. fat as a 3-year-old and 769.2 lbs. as a 4-year-old. This cow was bred and developed in the herd where she is now owned.

We GUARANTEE Red Strand "Galvannealed" Square Deal Fence to outlast any Farm Fence you've ever owned!
KEYSTONE STEEL & WIRE CO.

An extra heavy zinc coating protects Red Strand fence against rust for many years longer than the regular "Galvanizing" process. More copper in the steel fights rust, too. These together—heavier ZINC and more COPPER—form a longer lasting, rust resisting combination never used before in any farm fence.

The Triple Life Wire
Galvannealed
Square Deal Fence

is made from the same kind of wire "that grandfather used to buy" 40 years ago. It has full gauge, crimped, springy line wires; one-piece, picket-like stays; self-draining, can't slip knot. Easy to erect, trim, strong.

Ask your dealer for prices. Red Strand costs no more than any good, woven wire fencing.

Fence For Better Farming

WHEN you haul away corn, wheat, cotton and such crops you pay high marketing costs and reduce the fertility of your land. But by feeding your grain *on the farm* and selling hogs, cattle, sheep, poultry, eggs, wool and dairy products you get good prices, have low marketing costs, buy less food and increase the fertility of your soil.

SuperZinc-ed REG. TRADE MARK

Pittsburgh Perfect and Columbia Fences

meet the first requirement for modern, diversified farming. They make and keep your fields hog-tight so you can rotate crops, grow live stock and pasture fields most profitably. Super-Zinced fences include the Columbia Hinge-Joint and Pittsburgh Perfect Stiff-Stay brands, both of which have proved their merits in the tests of severe service.

Super-Zinced Fences are guaranteed unexcelled in quality and durability. They are made of our own special formula steel and armored against rust by an extra heavy coating of zinc, so closely bonded to the special steel that it will not crack or peel. Styles for every farm, poultry, garden and lawn need. Our brand on fence, barbed wire, gates, steel posts and wire nails is your assurance of uniform quality and durability. Write for catalog and the new farmers' vest pocket booklet "Farm Records," FREE.

A WONDERFUL SUCCESS

"Nothing succeeds like success," they say, but where success is constant and increasing there must be some unusual merit back of it. The continued success of the **Auto-Oiled Aermotor** is based entirely on merit. It has been made better and better year after year. Improvements have been added as experience has shown the way. The **Auto-Oiled Aermotor** of today is a wonderfully durable and efficient windmill.

The Aermotor Company, more than 12 years ago, solved the problem of complete self-oiling for windmills in such a way as to make the system absolutely reliable. The oil circulates to every bearing and returns to the reservoir with never a failure. There are no delicate parts to get out of order. The double gears run in oil in a tightly enclosed gear case.

BETTER COWS FROM BETTER SIRES

THE record of the dam of any sire is a promise, but the records of a large number of high producing daughters are the fulfillment of that promise."

At what point in the production of pure-bred cows will the average pure-bred bull fail to increase the production of his daughters over their dams; what point with grade cows? How much variation is there among pure-bred bulls when the production of their daughters is compared? How much is an outstanding, proved, prepotent dairy sire worth? How much damage can a poor sire do when used in a herd of good cows?

Some work done by the Bureau of Dairy Industry in a study of cow testing records comparing the production of dams with their daughters raises the above questions and supplies interesting data contributing to their answer. The data are reported in Department Circular 368 entitled, "Better Cows from Better Sires." A brief review of some of the more important findings should interest our readers.

This study includes 2,182 yearly production records of dams and their daughters from various cow testing associations. The records are of comparatively recent date, nearly all of them having been made within the association years ending in 1922 to 1925. In all cases the records of immature dams and of immature daughters were figured to maturity by the method in common use of dividing the production of the 2-year-olds by 70, the 3-year-olds by 80, the 4-year-olds by 90, and in each case multiplying by 100.

When both pure-bred and grade cows are considered together including 2,182 records, the daughters excelled their dams by 377 lbs. milk and 19 lbs. fat. This does not seem like a big increase but when it is known that the dams averaged 8,635 lbs. milk and 342 lbs. fat, it shows a very good general improvement to the credit of the better pure-bred sires.

Where the daughters of grade dams were considered separately, it was found that the dams averaged 8,181 lbs. milk and 326 lbs. fat, whereas their daughters averaged 8,608 lbs. milk and 344 lbs. fat, a gain of 427 lbs. milk and 18 lbs. fat.

Where the daughters of pure-bred dams were considered separately, it was found that the dams averaged 9,031 lbs. milk and 356 lbs. fat, whereas their daughters averaged 9,364 lbs. milk and 376 lbs. fat, a gain of 333 lbs. milk and 20 lbs. fat.

The daughters of pure-bred dams averaged 9,364 lbs. milk and 376 lbs. fat. The daughters of grade dams averaged 8,608 lbs. milk and 344 lbs. fat, or a difference of 756 lbs. milk and 32 lbs. fat in favor of the daughters of pure-bred dams. This would seem to indicate the use of better bulls in the pure-bred herds.

When the grade and pure-bred dams were considered together in production groups ranging from 76—125 lbs. production to 626—675 lbs., each group increasing by 50 lbs. fat, and the production of the daughters of these groups compared with their dams, it was found that when the average production of the dams reached 384 lbs. fat, thereafter there was a decrease in the production of the daughters over their dams. This means that the owners of high producing herds must keep sires that are highly prepotent in transmitting production to their daughters if the level of the herd is to be kept up or increased.

Among the pure-breds when the production of the dams reached 394 lbs. fat, thereafter the production of the daughters was less than their dams. For grades this figure is 349 lbs. fat. These figures simply mean that where one has pure-bred cows that average 394 lbs. fat, he must have a pure-bred sire that is considerably better than the average pure-bred sire; and where one has a grade herd of cows averaging 349 lbs. fat, he must likewise give considerable attention to selecting a sire or in both cases the level of herd production will be reduced.

A comparison was made of the production of the daughters of 58 pure-bred bulls in cow testing associations with the production of the dams. No sire was considered unless records were available on 5 or more of his daughters and their dams. Forty-two of these sires increased the butterfat production of their daughters over the production of the dams whereas 16 showed a decreased average. Arranging the sires in order of number of pounds fat their daughters increased over the dams; from the highest to the lowest it was found that the daughters of Sire No. 1 increased by 239 lbs. over their dams; daughters of Sire No. 20 increased by 53 lbs.; daughters of Sire No. 40 increased by only 11 lbs.; and daughters of Sire No. 58 decreased to 209 lbs. below the average of their dams. For direct comparison the data for Sire No. 2, No. 30, and No. 58 are given in table form.

In the case of Sire No. 2 every one of the five daughters produced more than their dams. With Sire No. 30 four of the twelve daughters produced less than their dams but even so when it is considered that the 12 dams averaged 11,871 lbs. milk and 414 lbs. fat, the sire's records were very good. Sire No. 58 decreased the production of every one of his 10 daughters below the production of their dams.

On the basis of these figures, 50 daughters of Sire No. 2 would, in one year, produce 11,850 lbs. fat more than their dams which at 50 cents a pound makes a value of $5,925. Fifty daughters of Sire No. 58 would, in one year, produce 10,450 lbs. fat less than their dams, which at 50 cents a pound means a loss of $5,225 for having used so poor a sire.

Facts like these impress upon us the important things to be done concerning the future improvement of our herds. The importance of selecting a sire, whether he is to be mated with grade cows or with pure-breds, is clearly demonstrated. The economic importance of some system of selective registration coupled with production records is clearly indicated in the data presented in this study.

"The record of the dam of any dairy sire is a promise, but the records of a large number of high producing daughters are the fulfillment of that promise."

A Co-operative Cream Station

E. B. DARLINGTON, IDAHO

A CO-OPERATIVE organization which promises to have an important influence in the economic life of the community was established recently on the Minidoka project, in Southern Idaho. The new venture is a cream pool which is being operated by the Mini-Cassia Dairymen's Association.

The movement toward co-operation among local dairymen started about four years ago, but it was during the sessions of a dairy school held at the village of Declo last January that it crystallized into activity as a live organization determined to enter the business field. On June 7 a receiving station was opened and a program of collecting cream was inaugurated.

The objects of the association are to establish a more direct relationship between the producers of cream and the consumers of butter, to reduce overhead charges in manufacture, and to obtain for the membership any advantages that the market may afford. It is believed by the members that they will be able, through handling of the cream on their own account and the sale of butter through their marketing organization, to secure to themselves the profits on butterfat that have been going to outside concerns.

Headquarters of the pool are at Burley. From this central point trucks are sent out to collect cream from the farmers and it is all brought into the station for testing, cooling, grading, and preparation for shipment to the creamery at Jerome, about 30 miles away, where for several years a co-operative establishment has been operated. The cream collected and prepared locally is sent by truck daily to the Jerome creamery, the product of a collecting station at Eden being picked up en route. There are six collection routes out of Burley, with three trucks covering the territory.

The plan adopted by the association is to have the truck drivers call for separated cream on half the patrons each day, so that all members will have an opportunity to forward their product every other day, including Sundays during hot weather. Payment for the cream is made upon the next visit following the delivery or at the headquarters station, on an advance price basis determined upon the existing market and the outlook. Adjustments in price are made monthly, according to actual receipts for butterfat by the association. A premium of 3 cents per pound of butterfat is paid for sweet cream and the farmers are urged to keep it sweet for the maintenance of high butter standards. Butter is sold at sour cream prices to the farmers who are shipping, or 3 cents off the sweet cream price.

On June 15 more than 1,600 cows were signed up for the pool but not all of them were contributing on account of delays encountered in making final arrangements. Hay harvest was on and it has been impossible for all members to establish themselves immediately upon the new basis, requiring additional equipment in the way of separators, containers, etc. However, the average daily shipment to the Jerome creamery for the first month of operation is estimated to be from 800 to 1,000 pounds and it is believed that by the end of the summer the output of the Burley station will be at least 30,000 pounds of butterfat per month.

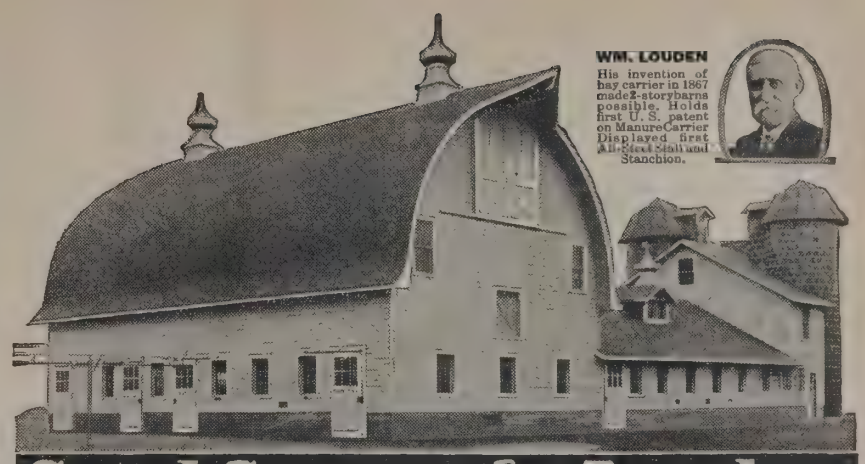
The membership in the Mini-Cassia Association now numbers about 260 dairymen. A development in the next few months to about 350 members, with upwards of 2,000 cows contributing, is expected by the officers and directors of the pool.

The arrangement by which the new organization has its product manufactured into butter at the Jerome Co-operative Creamery and marketed from there is considered advantageous from the standpoint of both the dairymen and the creamery administration. The association has taken a single share in the Jerome Co-operative, and is accorded exactly the same treatment as if each individual member were a shareholder. The creamery pays the cost of collecting, testing, cooling, grading, and hauling the cream, and the salary of the manager of the Burley station on the theory that the largely increased volume from this locality reduces the unit overhead cost. It is planned to operate the Jerome creamery at night to handle the additional input. The Jerome establishment already produces 175,000 pounds of butter per month and has the second largest volume of any creamery in the state.

The butter from the Jerome creamery, including that manufactured for the Mini-Cassia Association, is marketed through the Challenge Butter Association of Los Angeles, which is owned by 15 co-operative creamery associations and absorbs practically the entire product of all of them. Because of the high standards maintained by this marketing organization and required of its contributors, it is able to obtain a price for sweet cream butter several cents in advance of the general market in Southern California.

By handling the large volume through the Jerome creamery, partially supplied by Minidoka project dairymen, it will be feasible, according to local officials, to reduce the proportion of overhead costs so that the cream producers can be paid at least 2 cents per pound more for butterfat than the market price of butter at Los Angeles. This is possible because of the overrun in finished butter weight as compared with the poundage of butterfat.

A great deal of the milk from project dairy herds has been going to the cheese factories, there being five of these institutions in the community. Four of them are owned by the Laab interests and one is a co-operative plant.



DELIVERY TRUCK AND DAIRY BARN OF HENRY E. SCHROEDER, MINNESOTA

Trailing Holsteins to South America

(Continued from page 239)

am convinced that they, too, have their troubles.

We are anchored before Topocilla tonight, immediately under the brow of mountains with lofty, snowless peaks. This town is small and acts in the capacity of a way-station for mines in the interior. Rain is as unknown here as diamond mines round Chillyville, Wis. Trains have to ascend thousands of feet to cross over the Andes. There is one on its way now, and it looks like an ant crawling upward, circling curves, spanning trestles, and disappearing finally in a tunnel as a mouse in a hole.

January 24. Did the morning chores in jig time, then two of the

RISSO'S FRIBOURG BULL, CHAMPION AT BUENOS AIRES SHOW

assistants and I hired a dusky Chilean to row us ashore for two pesos each. Being warm and thirsty, we repaired directly to the leading hotel of the town, and there we sat at table and consumed two bottles of cool beer each, and conversed and soon it was noon. Then we partook of their Sunday dinner which is much different than ours. But we were hungry and it tasted good, and, above all, it was a change. A shift from oxtails and kidney saute is a change.

After dinner we ascended a trail 1,000 feet and gave up. We had intended to climb 5,000 feet, but obstacles like heat, too much dinner, and a late attack of ennui were insuperable. We were combing the beach for a secluded place to swim in without bathing suits, when a carbinero appeared from nobody knew where and put a stop to our innocent pastime. It was not necessary that we swim anyway.

January 26. We steamed 110 miles during the night and at 6 a. m. were in Antofagasta. Everything started off with a bang this morning. The stevies came aboard in droves, the checkies got a breakfast of oatmeal and kidneys in the galley, the winches began whining—they needed oil—the booms moaned, and voices were pregnant with the stir to do labor.

January 27. This was a beautiful day. The sun is very ambitious in northern Chile, and neglects nobody. The stevies are unloading structural steel in front of the cattle and the winches screeching and the steam exuding from their pores—worn fittings—are a nerve-racker.

Antofagasta is a town of 40,000 people, although it does not look it. There is sea in front and mountains in rear, a cemetery with acres of white slabs on the mountainside—an evidence that the town is not a stripling—a plaza with flowers and shrubbery, a brewery on the waterfront, and a breakwater under construction. These are the outstanding features as seen from the harbor.

January 28—Another nice day, and very warm. The sun never neglects the people in Antofagasta nor the sorrel-topped peaks that hem them in. Work in the hatches, in front of the cattle, is finished.

I watched Wong and Wing eat their supper. It is an all-rice proposition, but one that looked enticing just the same. These Chinamen certainly know how to cook rice. I inquired of Wong regarding the secret for its preparation, and he replies: "All light, no!" "Sure," says I. "Fine." And was prodigal with nods and smiles. But Wong is just a human being; he likes flattery in varying amounts, and when he doesn't want to savee, he has a peculiar way of feining no-savee, too.

January 29. We took on a stock of fresh water today which costs $5 per ton, and is delivered in tugs.

I bought a Spanish grammar and have been doing some translating on my own hook. I find such startling information as this to remark: Don Quixote owned all the windmills in Spain; that the senoritas in Barcelona are pale eyed and black skinned; and that the king of Spain held up two robbers one dark night and took all their money from them. Spanish is more complicated than it appears.

At present our latitude is 23 degrees south of the Equator; we are within 30 mathematical minutes of the Tropic of Capricorn. This is South America's summertime, hot days and cool nights in Chile, and plain overhead at night are the Centaurs, the Southern Cross, the belt of Orion, and a thousand and one other constellations.

January 30. We almost sailed this A. M. without Lindy—almost. Steam was up, the Blue Peter was up, and the old man was up on the bridge with his megaphone. But when the carpenter on the forepeak began to hoist the anchor, the piston in the windlass broke. The Humming Bird had no extra piston, so it has taken all day ashore to get it welded and reinstalled. About 2 P. M. the agent's launch came out to the Humming Bird and on the bow, residing on his haunches and as unconcerned as you please, sat Lindy. He came up the ladder with the customary grace and meow, surveyed everything and everybody, and went aft. Now we know we are going to sail. And sure enough, at 6 P. M., Antofagasta is dipping down the horizon.

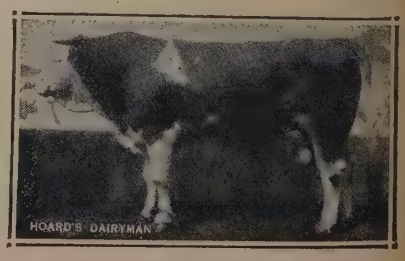
Tonight I traded one of my cherished Roi-Tans for a bowl of Wong's well cooked rice. Rice and milk from a $1,000 cow make a nice dish.

Wong says: "You like lice?"

I say: "Nope, lice I no like. Lice him no good."

Wing: "What to me you say?" I say, "Lice, lice, lice; you eat him plenty last night, lice!"

"Oh, rice. I thought you meant lice. Sure, I crazy for lice. Sure. Sure."



Wong lit his cigar and laughed good. "I catch him, tonight, big pan for you. Good? All light?"

"Fine, fine," says I. "You one fine cook, Wong."

As stated before, Wong appreciates flattery when doled discreetly.

A rich honey-colored moon, lopsided and low, hangs for the time being among the peaks of the Andes. A heavy sea is running, a sullen, unfriendly sea, and one that rocks the Humming Bird like a cradle.

January 31. Steaming down the

A SIMMENTHAL BULL IN PERU

coast of Chile, going from Antofagasta to Chanaral. Chile should have first prize for longest coast. A tremendous swell, arriving from a storm off Cape Horn, made the Humming Bird list awkward all day, and at times far over.

An hour before noon the quartermaster began to point the bow toward a little concavity in the coast line on the port quarter; but it was fully an hour later before Chanaral could be detected. Some copper concern from the States is developing a mine one hundred miles inland, and Chanaral is to become the loading port. Along the shore was a four-master, a storm victim, lying on its side and full of worthless cargo.

Wong says, looking at it, "Go shore, no? No good ship now. Ship sleep too much." Then he says, 'Lice, tonight; no good?"

"Sure, betchem boots, good. Plenty ice."

Then Wong says, "You good Chinaman. You lev Hong Kong. Plenty ice, Hong Kong."

"No," says I, "no liky Hong Kong. Much rat. No much money."

"Aw," he says, "you no good. Rat young, good. Chop suey, fine." Then he laughed good. Wong is quite a fellow.

February 1. Evening. The day is done, and a huge bowl of rice also. There is a cloud bank in the South, the first to be seen since leaving the Equator. A gentle breeze is sifting past the Humming Bird; the night is cool, balmy, and pleasant. An engineer has a phonograph and on the bunker-hatch entertains with it, and most of the crew is lying around the deck like a lot of useless refuse, listening, drinking in melody, some sleeping, others dreaming, but all tired when night comes because all hands have to work. The number of records is limited, but we enjoy them just the same. They are a diversion from the monotony of work and routine, change the course of thought, purge the mind almost like rinsing out a used vessel before putting it away for the night.

(EDITOR'S NOTE: This is the fifth of a series of six articles by Mr. Beattie. The next will appear in an early issue).

Joe Guesser is Converted—A Dairy Play

(Continued from page 236)

Joe: "That's all right for Bill, he has money."

Boaz: "Jack says they averaged $150 clear on each cow last year. Jack's club heifer milked 8,700 lbs. her first year's milking."

Joe: "What happened at the last calf meeting at the school house?"

Boaz: "The dairy specialist told us how farmers benefit by either keeping their own records or by joining a cow testing association. He said that only three of eight men who joined the cow testing association in Monmouth County guessed their best and poorest cows before the tester started work there."

Joe: "Son, the next time you start to any of those meetings you'll find yourself going back home. Do you think I believe all that stuff the dairy specialist told?" (Katrinka enters romping.)

Katrinka: "Seems to me that a woman oughtn't to have to cut her own wood on wash days. Here I am washing with no wood and the fire's out. I tried to cut some with that broken axe handle and it flew and hit my foot. There's not a thing in the house for on it, either."

Joe: "I don't see how you burn so much wood. I brought in a milk bucket full just this morning."

Boaz: "Bookkeepers get their wood sawed with a little engine. They can saw enough wood in two hours to last all winter. I spent that much time choppin' Sunday morning before Sunday School time."

Katrinka: "Don't talk so loud; here comes Bill and his son, Jack."

Bill: "Good morning, the whole Guesser family."

Joe: "Well, what's on your mind this morning, Bill? What day of the week do you clean your cow stables out?"

Jack: "Since Dad got his track and manure carrier in we clean stables three times a day. It's an easy job, now."

Katrinka: "Mr. Bookkeeper, Joe doesn't believe in anything up-to-date. He's so old fashioned, I guess, that's why we don't make money on our cows."

Bill: "Joe, if you do as I tell you, I'll help you make more money from your cows in the next two years than you have made in any five years before in your life."

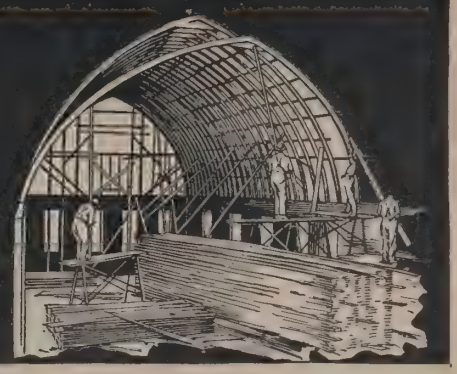
Boaz: "I wanted dad to let me keep a record of what each cow gave."

Bill: "Joe, you must do one or two things. Weigh your own milk and then get the club agent to figure out how much grain each cow should be getting and figure out how much money each cow makes each month; or, better yet, join the cow testing association and pay the tester $4.50 a month to do it for you.

"In either case, don't be afraid to get rid of the poor cows. Then get a pure-bred sire and raise the calves from only the best cows. Set a standard of, say, 7,000 lbs. the first year, 8,000 the second, and so on, until you reach 10,000 lbs. as an average cow record for the year. Last year our cows averaged 10,620 lbs. each. Then, Joe, you get your cows T. B. tested, clean up a bit around the barn, and you'll soon be getting more money for your milk and there will be a demand for your calves."

Katrinka: "Keep right after him, Bill, until he decides to be a business dairyman even though it takes all day. I'll go in and get some things for dinner in case you have to stay that long."

Bill: "Then, Joe, get started to mixing in a few pure-breds; get Boaz to purchase a heifer through the calf club. Next, get one of these farm account books from the county agent. They are free and he will help you to start it. Jack keeps mine for me as my secretary. Boaz is in Jack's class at school. Get Boaz to be your secretary. We farmers have got to get more business in our farming nowdays. Do you have a pencil, Joe?"



Joe: "No. Come into the house. I'm sort of getting interested in this."

Boaz to Jack all tickled: "Then it

A Hog House, Dairy Barn
Horse Barn or Poultry
House Until You Get
Our Free Book

TELLS WHY Jamesway COSTS LESS
and Saves Costly Mistakes

Labor Saving Dairy Barns

If you are thinking of building, remodeling or ventilating a cow or horse barn, hog or poultry house, or if you are considering the purchase of labor and time-saving equipment for such buildings, by all means, fill out coupon in this advertisement and let us send you free our valuable Jamesway book.

This book will show you how you can save money and have your buildings planned and equipped so that they are most convenient and practical. If you will avail yourself of Jamesway service, you'll have the same gratifying experience as H. L. Hartly, Manager of Island Farms, Duluth, Minn. Here's what he writes:

"We very much appreciate the splendid architectural service you have rendered us. The ability you showed to adapt plans to meet results desired were a revelation to me. Your suggestions saved me considerable in material and time."

Our many years' experience in planning and designing farm buildings enables us to save you money on materials and construction—show you how every door, window and general arrangement should be to make buildings convenient.

This book also tells you all about Jamesway Equipment—Stalls, Stanchions, Drinking Cups, Litter Carriers, etc., for the cow barn. Troughs, Waterers, etc., for hog houses. Feeders, Nests, Incubators, Brooders for the poultry house—a complete line of every kind of labor-saving, money-making equipment for any farm building. Jamesway Equipment is better and costs less in the long run.

Mail coupon today. Tell us just what you are interested in—whether building, remodeling, ventilating or equipping cow barn, horse barn, hog or poultry house, and we will send you the book that tells you just what you want to know.

Time Saving, Money Making Hog and Poultry Houses

MILKS 18 to 40 COWS an HOUR

Milks 2 to 4 cows at a time—18 to 40 an hour. Clean, convenient, easy to use. Recommended and used by leading dairymen and farmers because it milks just like the human hand. Easy on the cows—many report enough increased milk yield to easily pay for it in a short time.

$35 Puts it Milking for you.

Comes Complete with ENGINE or electric MOTOR

No Installation Expense
Ready to start soon as uncrated. Comes complete with 2 HP engine or electric motor. No extras to buy—no installation cost—no pipes. Saves time and will easily do the work of 4 milk hands.

30 DAYS TRIAL—Any responsible farmer or dairyman is welcome to an absolute 30 day trial. You must be satisfied or no sale and your money promptly refunded. Guaranteed for 10 years. The Ottawa will not only save you a big part of your purchase price but may be paid for out of milk sales if desired.

FREE—Our book "The Truth About Milkers" tells you all about it—illustrated—answers every question. Write—a post card will do. Free—all charges prepaid.

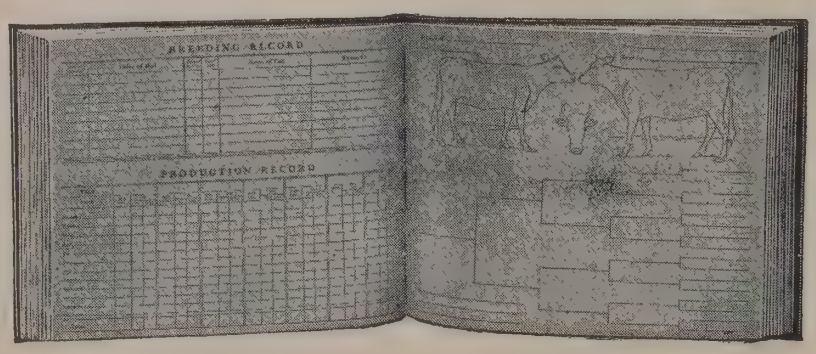
For Breeders of Purebred Dairy Cattle



The Hoard's Dairyman Breeders' Record Book is getting more popular every day among breeders who want a neat, handy, handsome book in which to keep

permanent records of their cows. Many breeders tell us they are as proud of their book as they are of their cows—and for a dyed-in-the-wool cow man, that's "going some".

It IS handsome—and practical. We are proud of it. We would like to sell one to every breeder in the country.

It consists of 96 pages, nicely bound in a high quality cloth cover. Each page numbered, and an index in the front of the book. No delay in finding what you want.

Each page has space for—

A SKETCH OF THE COW
FIVE GENERATION PEDIGREE
PRODUCTION RECORD BY MONTHS FOR SEVEN YEARS
BREEDING RECORD

PRICE $2.50 Postage Prepaid

NOTE

We will be glad to forward you this book without charge if you will get just three of your neighbors to give you $1.00 each for a three years subscription. If you find Hoard's Dairyman helpful, why not tell your neighbor about it.

HOARD'S DAIRYMAN FT. ATKINSON WISCONSIN

DAIRY MARKET NEWS

Twin City January Milk

The Twin City Milk Producers' Association paid $2.48 a hundred for 3.5% milk delivered in St. Paul during January. The association handled 25,476,860 lbs. milk, of which 50% was surplus.

Cream patrons were paid 56 cents a pound for butterfat in first grade cream during January. This is 6.8 cents above the average price of 92-score butter on the New York market.

February Milk Prices

(From Report by U. S. Dept. of Agr.)

Table I represents a comparison of the net prices received by producers in 111 local markets, for fluid milk (test 3.5%) f. o. b. local shipping point or distributors' country plant:

Table I—January Producers' Prices by Geographic Sections.

Sections	Range of prices per cwt.	Comparison of average prices 1927 Feb.	1927 Jan.	1926 Feb.

* 12 oz. Package. † 18 to 25% fat.

Butter markets in February held steady at rising prices, the advance being from 49.5 cents on the first to 53 cents on the 23rd. The average for the month will be approximately seven cents above February of last year and eleven cents above two years ago.

ebruary Butter and Cheese

February butter on the New York market vanced from 49.5 cents on the first of the nth to 53 cents on the 23rd, averaging 51.5 its for this period. This is two cents above January average, 6.6 cents above Febru- a year ago, and 10.7 cents above Febru- , 1925. These prices have prevailed despite fear of traders that consumers would not e butter at the increased price and that oduction was bound to increase. The cur- it weekly report of the government says: large percentage of the trade sees little spect of any sharp price recession during coming few weeks unless consumptive out- s fall off sharply or the make of butter in- ases rapidly, and only here and there does e find an operator who will make such edictions."

Storage withdrawals have continued and ere is a shortage of this class of butter. oduction reports are irregular, but there is manifest tendency towards an increase. e weekly reports for February 12, in fact, ow a falling off in production as compared th last year. New Zealand butter is coming some quantity, some of it changing hands 52 cents.

Cheese on the Wisconsin boards declined m 25.5 cents on the first of February to cents on the 23rd, the average for this pe- d being 24.5 cents. This is one cent below January average, but is a cent and a half ove the February average of the past two ars.

A Bottle of Milk

The following article was written E. W. Palmer, for The Clevelands, published by the Cleveland, Ohio, hamber of Commerce. We publish is article for two reasons: first, it a good one and, second, it shows at the thinking men of the cities e interested in the welfare of the iry farmer:

A bottle of milk on the back steps -a small thing, a common thing, an expensive thing, an unconsidered ing; and yet, Greater Cleveland ends each year twenty million dol- rs for its milk and ten million more r its butter, cheese, ice cream, and ndensed milk—one-fifth of the od we consume.

An almost perfect food—balanced all the requisites of nutrition—it a vital necessity for babes and in- lids and ideal for the well and rong

An unconsidered thing—but it kes the product of six thousand rms to give Cleveland its daily sup- y; six thousand farmers who with eir assistants must be up at day- ght 365 days in the year, regardless weather, and who after milking ust traverse roads, no matter what ndition, to bring it to the platform om which it is taken by train or by uck to the depot or dairyman in leveland, to be pasteurized, bottled, d delivered quickly to the homes or e stores of our city.

And the detail of all this! The re at the farm to have everything nform to the city's health require- ents, the cooling and storage until starts for the platform, the cover- g on the trucks in summer to keep wn the temperature on its journey the city, the testing at the dairy r butterfat content, the standard- ing, pasteurizing, cleaning of bot- es, filling, delivery, selling, routing, redits, bookkeeping, and collections; l this and much more, to enable a illion people to have their daily ilk and cream supply.

The city, state, and federal health epartments must be given due rec- gnition for the debt that we owe em.

Not always was our milk supply ean, safe, and wholesome. Not far ack are the days when milk came om uninspected farms and was de- vered at the door without cooling, asteurizing, bottling, or care as to s origin or its bacteria content. requently epidemics of contagious isease came because of contami- ation in some farm community. esting of herds for tuberculosis has become common only in the past few years and the work is still going on.

Cities Go Further

State and federal veterinarians working from our state capital have done much by research, education, and persuasion to bring about advanced legislation, supervision, inspection, and co-operation. Working with community centers and with farm associations, much has been done to promote sanitation, cleanliness, and advanced methods of milking and handling of milk.

But the cities go much further. Backed by both city and state enactments, they begin with inspection at the farm of each shipper whose milk can not be brought into the city without a permit, which can be revoked for cause.

There has been passed in Cleveland an ordinance, effective January 1st, requiring that all fluid milk come from tuberculin tested cows.

Arriving in the city, the milk can be rejected for temperature, souring, uncleanliness, or too high a bacteria count.

Inspectors check up constantly on over 200 dairymen, and if conditions are not favorable the health authorities can revoke the dealer's permit, or if necessary have him prosecuted for violation of health laws.

Luckily all this is generally a matter of education and co-operation. Farmers and dealers alike are coming to recognize that the way to create a market and secure a fair price for their product is by giving the public the best possible article and then advertising its merits.

All have worked together to this end with striking success.

Other figures are interesting and important. Ohio has nearly two million dairy cattle, worth probably one hundred and fifty million dollars. When the state is cleared of bovine tuberculosis, it will create a new market for cattle from other states and add close to forty million dollars to the wealth of Ohio farmers.

All this is important to city dwellers. Not only is our health dependent largely on our food supply, but our prosperity is closely linked with that of the farmers.

When at times milk has been sold at prices ruinous to the farmer, the effect has been reflected at once in lower values of farm land and of cattle in reduced buying power, which in turn has affected towns and cities. Prosperity is always threatened when the farmer suffers.

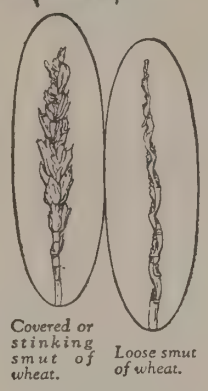
The fertility of our farms is also largely conserved by dairying, and this is a matter of supreme consequence to this and to future generations.

The Cleveland Chamber of Commerce, through its agricultural committee, maintains a sub-committee on milk, believing an industry so important from every standpoint should have all the co-operation that the Chamber of Commerce can give.

To this end it has worked to help bring about better organization of the Milk Producers' Associations, improved systems of handling the seasons of oversupply and shortage, better relations with the distributor, a fairer basis of price to the consumer.

It has worked with the state, city, and county to secure advanced dairy laws and stronger support of the efforts to eradicate disease, to bring about more adequate inspection in city and country, and to develop the industry in every way.

It is a pleasure to state that all parties concerned—producers, distributors, and authorities—are at present working together in a remarkable way and, we believe, are giving Cleveland an excellent milk supply at very reasonable prices.



Smuts

of Wheat, Barley and other Cereal and Forage Crop Diseases

wiped out with

SEMESAN

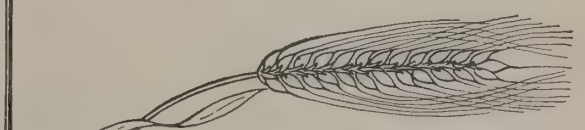
The Organic Mercury Disinfectant for Dust or Liquid Application

Covered or stinking smut of wheat. *Loose smut of wheat.*

EXPERIMENT Stations, Agricultural Colleges and large-acre farmers have found Semesan the most effective, most economical disinfectant for the following diseases:

Smut Diseases—Bunt or stinking smut of wheat; covered smut of barley; stem smuts of rye; flag smut of wheat; loose and grain smut of sorghum; head smut of millet and smut of cheat.

Leaf Diseases—Stripe diseases of barley and glume spot of wheat can be effectively checked. The spot and net blotch of barley have also yielded to treatment with Semesan.



Stem and Root Diseases—Anthracnose of wheat, rye, oats, blue grass, orchard grass and timothy, "take-all" and seedling blight (Fusarium) of wheat; leaf spot of red clover; leaf and pod spot, and brown spot of soybeans; and numerous other diseases may be effectively checked by Semesan seed treatment.

AS long as there's a possibility of a better way of fighting disease there's always a possibility that you're not getting the most out of your acres and your effort. Read what Powell Fullerton of Idaho Falls, Idaho, says about Semesan:

"I found your Semesan treatment for wheat to increase germination and stand decided over formaldehyde treatment on the same ground and under the same conditions. While I did not harvest the two treatments separately, I noticed, when cutting, a much heavier stand on the Semesan side of the field. From this I judge I had an increased yield. I intend to again use Semesan on my wheat and Semesan Bel on my potatoes."

In Delaware, according to the Bureau of Plant Industry, "One grower disinfected his seed with Semesan and reduced covered smut from 22% to 0.5%. One field of spring barley where seed had been treated with Semesan showed only a trace of loose smut while untreated seed showed 1%. Spring barley treated with Semesan showed complete control of stripe while check contained 0.5%. In a field of winter barley treated with the same substance only 1% leaf blotch was found on the lower leaves while 20% was found on the check."

New York Cow Makes Second 1,000-lb. Record

A very good record has just been completed by Canary Posch Netherland, an 11-year-old Holstein cow owned by Yates Farm, New York. In 365 days she produced 30,074.9 lbs. milk, 1,055.3 lbs. fat (1,319.15 lbs. butter). As a 10-year-old she produced 28,166.8 lbs. milk, 1,031.25 lbs. fat in a year. According to the Holstein-Friesian Association of America, she is the eighth cow of the breed to twice produce over 1,000 lbs. fat in a year.

Kiwanis Club Buys Bull

HOARD'S DAIRYMAN:—In order to encourage dairying in its community as well as build up the herds to better grades and higher production, the Kiwanis Club of Fitzgerald, Georgia, will secure a registered Ayrshire bull and present it to the farmers of the community.

It is probable that the animal will be "boarded" out on the farms of responsible and experienced dairymen in the section, each dairyman taking his turn in keeping the bull, and that his services will be given to dairymen free of charge or at a very small cost to cover the expenses of keeping him. And in this way it is predicted that the quality of the dairy herds will be greatly improved within a few years and more milk per animal will be secured.

The example of the Fitzgerald Kiwanis Club is a unique one, but it is one which might be well followed by other civic organizations in the South.

Georgia. J. H. REED.

Absolutely Clean MILK

Gets ALL the Dirt, Dust and Sediment

Dr. Clark's PURITY Strainer, with its sterilized cotton disc clamped to the bottom, is GUARANTEED to strain your milk 100 per cent clean—or your MONEY BACK.

Clean milk gets better grading, brings higher prices. That's why the U.S. Gov't and world's best creameries and condensaries endorse and recommend Purity Strainers. Over 50,000 dairymen and farmers use Purity Strainers daily, because no other strains so easy — so quick—so clean. Also best for straining maple syrup, vinegar, cider and home beverages.

Made in two sizes — 10 qt. and 18 qt. Sold by good dealers everywhere. If your dealer can't supply you — write us for descriptive folder, prices and our "10 Day Trial Test Offer."

[1]

10 Day Trial Test

Write at once for our 10 Day Trial Test Offer. Find out how you can test the PURITY Strainer and get your money back if it doesn't remove every particle of dirt from your milk. Get all the facts. A postal or letter brings you complete information "10 Day Trial Test Offer" by return mail.

They'll Get You That New Car

Notice the farm folks with new cars, radios, light plants and all the rest. They might have waited for Congress to help the farmer. But they helped themselves instead. They figured that a 5% cut in the cost of producing milk and a 10% gain in production would just about double their actual net profits—give them twice the money to enjoy life with.

Star Equipment Lowers Cost and Increases Production

It saves steps, time, feed and labor. It prevents dirt, dampness, waste, accidents and diseases that wipe out profits.

To the cow it means safety, cleanliness, comfort and health—fresh air, light and a fresh drink when she wants it. She can't help giving more milk.

New Star Features

Unit Stall and Curb Clamp save installation expense. Giant Stanchion keeps cows safe. New Rust Shield doubles life of stall.

Send letter, postal or coupon for big 228-page book. Shows Stalls, Pens, Water Bowls, Carriers and everything for the barn.

Corn Borer Threatens the Dairy Industry

(Continued from page 237)

fly as far as twenty miles and lays eggs on the underside of the corn leaves in late June, July, and early August, depending, of course, when the moth evolves from the pupa stage, for each individual moth has but a short life.

The egg hatches in four to six days. The resulting larvae bore their way into the cornstalk, proceed to eat the juicy sap, and continue in the stalk through the remainder of the growing period. From October to May the larvae hibernates in the cornstalk and this is the period in which the borer must be attacked if its spread is to be prevented or total eradication perfected.

Unlike other insects, the borer freely tunnels up and down the cornstalk, weakening it and causing it to break over, while it remains inside the stalk safe from poison sprays and other destructive means developed by scientists. Poisons cannot reach it and only complete destruction of the growing corn can completely annihilate it.

Control Measure Suggested

Granting then, because of its peculiar life habits, that the corn borer is secure from the usual control measures prescribed by entomologists, other measures must be devised.

In the first place we must consider that the United States government, in passing the Purnell bill, has authorized the expenditure of ten million dollars by the Department of Agriculture to combat the European corn borer.

The plans for procedure, according to Secretary of Agriculture Jardine, seem to be a clean-up campaign. Secretary Jardine seems to concur with Dean H. W. Mumford, University of Illinois, who with W. P. Flint, Illinois state entomologist, recommends eight control measures.

Dean Mumford suggests that in the first place farmers adopt soil management practices that will build up the soil and help produce maximum yields of corn on large, healthy stalks.

In the second place, Dean Mumford suggests that the farmers grow earlier maturing varieties of corn that can be planted late and at the same time develop heavier stalks.

A good rotation of crops is suggested, recommending that they provide for the growing of maximum acreages of crops which the borer does not injure and which at the same time help to build up the soil and enable the farmer to handle crop and weed refuse to the best advantage and at low cost.

An important recommendation is that as much of the corn crop as possible be utilized through the silo and as finely shredded material.

A further increase in the acreage of legumes is asked, for they are injured less by the borer than are other crops and are at the same time extremely valuable in all crop rotations.

Clean plowing is urged because a large proportion of the insects can be destroyed if all the crop and weed refuse is entirely covered.

Education and familiarity with quarantine regulations, with co-operation in carrying them out, will help materially to hold the borer in check.

Dean Mumford's final recommendation is one that applies equally well to all corn growing states. "Watch fields for the presence of this insect," he says, "and send suspected specimens either to your state entomologist or to the U. S. Department of Agriculture, Washington, D. C. Specimens should always be sent in sealed tin r ceptacles as no air is necessary.

Co-operation Needed

To save the corn crop of the Unit States, alone worth $325,000,000, a the other branches of agriculture d pendent on the corn crop for foo prompt co-operation among agricu tural interests, particularly amo farmers, is imperative.

In the state of Iowa, for instanc 83 per cent of all agricultural retur came from live stock and live sto products in 1925, with corn large as the dependent feed. Already co ering two and one-half million acre the spread of the borer will cast shadow over all of the country's bus ness.

Since the borer sleeps in the cor stalk from October until May, it quite evident that if the cornstall are destroyed during this perio there will be no larvae or worms r maining from which moths may d velop the next June. This is appa ently the weakest link in the borer life and the one to which specialis turn with hope. Already the man facturing industry has co-operate and perfected corn harvesting m chinery along lines designed by t Ohio Agricultural Experiment St tion, which permits cutting the co without any stubble remaining. removing the stalks one of the mo popular harbors of the borer is eli inated.

Other measures which may be ta en, are cutting the corn with a h when cutting is done by hand; ru ning all corn into the silo where t stalks are chopped up fine enough either kill the borers immediately they are later killed through ferme tation in the silo; by shredding a corn stover and plowing the co stubble deeply in the field; and bur ing all unused stover. Particularly states where fields are hogged dow the work to be done in the winter breaking down the stalks by draggi them and then burning. Cornstall must be kept out of the manure.

Corn stubble not plowed unt spring should be disked first and the plowed deeply. The corn cobs shou be destroyed before May 15 becau many of them harbor borers. Th will mean that all corn must shelled which has not been fed t that time.

Auxiliary means of control are cu ting and burning all sweet cornstal as soon as the ears are picked. T borers are especially fond of swe corn. All weeds should be burned the fall and especially fence rows. A. Moore, veteran corn grower at t Wisconsin College of Agricultur stresses this point in particular, b cause the borers can live not only cornstalks, but also in numerou weeds. Moore emphasizes the impo tance of clean farming and expresse the feeling that the attitude of man farmers will need to be changed.

It is just such a campaign that t government hopes to stage in the i fested area. Definite regulations wi probably be enforced regarding t destruction of cornstalks, plowin dates, etc.

Neighborhood Organization Helps

If entire neighborhoods co-operat in annual clean-ups, the chances fo damage are materially lessened. Th government suggests that farmers c operate on a neighborhood basis making certain that recommendation are followed. The government em phasizes especially that if everythin is done within reason to stop the bo er, there is still a possibility of savin the nation's corn crop.

Milk Production an Economical Process

That cattle use their feed more economically to produce milk than for growth has been shown by the Institute of Animal Nutrition at State College, Pa. This has been demonstrated in experiments conducted with the respiration calorimeter, by means of which all of the losses or expenses of feed utilization are measured. By the subtraction of these losses and expenses from the feed intake, in terms of energy, the net balance useful to the animal is obtained.

Using as a standard the value per pound of a feed for the purpose of maintaining the animal, without gain in weight or other useful product, the value per pound of the same feed for milk production is 98.5 per cent, and for growth 76.1 per cent of its value for maintenance.

Director Forbes of the Institute states, however, that milk production and beef production, as agricultural practices, cannot be satisfactorily compared on the basis of physiological economy alone, since each fits into a different practical situation and serves different requirements in human nutrition.

Milk Definitions and Standards

That the differential paid for high testing milk is too low and that the old time legal definition of milk is absurd in the light of our present knowledge were two related subjects discussed by Professor H. H. Wing at the 50th annual meeting of the New York Dairymen's Association.

"It has long been known and frequently demonstrated," said Professor Wing, "that not only is the fat the most valuable but the most variable constituent of the milk. It has also been shown that as the fat increases the other constituents, notably the protein, the next most valuable food constituent, also increases. Milk costs to produce and is valuable for food very nearly in proportion to its fat content. Milk is practically completely digestible. Its nutritive value is, therefore, approximately its energy value, and worked out on this basis milk of varying composition would show an increase in value of six cents for each one-tenth of one per cent where the base price for three per cent milk is $3.00 per hundred.

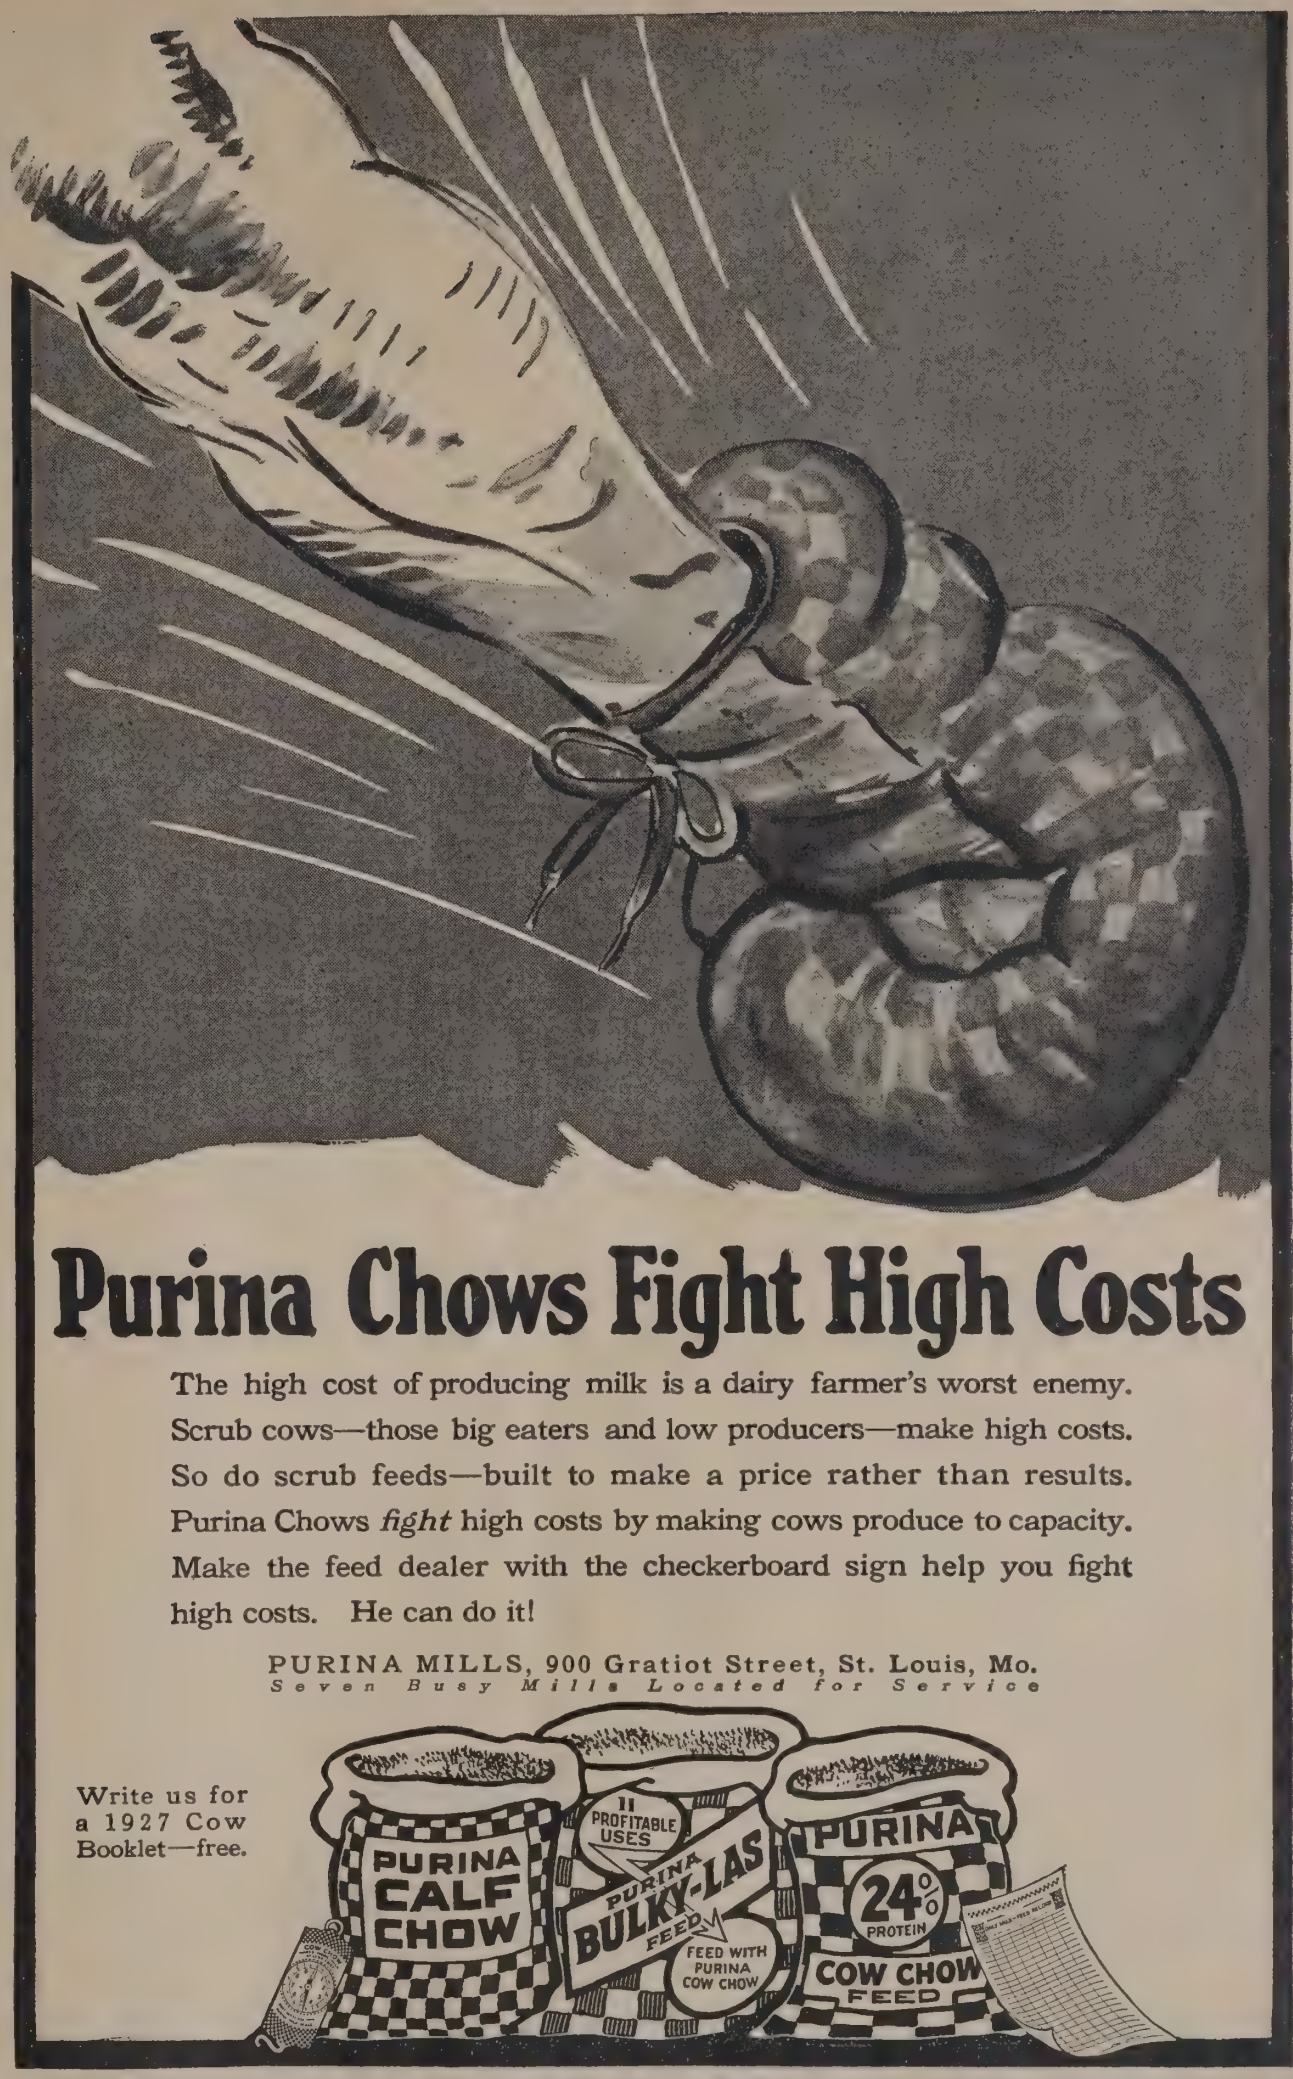
"It is entirely legitimate and so recognized to separate three per cent milk into two products, one containing practically no fat and the other anywhere from 18 to 40 per cent which is called cream. Is it any less legitimate to take the same milk and separate it as before into skimmed milk and another product containing four or five or any other desirable percentage and call it standardized milk or any other name or simply milk?

"So far as the sale of milk is concerned, the state law should provide:

"First. The term milk means the whole, fresh, clean, lacteal secretion obtained by completely milking one or more healthy cows properly fed and kept.

"Second. All milk sold at retail shall bear on the bottle cap or on the container a printed statement of the minimum percentage of fat it contains.

"Third. Within the meaning of this paragraph the term milk shall include milk, skimmed milk, and cream as defined below:



"A—All milk containing less than three per cent of fat shall be called skimmed milk and sold as such.

"B—All milk containing more than three per cent of fat and less than ten per cent of fat shall be called simply milk.

"C—All milk containing more than ten per cent of fat may be called cream and sold as such.

"Fourth—When milk is run through a centrifugal separator the two portions so separated may be recombined in any proportion to make milk or cream of any desired standard.

"Fifth—The state law should cease to define as 'adulterated' milk containing less than three per cent of fat and 11.50 per cent of total solids."

Purina Chows Fight High Costs

The high cost of producing milk is a dairy farmer's worst enemy. Scrub cows—those big eaters and low producers—make high costs. So do scrub feeds—built to make a price rather than results. Purina Chows *fight* high costs by making cows produce to capacity. Make the feed dealer with the checkerboard sign help you fight high costs. He can do it!

Another 1,000-lb. Fat Producer

The first Holstein cow to produce 1,000 lbs. butterfat in Class B, (milked 3 times daily) is, according to the Holstein-Friesian Association of America, Mechthilde Pontiac Segis Lady owned by the Pottenger Sanatorium Co. of California. As a 4-year-old she has recently finished a 365-day record of 32,092.2 lbs. milk, 1,005.2 lbs. butterfat (1,256.5 lbs. butter).

A man's true wealth is the good he does in the world.—Mahomet.

LIVE STOCK FOR SALE

Holsteins—Get your next Ormsby bred bull from State Institutional herd. Bred for high yearly production. Send for tree bull list. Can furnish nice lot of grade heifer calves. BOARD OF CONTROL, State Capitol, Madison, Wis. 3-6

Express Prepaid on Holstein Bulls up to 500 miles. Ages from 2 to 10 months. Yearly record dams and grandams. Prices reasonable. Federal supervision. Write for sale list. WINTERTHUR FARMS, Winterthur, Del. 5-*

Holsteins—Purebreds and grades. Area tested. Buy direct. We are breeders, not dealers. WAUPACA COUNTY HOLSTEIN BREEDERS ASSN., 112 E. Union, Waupaca, Wis. 5-6

Four Handsome Holstein heifer calves and registered male calf. First check $110. ALFAKORN FARM, Evansville, Wis. 4-2

35 lb. bull; Pabst Champion Korndyke, and 1½ year old son. Will exchange. GEO. G. SCHOEWE, Waukesha, Wisconsin.

Can supply you with carload choice springing or fresh grade Holstein cows. Several with C. T. A. records up to 500 lbs. fat. W. L. BAIRD, Waukesha, Wisconsin. 2-*

Holstein Bull. Three of his dams averaged 108 lbs. milk 1 day, 40.48 lbs. butter 7 days, $125. ROY HARRIMAN, Appleton, Wisconsin. 26-*

Grade Holsteins—Springing and fresh cows and first class heifers from an area tested county. Clean cattle at right prices from a breeder with 30 years' experience. Can also furnish grade or registered Guernseys. JOHN ERICKSON, Waupaca, Wis. 18-Spl

Three handsome Holstein heifer calves, registered, $100, ALFAKORN FARM, Evansville, Wis. 2-5

If you want real choice Holsteins, any age or number, write H. E. ANDERSON, Whitewater, Wis. 2-24

The South Dakota Holstein-Friesian Association have their second Breeders Directory ready for distribution. Write for copy. A. F. TEST, Sec'y., Mitchell, South Dakota.

For Sale—200 head of choice Holstein and Guernsey cows and heifers, consisting of five entire farm herds, at a reasonable price. WHITEWATER STOCK FARMS, Whitewater, Wis. 2-*

15 Holsteins and 15 high grade Guernseys for sale. M. DUNPHY, Route 4, Waupaca, Wisconsin. 5-12

Purebred Guernseys—Ten bull calves, six heifers, seven cows. Good records. Purebred Hampshire swine. Best strain. VALLEY GEM FARMS, Arlington, Wash. 5-2

Registered Guernseys for sale. Open and bred heifers, serviceable bulls. HARVEY LONGLEY, DOUSMAN, Wisconsin.

For Sale—Special offering 2 registered Guernsey heifer calves and 1 bull not related. See display ad page 298. LINWOOD GUERNSEY FARM, Homer Rundell, Livingston, Wis. 1-*

High grade Guernsey and Holstein cows, springers and fresh. Car lots or less, T. B. tested. Registered bulls. H. R. LOBDELL, Mukwonago, Wisconsin, Waukesha County. Highway 61. 11-*

I have usually 100 head of high grade Holstein and Guernsey cattle on hand for sale. RALPH HUDSON, Milton Jct., Wisconsin. 7-*

Guernsey Bulls For Sale. A. R. breeding, excellent individuals, nicely marked and in fine condition. Also two pure-bred heifer calves four months old. BRIAN L. RUNDELL, Livingston, Wisconsin. 4-2

Guernsey Bulls for sale, 4 to 13 months. Dam's record 650 lbs. fat. Popular breeding. Write DALE E. RUNDELL, Livingston, Wisconsin. 3-3

Guernsey bull calves; beautiful color; show type; record dams; guaranteed. Accredited. FRANK KLEMM, Baraboo, Wisconsin. 5-2

For Sale—Grade Guernsey cows, fresh and close springers. M. GOLDSMITH, Genesee Depot, Wis. 4-2

Registered Guernseys—Females and males. Send for list. MATH MICHELS, Fond du Lac, Wis. 10-*

Grade Guernsey springing cows and heifers are plentiful in La Crosse County. For prices write H. W. GRISWOLD, West Salem, Wis. 15-*

High Grade Guernseys. Justamere Guernsey Farm is offering your choice of herd, no reactors, 60 day retest guaranteed if they go into clean place. Fresh, springing and fall cows. Prices very reasonable. CHAS. W. BLOTT, Mukwonago, Wis. 17-*

Guernseys for sale. Rock County Guernsey Breeders' Association Co-operative. Write FARM BUREAU, Janesville, Wisconsin. 2-4

Guernseyland (accredited) offers registered bull born February 20, 1926. Price $60.00. LYNN BRIGGS, Van Dyne, Wisconsin.

Guernsey Bull, Registered, richly bred, fourteen months old. First check $105. ALFAKORN FARM, Evansville, Wis. 5-2

Bull Calves, Dots Cherub breeding from Dams with good A R records. QUINEILO FARMS, 607 Trust Company Building, Milwaukee, Wis. 5-*

LIVE STOCK WANTED

Wanted—One or two very high record grade Holstein or Guernsey cows. State age of cow, record both of milk and butterfat, by whom record was supervised, and price asked. KARL E. SUTHERLAND, Williamstown, Mass. 5-2

BABY CHICKS

If you want more eggs and larger profits our Accredited high-egg yield White or Buff Leghorn chicks will be your choice. Catalog free. RIVERVIEW HATCHERY, Fort Atkinson, Wis. 5-2

Pure Bred Chicks from high egg producing breeders. All breeders Hogan tested and strictly culled for correct size, type, color, and health; correctly mated for high egg production. Write for our new free "Poultry Profits" book containing valuable information for the poultry raiser. Liberal discount on all orders booked early. Pure bred chicks of all standard breeds for immediate delivery. WEDGEWOOD POULTRY FARM, Box 188, Pontiac, Ill. 3-*

500,000 High Grade Hollywood sired White Leghorn accredited chicks. Males and females passed and banded by State Poultry Association. Sturdy and vigorous heavy producing breeders assures chicks of quality and ability. Special discount now. Catalog free. WYNGARDEN HATCHERY & FARMS, Box 26, Zeeland, Mich. 5-3

Baby Chicks from culled, inspected flocks. Satisfaction guaranteed. EVERGREEN POULTRY FARM, Kewaunee, Wis. 4-6

POULTRY

Blue Ribbon Giant Brilliant Bronzed, Vigorous, disease-free turkeys, eggs and hardy turks, 100% arrival. Unrelated flocks. We're leaders. GREGORY TURKEY FARM, Cumberland, Wis. 5-4

Bronze Turkeys, Toulouse Geese, McCRADIE, Hendrum, Minnesota. 5-2

MACHINERY

Milkers for sale cheap. Second hand DeLaval, Empire, Surge, Universal, Burrell, Fords, Sharples, and Perfection. Also new Hinman. J. C. MARLOW, Mankato, Minn. 4-*

Rubber Tubing for all makes of milking machines. Very highest quality only. Attractive prices. ANDERSON MILKER COMPANY, Jamestown, N. Y. 24-*

Separator Bargain for quick sale. Seven new separators in original boxes. F. J. NICHOLS, Box 355, Lansing, Michigan. 3-4

For Sale—Blue Ribbon Electric milker. Used 11 months, A-1 condition. First check for $85.00 gets this bargain. BOX 32, Hazelton, Ida.

Boilers, new 5 horse flueless, $170. All sizes, low prices. CASEY BOILER WORKS, Springfield, Ohio. 3-Spl

For Sale—Sharples Separator; good condition; reasonable. Address BOX 319, care Hoard's Dairyman.

AGENTS WANTED

Our New Household Device washes and dries windows, sweeps, cleans walls, scrubs, mops. Complete outfit costs less than brooms. Over half profit. HARPER BRUSH WORKS, 295 3rd St., Fairfield, Iowa. 5-2

Agents—New Plan, makes it easy to earn $50.00 to $100.00 weekly, selling shirts direct to wearer. No capital or experience needed. Represent a real manufacturer. Write now for Free Samples. MADISON CORPORATION, 564 Broadway, New York. 5-24

We pay $200 monthly salary, furnish car, and expenses to sell our Guaranteed Poultry and Stock Powders. BIGLER COMPANY, X352, Springfield, Ill. 4-3

SALESMEN WANTED

Salesmen wanted to sell "Waukesha Mineral Feed." Exclusive territory, good commissions. Ask for particulars now. H. J. WELSH, Box 111, Waukesha, Wisconsin. 2-8

CREAMERIES

Creamery—Central Illinois; Ice cream manufacturers, retailers of milk. Sales $100.00 daily. Address BOX 321, care Hoard's Dairyman.

LUMBER

Fir Lumber, Red Cedar Shingles, Fence Posts shipped direct from manufacturer to you. Send bill for delivered prices. LANSDOWN, Box 909S, Everett, Washington. 5-2

We Save Dairymen $1.00 per carload on lumber, shingles, house bills, etc. Guaranteed grades. KENWAY LUMBER COMPANY, Tacoma, Wash. 5-10

MATTRESSES

Mattresses made any size, low factory prices. Catalog free. PEORIA BEDDING COMPANY, Peoria, Illinois. 3-10

FARMS FOR SALE

Oregon Invites Farmers—to take a few week's vacation this summer! No one class needs a vacation more than the farmer. It is a good investment and while vacationing in Oregon you might investigate the opportunities for settlement on her irrigated and non-irrigated lands. It is a great country for diversified farming, for the raising of fruits, vegetables, nuts, grain, roots, for the poultryman and dairyman. Land can be acquired cheaply and on easy terms. There is every kind of outdoor recreation and excellent schools. Write, today, for any kind of information to the publicity dept., room 744, Portland Chamber of Commerce, Portland, Oregon.

Strout's New Farm Catalog—126 illustrated pages of interesting vital information for the farm seeker. Farms of every kind, bargains all; for instance, page 43 describes farm at about half value, 110 acres, good 10-room house, 2 nice barns, cement basement; 65 acres heavy-cropping fields, 20-cow pasture, large variety fruit and berries, near all advantages; price only $3500 including 10 choice cows, heavy horse, 75 poultry, all equipment, crops; part cash. Avoid losing the farm you want. Get this free catalog today and take first choice of bargains. STROUT AGENCY, 255-DL, 4th Ave., New York City.

Dairy—Have an ideal location for a dairy close to Casper. Will sell at a sacrifice, irrigated, ditches all in, water right fully paid, gravity flow from the Platte river, bottom land, sandy loam soil, under cultivation, 320 acres—more acreage can be arranged for—5 room house, large barn, fenced and out buildings. $70.00 per acre, 1-3 cash, 5 years on the balance. Casper and vicinity ship in 75% of her dairy products. 40,000 population for a market and milk wholesales at 52c per gallon. For further particulars write J. E. NELSON, 1044 E. First St., Casper, Wyoming. 4-3

Dairy farm 160 acres, Barron County, Wis. Modern 8-room house, light and water. 2 barns; 1 has cement floor, 16 stanchions; silo. Cement floor granary; machine shed; tile milk house; hog house. Soil clay mixed with sandy loam. 90 acres plow land; 70 acres pasture and wood lot. Will sell to experienced farmer at a price and on terms which can be met from income. References requested. A few other Wisconsin farms on same terms. For particulars write C. M. PUTNAM, P. O. Box 376, Madison, Wisconsin. 5-4

Choice Washington, Dodge and Fond du Lac County farms for sale at reasonable prices. All completely equipped with stock and machinery and now being operated by tenants. From 60 acres to 240 acre farms. Good buildings, good locations for markets and schools. We own all of these farms and will sell on liberal long term payments. Write or call. A. L. ROSENHEIMER REALTY CO., Kewaskum, Wisconsin.

Farm Land For Sale—588 acres at $30.00 per acre. 8 miles from Chester, county seat, on improved county road. Excellent livestock farm. All or part for sale. 120 acres at $20.00 per acre, 1 mile from railroad station, on state highway, 14 miles from Chester. Large creamery in Chester. Mild year round climate permits two crops per year. County is Guernsey cattle center of state. For accurate particulars address: CHESTER CHAMBER OF COMMERCE, Chester, South Carolina.

Chautauqua County, New York, ranks fourth in the United States in the value of its agricultural products—based on area. A beautiful county noted for its grapes, dairy farms, and Chautauqua Institution on Chautauqua Lake. The large eastern markets are adjacent. New York City is twelve hours distant. Good productive farms can be bought for $30 per acre, which is below their intrinsic value. The time to buy is now. For further information address CLYDE F. FISH, Jamestown, N. Y.

2000 Middle West farmers moved to Oregon in last two years, after thorough investigation. They like our mild winters, cool summers, with no severe storms to ruin a season's work and destroy property. Fine roads and schools, productive soil, good official bulletins and illustrated facts booklet, free. Land Settlement Department, OREGON STATE CHAMBER OF COMMERCE, 265 Oregon Building, Portland, Oregon. 3-4

Equipped Farm, modern convenience. ELI A. SHORT, Georgetown, Delaware. 4-2

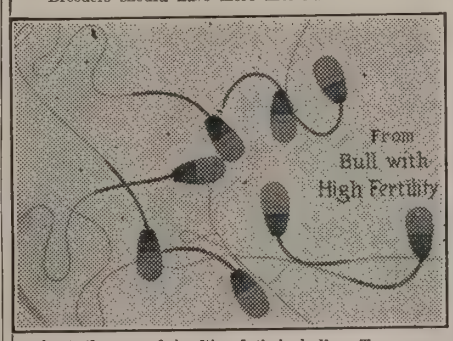
Herd Sire is Important Cause of Abortion and Sterility



by W. W. Williams, D. V. M., Springfield, Mass.

The cause of abortion and sterility is often found in various disease conditions of the bull. It is common for weak or imperfect spermatozoa to be eliminated. Such cells either cannot unite with the egg from the cow (sterility), or if uniting, result in the formation of weak calves which are liable to be aborted.

Breeders should have more first hand information about the sexual health of their bulls. Too many breeders are treating their cows for breeding diseases caused by a diseased bull and then continue to use that bull.

A careful examination of the spermatozoa from the bull is essential in determining the cause of outbreaks of abortion and sterility, it forms the basis by which the reproductive ability of a bull may be anticipated, furnishes the means by which dangerously diseased bulls may be recognized and eliminated from service before severe damage has been done to the herd, and gives the prospective purchaser of a bull the most valuable guarantee of a bull's reproductive fitness which is to be had. No bull should be used in a herd of merit without first having assurance that he is healthy.

A correct diagnosis prevents useless, misdirected treatment and protects the breeding health of the herd. Consult your local veterinarian about having the necessary examinations made. There are none better qualified to give the breeders the necessary help than the trained and experienced members of the veterinary profession.

Absolute Dispersal Sale!

BABY CHICKS! *Get the large, strong, easy-to-raise kind that have made the Mueller-Cory Hatchery famous!*

FREE! Our new bulletin entitled "Are You Keeping Hens or Are Your Hens Keeping You?" will be mailed free to all who ask for it. A fund of valuable information based on actual experience in the poultry business.

Write for our large, handsomely illustrated catalog and read it from cover to cover. Compare the *facts* contained therein with the *claims* made by others. Then decide for yourself where your investment will net you the greatest profit.

MUELLER-CORY HATCHERY, 207 Main St., FORT ATKINSON, WIS.

Figure This Up!—

100 Blackhawk Accredited chicks hatched from flocks producing 140 to 160 eggs per year or better at $15.00 per 100.

100 ordinary hatchery chicks hatched from flocks of unknown egg production, probably not more than 80 to 90 eggs per year, which is high average for this type of flock at...$12.00 per 100.

As the offspring will be no better than the flocks which produced them, which is the cheapest?

Drop a postal for our fine 48 page catalog for the answer and see unretouched photographs of the flocks producing our hatching eggs, also each breed of chicks we hatch ready to ship.

Poultry on the Dairy Farm

A Profitable Foundation

Whenever the days begin to grow longer and the sunshine becomes just a little stronger, we should become interested in plans for the chick crop. There may be a few more severe storms but even that should not interfere with any plans which we may have made.

Possibly three things at this time will determine our poultry success for next year. Even though it does not control the profit it will be at least a foundation on which to build. The three legs for this stool are: (a) quality of chicks, (b) time of hatching, (c) rate and time of development.

A pullet when hatched will probably be "geared" to a certain rate of production. From her parents she has inherited the power to produce either a large or a small number of eggs. If we wish to procure a flock of potentially high producers it is imperative that we obtain chicks from known high producing lines.

If we are home hatching or having the eggs from our own flock custom hatched, we should have a special breeding pen. This unit can at least give us our breeding cockerels for the next year.

The selection should have been made last fall. In late October or November a selection could have been made from the flock then on hand. The hens that were at that time still producing and conformed to what we desire in size, body shape, time of molt, and vigor can be selected and banded. They can be allowed to run with the rest of the laying flock, until mated in the spring.

These hens should be mated with a pedigree, production bred cockerel. He should have everything that goes with a pedigree. Not only should the dam and sire be or come from producers but the cockerel should be vigorous, free from disease, and active. The habit of buying just what the pedigree says rather than what one also sees will lead only to trouble and failure.

If one did not select the pen last fall it is still possible to do so even though a little more time, work, and skill are required.

It is not imperative that the pen consist of hens. They can be well matured pullets. Proper supply of the necessary materials in a ration has discarded the old theory that pullets cannot produce hatchable eggs. Hatchability consists more in filling feed requirements than in age of stock.

At this season one can select the pullets that have given the most uniform, sustained production. This also means the pullets that started early and stuck with the job. Probably this is best indicated in the yellow skin birds by the rate and amount of fading which has taken place in the eyelid, beak, and legs.

One might, as many breeders do, especially if trapnesting, band as the pullets start producing. It is not necessary to trapnest in order to do this, for anyone can detect the laying pullets. They can be marked with colored bands. From this group the best can be retested as breeders.

Home hatching or the production of hatching eggs has become more (less of a specialized branch of poult keeping. The largest group are bu ing baby chicks from some hatcher

The demand for chicks has had t many operators starting that we more interested in making a pro than in producing quality chicks. great many others produced po quality stock because the busine was new and they were not expe enced.

To overcome some of these obje tions it was necessary to establish standard of some sort. This dema resulted in the inauguration of i spected flocks and accredited hatche ies under state supervision. It w deemed necessary to operate under state label since this permitted a di interested control.

Some deviation has been made the various states but the plan as whole is the same. Each flock pr ducing eggs for a hatchery is inspe ed and must conform in purity breeding, production, and freedo from disease as indicated by physic appearance. The same is true of t males and they, too, must be band with a sealed band.

A hatchery must agree to certa regulations such as record of sour of chicks, purchaser, operation machine, handling of chicks, and co formity to standard.

Chicks produced under these pla are usually sold under label direct the purchaser as inspected and a credited chicks. In some states t white diarrhea test may be require while in others the work may be co ducted under the supervision of a association. The aim in all cases the production of better qualit chicks.

Another advance has been ma since some states have adopted ce tification. This means an accredite or inspected flock that is headed onl by pedigree 200-egg or better male The males must come from a d pendable source. This demand wi again increase the quality of chic which it is possible to buy. Th greatest limitation to this work is th possibility of obtaining 200-eg males. It is one thing to claim suc records and another thing to be su of the source.

Hatcheries are so distributed a this time in every state that lon shipments are not required. One usu ally obtains chicks within easy shi ping distance so that they will spen a minimum of time in transit. Thi means that the chicks will have les opportunity to become chilled, heat ed, or mishandled. Shipping a lon distance never improved a chick.

Numerous terms and names ar applied to hatcheries other than thos described. The quality which on will obtain depends more upon th selection practiced in the breedin flock and the business integrity o the operator than in the name.

Buying baby chicks entails th same chance as any other transactio may entail.

Part of the chicks may be hom hatched and others purchased for de livery at the same time. By this com bination a larger flock can be ob tained which will result in better care better growth, larger group of broil ers to sell, and more uniform growth

Genoa Quality Chicks

Several years of hatching, rigid culling and selecting has given us chicks that verify our claims for **QUALITY.** Our flocks are headed by Males from Mahood, Harrison, Bonnie Brae, J. T. Thompson, Mapleside Farms, Pape, etc. Flocks culled the past two seasons by State Inspector. Write for Free Catalog and low prices. 10% deposit books your order.

for the pullets when housed in the fall.

In addition to the kind of chicks, one must also consider the time of year that the stock is hatched. Poultry is only a crop which we are growing and demands a definite growing period. If we are also to obtain the greatest income for the year we must adjust our production program to conform to the market conditions. Any marketing system will never change the peak price back to December and January. We must rather produce eggs when the market wants them.

A Leghorn will usually require about 180 days for growth. This means that a pullet to start producing in October should be hatched in April. The heavier breeds will require about one month more of growth. When chicks are June hatched one can only expect a January or February production.

This factor of growing period is often overlooked. We assume that chickens, like Topsy, just happen. They just happen to hatch, happen to grow, and when the price of eggs reaches a high point are supposed to happen to lay.

It is imperative that a person plan in advance for egg production. Pullets must be hatched in time to be matured in time to start producing when we want the eggs rather than when they may be convenient.

This cry of early hatching has almost become a by-word. For years it was impractical because of the many limitations. At the present time the establishment of hatcheries makes possible obtaining chicks; perfection of brooders prevents chilling even when operated in the recommended portable colony houses; and rations can be fortified to permit rearing in confinement over quite an extended period without the development of leg weakness or rickets.

With this combination it is possible for the average farm flock owner to rear chicks early, economically, and successfully. All that most people now need is the courage to start and the attention to details required in brooding at that season.—J. B. HAYES.

Wants Methods Criticised

We use the Wisconsin chick ration in our broodery. We find that the broilers or roosters pay for themselves and pullets at three months of age. Would like to have you criticise our methods. We feed chicks nothing for first 72 hours beyond what they eat of their litter which for the first two weeks is clean, bright, alfalfa hay. At 72 hours we give steel cut oats in litter or on papers and a little mash, about what they will clean up in five minutes. This is fed every two hours. At end of first week they are put on self-feeder and kept there for ten weeks.

Our broilers are fed the same ration with the addition of ten parts digester tankage and 10 parts oil meal, and reach two pounds in eleven weeks. Is it not possible to add cod liver oil or yeast and shorten the feeding period of broilers?

We start R. I. Reds on February 15 and Black Minorcas on May 1. Please tell how to handle these pullets to prepare them for winter layers.

What do you recommend to feed laying hens for a tonic?

Tripoli, Ia. G. V. A.

There isn't much of an opportunity to offer much criticism on a method which makes it possible for the broilers to pay for themselves and the pullets at three months of age. This is mighty satisfactory brooding and is the standard towards which we have been attempting to work in connection with our regular extension program.

You have been successful in carrying the chicks through 72 hours without feed in that you have supplied

FARROW CHIX FOR SUCCESS

BANKING

Buyers of Farrow Chix start banking their winter receipts sooner than raisers of unknown Chix.

Our 200 egg strain are positive winter layers

MORE WINTER EGGS

This is the cry of thousands of poultry raisers. When eggs are high and profits the greatest you need Farrow Chix to fill the egg basket. Our Star Matings White Leghorns—bred to produce 200 egg pullets—can do this for you. A few dozen eggs in winter will more than pay difference in cost of these chix and common stock. You can't get blood out of a turnip. Neither can you expect to have laying chix from non-laying hens. Be sure of winter eggs and order our Star Matings. They are winners in egg contests. They will win for you. Tancred, Hollywood, Barron blood lines. Chix from America's Wonder Layers.

WARNING

Don't confuse Prof. King's Iowa Hatchery with any other. Address all letters to the IOWA CHICK HATCHERY

them with bright alfalfa hay. We have adopted a plan of keeping the chicks in the regular shipping boxes even when we hatch them ourselves until they are old enough to be fed. This prohibits and avoids a great many of the troubles that we have encountered on the part of other people from time to time when they would put a bunch of chicks under a brooder on sand or gravel or something of this sort and not give them any feed for 72 hours. Under these conditions, of course, the chicks would load up on sand or whatever else they might have access to with the result that a heavy mortality would occur. In your case the more of the alfalfa that they eat, the better prepared for good growth they are going to be. In case you should not have alfalfa, though, I would advise keeping them in the boxes until it is time to feed them when they may be placed under the brooder.

Your method of limiting the amount of feed which they are allowed to have for the first few weeks is advisable. A great many people have been successful in filling the hoppers with the 80—20 dry mash mixture, and the fountains with milk before the chicks as soon as they are placed under the brooder and allowed to remain there continuously. Personally, I am a little bit afraid of this as a general recommendation and feel that a person, year after year, will be more successful and will rear more chicks, if the feed which they are allowing will be restricted for the first few weeks or until they are allowed free range. Just as soon as they are out on range it is possible to leave the mash before them at all times because of the additional space in which they have to work, and on that account the possibility of avoiding cannibalism and other habits, such as this which we try to avoid, when they are kept rather closely confined.

It may be possible that the addition of cod liver oil to the ration at the rate of about 2% will give you additional growth. This would probably be possible even if you have an abundance of sunshine, because of the vitamins which the cod liver oil supplies that cannot be substituted in the form of other feed.

We usually try to hasten the growth as much as possible on the pullets up until the time they reach 1½ lbs., when from that time on we endeavor to control development in order to have production starting along in October. The 80—20 mixture works in admirably in this respect since it is only necessary to diminish the amount of milk which they are given to drink or to cut down the percentage of animal protein feed, such as the meat scrap and to leave the minerals which means the pearl grit, high calcium carbonate limestone grit, and the bone meal just as they were. Limiting the amount of animal protein will tend to delay maturity, but the rest of it being supplied will tend to increase the frame work or the size of the birds.

About a month before you house them they can gradually be turned over to the laying mash which you may be using to accustom them to this before they are housed and to house them early enough so that they are broken to the confinement before production starts.

The pullets, of course, want to be fed heavily on grain feed in order to have them in good physical condition, which means rather fat, before starting to force them. This reserve which we can establish in that way will give us a more continuous production after they once start and will tend to avoid considerable of the molt which was experienced along during the winter and also this starting stopping sort of production which get from pullets in rather poor cor tion. These birds, which are put i the house when only partly finish may, because of good breeding, started, but they can't maintain uniform production such as we des

The only tonic that we recomm for chickens is good feed. If one a well bred bunch that has been b for production and is given right sort of a ration properly b anced, the birds are going to conv this feed into eggs without the ac tion of any sort of a tonic or a stir lant. Under this heading we do class cod liver oil as a tonic or a st ulant, since that is a regular part the formula especially here in northern states and must be gi proper consideration.

Some very interesting work v carried on by one of the south stations recently in connection w the use of tonics that very admira shows that they are not necessary production.—J. B. HAYES.

Mating Geese

Please tell me if one gander enough for four hens.

Alta Vista, Ia. A. B. K.

The number of geese which it possible to mate with one gander pends largely upon the age of t gander and also upon the possibil often of getting this gander to ma with the geese. One usually fir that when a mating is once made is advisable to continue that just long as possible in order to avoid a display of choice which may be in cated on the part of either sex. Y will very often find that a goose w not mate with a gander during t first season. On that account it necessary to mate them seve months in advance of the time th you expect to collect the hatchi eggs. Usually only two geese a mated to a gander, but it is possib to increase the number up to fou In this case this probably would the maximum that one could carry a mating, and the success would dependent in this case upon the i dividuals which were carried, t length of time which they were ma ed in advance, and the possibility eliminating any display of selectivit

In case one did not get good fe tility it would be possible a little l later to decrease the number of gee which you have carried.—J. B. HAYE

T. B. in Poultry

The symptoms of tuberculosis poultry are: A sickly-looking hea pale comb, dull eyes, lameness, lo of flesh, especially on the brea bone, gradual wasting away but t appetite remains good. In the la stages the claws are long, the feat ers dull, and diarrhea may be pre ent. It is not likely that all t symptoms will appear in every d eased bird but the appearance of a one of them should be the cause f suspicion. The symptoms of tube culosis are very seldom present birds under a year old but the bi may be badly infected and not sho any change in appearance.

The lesions or evidence of tube culosis is found in the liver, splee and intestines. The liver may be e larged and gray or yellow nodul from a pin point to a dime in size a on the surface. The spleen may enlarged and spotted. Both liver a spleen break very easily. The inte tines may be well covered with no ules large or small. The breast bo may be bare of flesh.

The poultry tuberculosis bacillus generally considered to be a variety the same species which causes tube culosis in man and cattle. It is know

Saving Your Chicks

Why Chicks Die in the Shell—Why Millions Die the First 10 Days

Here is something we want every reader of this paper to have. It's a copyrighted book giving a world of information on hatching, brooding and feeding baby chicks. It tells you why chicks die in the shell, why millions die before they are two weeks old, tells of real home made brooders, what, when and how much to feed.

It is simply a book of startling facts, pointing directly to the cause of why millions of chicks are lost every spring. Now right here is some real information you have wanted to know so long. It sure tells you the cause of all these baby chick troubles.

Get you a copy of this book right now while you can. It is copyrighted, owned and controlled exclusively by one concern—there is no where else you can get it. Just write Tredway Poultry Service Co., Blackwell, Okla. Mention this paper, send the names and addresses of 5 persons who raise poultry, and 25c in silver, and book will be mailed you prepaid, One book only to each person or family. Dou't try to raise another chick without this book. Remember you must send the names with the 25c. Write them today — you will never regret it.

CAPPER SHIPS C.O.D.

Send No Money—Simply tell us what breed and how many you want. All chicks hatched in our own incubators from Cert-O-Culd flocks. 97% alive arrival guaranteed.

LMENDINGER HATCHERIES, Rocky Ridge, Ohio.

to be the cause of a large part of the tuberculosis in hogs and should therefore be regarded as a highly dangerous disease. The avian bacillus will live for a long time in soil or droppings but is readily killed by heat or direct sunlight. Ordinary disinfectants act rather slowly on it.

The sick fowl is a spreader of the disease and the droppings from the bird will contaminate everything they come in contact with. Healthy birds readily take the infection especially where unsanitary conditions exist.

Tuberculosis can be eradicated only by disposing of the infected stock. Treatment is of no value and testing is practical only in valuable breeding flocks. To eradicate the disease:

1. Kill and burn all birds showing symptoms of tuberculosis.

2. Replace the entire flock as soon as possible with healthy birds raised on clean ground.

3. Put dropping boards in poultry houses and keep them clean.

4. Market the old hens each year as soon as they stop laying.

5. Burn or bury deep all dead birds.

6. Get plenty of fresh air and sunlight into the house.

7. Plow up and sow down land where practical.

All sick birds should be opened and if unable to identify the trouble call on your local veterinarian or county agent, or send the next sick bird to the College of Agriculture, Veterinary Division.—DR. A. J. KNILINS, National Live Stock Exchange.

A Splendid Record

HOARD'S DAIRYMAN:—A Waukesha County hen laid 318 eggs from Nov. 18, 1925, to Nov. 18, 1926, or 318 eggs in 365 days. Mrs. Clyde Fruit is the owner of this hen whose record is as follows: November, 11; December, 23; January, 25; February, 24; March, 26; April, 28; May, 30; June, 29; July, 28; August, 28; September, 28; October, 25; November, 13 up to the 18th of the month.

This S. C. White Leghorn hen maintained her body weight and has not rested longer than two days since she began her record up to this writing.

Wisconsin. CLYDE FRUIT.

Cheated

Clerk: "How are you coming along with your poultry?"

Customer: "I've been swindled. I bought three different incubators and not one of them has laid an egg yet."

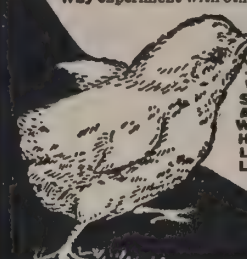
SIEB'S GUARANTEED CHICKS

from CERTIFIED HOGAN TESTED HEAVY LAYING FLOCKS



AT ASTONISHING LOW PRICES. WHY PAY MORE?

Genuine high quality is found only in chicks from stock bred many years for laying ability and exhibition purposes. Sieb's Certified Chicks are produced from flocks bred thru generations for these qualities. Every bird in our flocks HOGAN TESTED and certified for high egg production.

PROOF OUR CHICKS ARE BETTER

We received hundreds of letters similar to these. It shows why our customers are PLEASED and SUCCEED. Mr. Roy Burke, Wis., writes—the 150 Ancona chicks arrived May 3. I raised 144 of them. Pullets started laying Sept. 27th. Sold some cockerels at $25.00 when eleven weeks old. Kindly mail me your new catalog my order will go to Sieb Hatchery again. Mr. Geo. Wood writes—The red chicks received from you last year were the best I have ever seen. I sold some of the pullets at $1.50 each. The laying average of my flocks last Fall and Winter was 71%, while the so called celebrated Leghorns around the neighborhood were idle. 71% FLOCK AVERAGE during Fall and Winter is equal to a yearly average of 255 EGGS PER HEN. Why experiment with others when you can get this quality at our low price? Sieb Certified Chicks are of only ONE GRADE—the BEST. SEND FOR CATALOG or order direct from this ad. 97% live delivery guaranteed, prepaid.

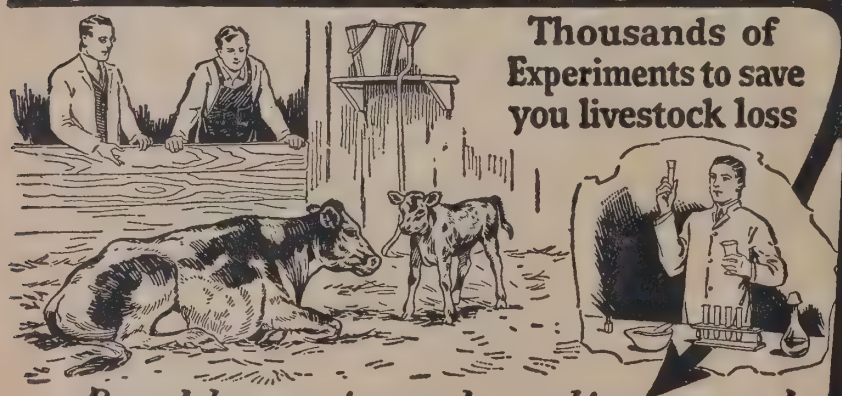
COLUMBIA HATCHERIES, Box 63, COLUMBIA, MISSOURI

The Southland ~a STOCK LAND

The Southland, served by the Louisville & Nashville Railroad, is fast becoming a land of stock raising and breeding along modern, and profitable lines. With the one-crop system dead and gone, diversified farming has come to stay; and good farmers of all kinds are more than "making good" here.

Stock farming in the North is made hard, and often unprofitable, by long winters, calling for costly housing and feeding. Not so in the Southland—mild climate; green pastures all the year; the winter stock feed needed raised on the home farm; abundant water; plenty of cheap labor—and home markets with top prices. What more could a stock farmer want?



Write and tell us what kind of stock farm you want and we will tell you where to find it—and give you valuable pointers on how to run it, in the Southland. (We cannot, however, undertake to get anybody a job as a farm hand.)

Full information and descriptive booklet sent *free* on request. Address G. A. Park, Gen. Imm. & Ind. Agt., L. & N. R. R., Dept. H.D-6, Louisville, Ky.

L&N

What's Back of B-K

Thousands of Experiments to save you livestock loss

Read how science has discovered effective treatment for abortion calf scours, retained afterbirth.

We Have Thousands of Letters Like These

Milking Machines

"I am using B-K solution to keep the cups and rubbers of my milking machine in, and find it one of the greatest cleansing agencies. It keeps these parts in a sanitary condition to a point that seems almost unbelievable. B-K keeps all sediment and dirt out of the cracks and crevices and reduces the bacteria count."
William W. Moore, —, N. J.

Contagious Abortion

"B-K sure does the work, as the arrival of strong, healthy calves is proving; the first that have lived in over a year. There were also three cows that were barren, that we have now got in calf. Nine more are almost due to calve and are all looking fine. All the credit is due to B-K."
I. Mann, —, Colo.

Calf Scours

"I had a calf with white scours. We had given up hopes of saving her, when a friend gave me a small bottle of B-K. It cured the calf so I bought a gallon. Now I want all six of your bulletins, as I wish to put B-K to all possible use. It's good stuff."
J. C. Brown, —, Ohio

B-K Bacil-Ki

In talking with farmers and stock raisers at state fairs, dairy shows and in their homes, we find few that realize the vast amount of practical and scientific knowledge and experience represented in the organization back of B-K. That organization is composed of practical farmers, breeders, milk plant operators, chemists and bacteriologists.

B-K has been tested so thoroughly from every angle in our laboratories and on farms that its effectiveness in the prevention and control of disease among live stock and poultry is now beyond controversy.

The experience and knowledge we have acquired is available to you without charge. Our free bulletins include a wealth of information on breeding, feeding and sanitary care of live stock and poultry. Our advice and counsel on any problems not covered in the bulletin will be given gladly on request. Write us about your troubles fully so we can give you the benefit of our investigations and experience.

Live Stock and Poultry Owners get this 64 page book

We will send it free if you will write us the number of animals or birds you have and the breeds you push.

(EDITOR'S NOTE: This is the fifth of a series of six articles on the dairy breeds in the United States. The next will appear in an early issue.)

Buffaloed

"Look," said the American, pointing to the Statue of Liberty, "there's New York and Liberty—as American as the bison itself."

"My word," exclaimed the Englishman, "do you claim the jolly old bison as your own, too?"

"Surely," replied the American, "the bison is a species of the American buffalo."

"Ho, ho," laughed the Londoner, "if I didn't always think that the bison was something to wash your 'ands in."—Ex.

LIVINGSTON COUNTY TRUST COMPANY

To Young FARMERS SEEKING OPPORTUNITY

Investigate our attractive proposition:

Write to us for details regarding the fertile Genesee Country of Western New York. We will tell you how good farms may be bought or leased on easy terms if you own your own farm implements. These farms offer most alluring prospects for farmers engaged in dairying, raising canning crops, alfalfa and timothy hay, small grain, and sheep and cattle feeders.

Good roads, nearby markets, railroad facilities, schools and churches make these farms most desirable. Address

LEO M. ALLEN, Manager
Farm Department

Low Priced Land—Year 'Round Season
Splendid Market

GREATER SUCCESS

LONG stretches of meadow land, green and fresh with the breath of the Atlantic upon it. Sprawling rivers, kissed by Carolina willows, exhaling a silent enchantment that grips the heart with its promise of peace and plenty. A country that knows only Spring; refreshed in summer by cool East winds, warmed in winter by the kindly Gulf Stream, blessed with a natural beauty that never fades. Cattle graze peacefully along the splendid roads that lead to the markets, to wide-awake towns, to excellent schools, to active churches. Rural telephone and electric lines from New Bern throughout the country. The whole is a picture of success. This is the New Bern County, whispering to you of health, of wealth, of happiness. Obey that impulse. Send your name TODAY for Interesting 36 page booklet FREE and without obligation.

s as though I'll get a calf like rs, Jack."

ack: "You'll never regret it, z."

cene III—In Katrinka's Living Room

atrinka: "Bill, Joe looks as igh he is thinking about some- g."

ill: "We farmers don't do enough king nowadays. I wish I had had education boys get today. Let's re a bit. Jack, how much did our s average apiece the year you kept a record of them?"

ack: "5,100 lbs. each for the 22 s."

ill: "How many milked less than 0 lbs.?"

ack: "The four we killed."

ill: "The second year you kept rds, we changed our feeding and like the college recommended. much did each average, Jack?"

ack: "6,600 lbs. each for the 18 s."

ill: "Let's see, this is the second in the cow testing association. much did our cows average this year, Jack?"

ack: "10,620 lbs. each. Each cow red above expenses $150 each. also sold seven calves for a good ."

ill: "Now, Joe, can you see why ays better to be a business farm- han to go by guesswork? Is 0 a month a lot for a tester?"

oe: "Bill, I'm converted. Ka- ca, get dinner quick so we can n up and go up to the county h office to get a cow record book some of those barn sheets. I want to get Boaz a few pencils a pair of milk scales. I want to the county agent about the calf and the cow testing associa- "

ill: "And, Katrinka, we'll be ng for all three of you at the meeting tonight. The dairy ialist is going to tell us how to e more money by growing le- es so as to save on feed bills."

atrinka: "I don't know what le- es are but we'll be there. I don't y have clothes to come in with we'll be there."

e: "Katrinka gets a new dress afternoon so she won't need to shamed that she's Joe Guesser's "

ll: "So long, folks. Come over visit Issie and us. Katrinka, ll want to see Issie's electric er and iron."

ck: "Boaz, you get a stall fixed hat calf."

az: "I sure will. We can get it g away by borrowing the money the bank. I'll have two years y it back." (Good-bye, etc.)

Camels bring enjoyment to living

SMOKING is one of the keen pleasures of life.

The choice of a cigarette deserves your most careful judgment because it determines the degree of enjoyment you will have. Camels welcome comparison on every count. Compare their goodness in every way. Each successive Camel brings a fresh pleasure no matter how constantly you smoke.

Such mellow mildness can come only from the world's choicest tobaccos, supremely blended, with the sole purpose of giving you, the smoker, a cigarette which you can enjoy to the fullest. The verdict of the experienced smoker is—

"Have a Camel!"

o-operative Marketing Shown By New Film

e early development and present t of co-operative marketing is ically presented in a new mo- picture, "Co-operative Marketing e United States," just released e United States Department of ulture.

is film, a contribution from the ion of Co-operative Marketing, u of Agricultural Economics, s with scenes of co-operative ac- s in pioneer days, such as barn- gs and husking bees. By means imated charts and scenes of the tions of representative associa- it brings out the gradual devel- t of co-operative marketing and resent extent of the movement. Over twenty associations in a dozen states were visited in obtaining the necessary scenes for the picture.

In addition to showing many processes in the co-operative handling of important farm crops, the film presents in a striking manner the magnitude of the co-operative marketing activities of approximately two million American farmers.

"Co-operative Marketing in the United States" is in two reels. It is the fourth of a series of educational films designed for use by co-operative associations, extension workers, and others engaged in teaching co-operative principles and practices. It differs from the others of the series in that it covers the subject in a general way rather than showing a single commodity or the detailed operations of a particular group of organizations.

Those who can use this film to good advantage may obtain it for a limited period free, the only cost being transportation charges. Requests or inquiries should be sent to the Office of Motion Pictures, United States Department of Agriculture, Washington, D. C.

Courtesy

A haughty lady had just purchased a postage stamp at a sub-station.

"Must I stick it on myself?" she asked.

"Positively not, madam," replied the clerk. "It will accomplish more if you stick it on the letter."

Sell your surplus cows, poultry and other live stock with an ad on our Special Opportunities Page.

I never dread the freshening period now—

WHAT a relief! No more troubles at calving! No sick cows from Retained Afterbirth. No losses from Barrenness due to injuries to the genital organs when lowered in vigor. No lay-off with sickness when the milk crop should be at the peak.

If you have been accustomed to leaving the health and vigor of freshening cows to chance, you know something of the troubles you can avoid by simply giving Kow-Kare two to three weeks before and after calving. The best dairymen in the country make it a regular practice—would not think of getting along without it.

Kow-Kare builds up the vigor of the digestion and the genital organs so that the unusual strain of calf-birth becomes a safe, natural process. The cow comes back to generous milk giving; the calf is a money-asset from the start. Used with unfailing results for over 30 years. A concentrated medicine that costs you nothing to use. The certain milk gain pays for it many times over.

Thousands of dairymen use Kow-Kare sparingly during winter feeding for all their cows. It helps them turn more of their heavy feeds into milk—keeps them responsive, healthy, vigorous. Kow-Kare brings back to health cows troubled with Barrenness, Retained Afterbirth, Abortion, Bunches, Scours, Lost Appetite, etc. Try Kow-Kare once and you will not keep cows without it.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Dark Calf Pens

From our own observation it would seem that the calf pen ordinarily is considered a somewhat unimportant place in the cow stable and we fancy a wide investigation would show that in perhaps a majority of instances it is otherwise than sanitary. It may be for this reason that diseases of young calves are so prevalent. Of these may be mentioned navel and joint infection, calf dysentery or scours, fits or convulsions, and ringworm. Lice are also most prevalent in dark, dirty, damp, and badly ventilated stables.

It is of supreme importance that the calf pen be roomy, clean, and light and every stable for farm animals should be well ventilated. Some breeders seem to think that direct sunlight is bad for young calves, as they keep them in a pen week in, week out, for months at a time, and in some instances calves are practically kept prisoners for the first year of their lives. If the pen is roomy, light, and well ventilated and the ration complete, the calves may not, apparently, suffer in consequence of confinement; but when the calf pen is like the "black hole of Calcutta," so to speak, the health of the young animal is sure to be impaired, robustness absent, and tendency to disease intensified. Even the pen that is fairly well lighted and that is kept fairly clean is a poor place for the young calf; for nature intended free exposure to fresh air and direct sunlight, together with active exercise on pasture. In all instances, according to our way of thinking, constant confinement in the stable is injurious to any animal and especially so to the young, growing ones. It surely lessens resistance to disease, weakens the constitution, and entails upon future herds of cattle lessened vitality, robustness, and, possibly, prepotency.

It has been thought that when sunlight was allowed free entrance, through the specified "four square feet of window glass" for each animal, germs would be killed, all of the benefit of direct sunlight obtained, and the animals therefore be enabled to grow fully, retain constitutional vigor, and escape or resist disease; but that scarcely is the case. Scientists have proved, in recent years, that the ultra-violet ray, or "tanning ray," of the sun does not penetrate glass. Sun parlors and the sunny hog houses that have largely replaced the old dark houses for swine, are comfortable on account of the heat that comes from free entrance of sunlight; but they lack the ultra-violet ray and that is absolutely necessary for the perfect development of the young animal's frame and is likewise of great benefit to every animal. It is this ray that causes lime to deposit in the bones and phosphorus to enrich the blood. It is, in itself, a remedy for rickets, when not too far advanced and provided the ration is also made complete, and is a sovereign preventive of rickets. It only has its beneficial effect when the sunlight comes into direct, untrammelled contact with the skin and that should be allowed every day when the sun is unclouded. Do away with the dark, dismal, dirty dungeon in which so many calves pass a miserable existence and are injured for life. Provide sanitary stabling and make it possible for the young animals to have a direct outdoor sun bath on every fine and at the same time take needed exercise.

For Leaking Teats

HOARD'S DAIRYMAN:—In your azine of Jan. 25, S. M. St. Kansas, asks for remedy to pr cows losing or leaking milk.

I have a fine Holstein, now 5 old, that leaked milk two seasons bad. I wished to send her t butcher, but she gave so much and losing a large part of it t could not get her in condition.

I then began to treat the teat ter each milking with a 2% sol of oil of tannin, using a small an of alcohol to prevent freezing, have no more trouble. I use a bottle with opening large enou admit the end of teat and simply the liquid against it.

Colorado. R. W. WILLOUGH

Death of Calves

We are having trouble with our calv ing, having lost four. They get a s at the navel after they are a few da Digestive system seems to be in shape. They refuse to drink after bein for a short while. Swelling is small and before the calf dies it covers alm entire stomach underneath. The las that got this trouble we opened the and it lived. About a week ago we ga barn a thorough cleaning and disinfecte a 1—40 solution of dip. A couple of da ter a cow freshened with a calf that se be a little premature and now this swelling in the same way although the was painted with iodine as soon as d This cow had a fall and we think this premature freshening. The other calve been dropped at full time.

Waterville, Iowa. W. A

Pus-forming germs and other invade the navel at birth and an abscess to form at that part secondary abscesses form in the or joints. In some instances can be little doubt that the infe has occurred before birth. Infe with the contagious abortion d is a possibility and to determin your veterinarian should the have a sample of blood from cow tested at the state exper station, veterinary departmen Ames. To disinfect the stable, a thorough cleansing, use a mi of 1 part of compound cresol tion and 30 parts of water, or of coal tar disinfectant and 20 of water. Include the floor and ters and follow disinfection b plying freshly made lime-wa every part of the stable. At saturate the navel with a 2 pe solution of mercurochrome and apply powdered starch. Repea application daily until the nav dried and shriveled. Have you erinarian give each new born hypodermic treatment with a bi antagonistic to the infection as as that can be done after birth

Impotent Bull

Could you advise me what to do or bull that doesn't serve and is lazy? every cow is coming back. He was mu ter at first and is two years old. I ha the same trouble with three bulls.

Saginaw, Mich.

Retire the bull from service f months and during that time him daily in harness, or at lea him take active outdoor ex every day. Overservice, whe young, and lack of outdoor ex tend to cause impotency. Do no bull run with the cows. Also adequate and complete feedin cluding minerals.

Impotency of Bull

Is the injury derived from serving to cows permanent to a young bull? Co with good care, be brought back to no and about what would be the required

Lavalle, Wis. J.

A young bull will be likely to er his lost "bullhood" if retired service, generously fed, and wor harness or otherwise, or at least to take active outdoor exercise

Will Anyone Accept This Pipe-Smoker's Challenge?

Wedded to one tobacco for twenty-one years, veteran defies anyone to claim longer record

Twenty-one years is a long time to stick to any one product—particularly tobacco. Because even though over a period of years a tobacco may not change in flavor or quality, a smoker's taste generally does.

So it is all the more remarkable to receive such letters as that from Mr. Roberts of South Dakota, reproduced below. Evidently, there is something about the unchanging quality of Edgeworth Tobacco that keeps a smoker's taste unchanging, too.

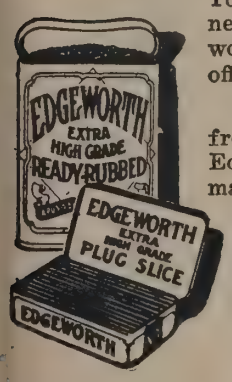
Read Mr. Roberts' letter:

Columbia, S. D.
Sept. 9, 1926.

Larus & Bro. Co.
Richmond, Va.
Gentlemen:

I am a veteran of the Edgeworth army, still in active service.

I make this claim, challenging all comers, to have smoked Edgeworth and nothing else but Edgeworth (when it was possible to get it) for a longer period than any other person within the scope of your territory.



I have smoked Edgeworth for twenty-one years and will soon start on the twenty-second.

I'll admit to having tried other brands, including so-termed high-class, high-priced blends and mixtures, enough to appreciate and satisfy myself of the superiority of Edgeworth.

In all these years I have never had one can of Edgeworth that varied in flavor or otherwise.

I can enumerate other excelling qualities of Edgeworth, but its selection above all other brands for a term of twenty-one years testifies, for my part, all there is to say for this most delicious and satisfying of all smoking tobaccos. Yours very truly,

(signed) J. J. Roberts

To those who have never tried Edgeworth, we make this offer:

Let us send you free samples of Edgeworth so that may put it to the pipe test. If you like the samples, you'll like Edgeworth wherever and whenever you buy it, for it never changes in quality.

Write your name and address to Larus & Brother Company, 15-0 S. 21st Street, Richmond, Va.

We'll be grateful for the name and address of your tobacco dealer, too, if you care to add them.

Edgeworth is sold in various sizes to suit the needs and means of all purchasers. Both Edgeworth Plug Slice and Edgeworth Ready-Rubbed are packed in small, pocket-size packages, in handsome humidors holding a pound, and also in several handy in-between sizes.

To Retail Tobacco Merchants: If your jobber cannot supply you with Edgeworth, Larus & Brother Company will gladly send you prepaid by parcel post a one- or two-dozen carton of any size of Edgeworth Plug Slice or Edgeworth Ready-Rubbed for the same price you would pay the jobber.

On your radio—tune in on WRVA, Richmond, Va.—the Edgeworth Station. Wave length 256 meters.

day. Six months of such treatment should suffice, provided the bull is not a confirmed masturbator. That vice is incurable and should be a cause for castration.

White Scours

What do you recommend for white scours in young calves?

Spencer, Mass. J. R. S.

To prevent the infectious or germ-caused form of dysentery in the newborn calf, which popularly is called white scours or calf cholera, we advise following procedure:

Provide a new, sanitary calving pen and calf pen. Keep these pens disinfected, whitewashed, and freshly bedded. At birth, immunize the calf with polyvalent calf-dysenteric serum, or use the white scour bacteria according to directions given by the maker. Also saturate the stump of the calf's navel with tincture of iodine or a 2 per cent solution of mercurochrome and then dust it with powdered starch or finely sifted slaked lime and repeat the applications daily until the cord dries up, and no raw spot remains. Feed the calf the milk of a cow that has been giving milk for some time instead of the dam's milk.

Garget

I have a 4½-year-old grade Jersey cow which freshened 3½ months ago with her third calf. She had milk fever very bad. No milk fever pump being available, a Ford pump was used and brought her through in good shape. Now about once a month one quarter gets hard and feverish for about a day or two, then goes away. Does not seem to affect either quality or quantity of milk. Could this be caused by heat periods or injury to the udder by milk fever treatment? She is giving 38 lbs. of milk daily now on alfalfa hay and commercial ground dairy feed. What treatment, if any, do you advise?

How may I prevent a return of milk fever when she freshens again? Have been advised to keep her in the barn for ten days before freshening and kept on very poor feed. Do you think that would help or should she be turned out for exercise?

Willapa, Wash. T. D. H.

The simple form of garget described may be induced by coming in heat or heavy feeding, but possibly was caused by infection at time of milk fever treatment. At times of attack strip the udder clean every hour or two during the day and in the evening rub in a mixture of one part each of turpentine and fluid extract of poke root and eight parts of lanolin, lard, or sweet oil. To prevent milk fever feed a light, laxative ration; as calving time approaches have the cow take outdoor exercise every day, and let the calf nurse for a week from birth.

Barrenness

Is there anything to be done or given to a cow to make her get in calf? I have a pure-bred Guernsey cow eight years old that calved early last May and have not been able to get her to stick yet.

Chisago City, Minn. M. M. A.

Medicinal treatment rarely helps in such a case unless the cow is very fat in which case administration of potassium iodide may prove beneficial. The dose is one dram given twice daily in water until it causes a discharge from the nostrils. When that occurs the treatment should be discontinued but may be repeated later, if needed. The cow should not be bred if she comes in heat while receiving the drug. In a majority of instances, however, infection of the lining membrane of the neck of the womb, or womb proper, is the cause of such sterility and that requires local treatment with antiseptics applied by a qualified veterinarian.

Ringworm

What should I do for my stock with barn itch? The men that take care of them have got it, too. I always whitewash my barn in the summer time.

Fort Plain, N. Y. H. G.

Isolate affected cattle and then cleanse, disinfect, whitewash, and properly light and ventilate the stable. Ringworm or "barn itch" is caused by a vegetable parasite that lives on damp woodwork and walls as well as on the skin. The disease is communicable to man. Treat by saturating the spots with oil until the scabs or crusts can be removed without drawing blood. When that has been done apply strong iodine ointment upon and around each spot. Do that two or three times daily for two or three days, and then apply the ointment as often as is seen to be necessary. Bathe spots around eyes with a solution of hypochlorite of soda ("B-K"). If many cattle have to be treated it will be cheaper to wet the sores on the neck, body, and legs with a solution of 4 ounces of bluestone per pint of hot water. Apply it at intervals of 6 or 7 days.

Tuberculin Testing

I am writing you for information in regard to T. B. test on cattle. Is it possible that a cow badly infected with T. B. may not react to, say, the intradermic test, which is now mostly used, and remain in the herd and continue to be a "spreader?"

Would it be advisable to apply a combined test to such suspicious cases?

Davenport, Ia. O. R.

It is possible for a cow to be so saturated with the poisons of tuberculosis infection that she fails to react to the subcutaneous or thermal tuberculin test, but she would be much more likely to react to the intradermic test.

In all retests and "suspicious" cases it is best to combine any two of the three standard methods of tuberculin testing.

"Give me a round-trip ticket."
"Where to, please?"
"Back here, you loon."

More Milk Guaranteed

Leaving the health of the cow's udder and teats to chance is like milking into a leaky pail. The slightest injury to these delicate tissues means sure milk loss.

Let Bag Balm be your guarantee of a full, easy milking. This marvelous penetrating ointment quickly heals any cracked, chapped, injured teats. Inflammation or injuries to udder or teats is reduced almost at once, the tissues restored to normal action. This great healer is surprisingly effective in treating Caked Bag, Bunches, Cow Pox. It is compounded especially for use on the udder and teats, but has hundreds of healing uses on the farm. Clean, pleasant odor; cannot taint the milk.

Feed dealers, general stores and druggists have Bag Balm, in the big 10-ounce package for 60c. If you have trouble getting it order from us.

Booklet, "Dairy Wrinkles," free.

DAIRY ASSOCIATION CO., Inc.
LYNDONVILLE, VT.

Wisconsin Jersey Meeting

At the recent meeting of the Wisconsin Jersey Breeders' Association, Professor G. C. Humphrey advised the Jersey breeders to organize their forces for a definite program in order that Wisconsin may continue its pace at the head of the dairy industry. F. B. Astroth of the American Jersey Cattle Club advocated a breeder's code of ethics.

It was again voted to offer a trophy to the Jersey herd of at least ten cows that makes the highest herd average in a Wisconsin testing association during the year 1927.

Officers for the following year are: Glen W. Vergeront, president; G. B. Reedal, vice-president; A. F. Block, secretary and treasurer.

Wisconsin. G. W. VERGERONT.

B. B. SIMMONS & SONS, PEWAUKEE, WIS.

WITH THIS END IN VIEW

— You Can't Resist the Ayrshire!

For the "business end" of the Ayrshire is a model of beauty and usefulness. — A long, level rump, clean-cut thighs, sturdy feet and legs, and an udder with every ideal characteristic are constantly before those farmers fortunate enough to have this end in view.

These farmers have learned that Ayrshire udders are built to produce and wear for the life of the cow. With ample size, perfect shape and strong attachments, Ayrshire udders also possess that mellow, elastic quality that means heavy production year after year.

With This End In View The Ayrshire Is The Most Profitable Cow

Write for booklets or let us help you get a foundation.

Shoveling Snow With a Scythe —

There's a man in your neighborhood who is trying to make a few dollars by milking a few cows. Ordinarily, his intelligence is above the average, he is a hard worker, and he tries to be a good farmer, but—

He's just neglected to consider the business side of dairying. He still uses a scrub bull, and he doesn't keep record on his cows. He might just as well try to shovel snow with a scythe. We could tell him about some farmers who are making *real profits* from Guernseys. Tell him to write for

"THE STORY OF THE GUERNSEY"

THE AMERICAN GUERNSEY CATTLE CLUB
8 Grove St. — PETERBORO, N. H.

High Grade Dairy Cows

The Chicago Dairy Cow Exchange is offering at private sale high class dairy cows, mostly Guernseys and Holsteins. Most of them are fresh or springers. These cows come direct from herds in accredited counties, from accredited herds, or herds that have passed at least one clean test.

When you are in the market for healthy, profit producing, cows, come to the "Exchange." Write us today for complete information.

CHICAGO DAIRY COW EXCHANGE
Reid Murray, Manager — Union Stock Yards, CHICAGO, ILLINOIS

MARSH FARM GUERNSEYS

Founded upon CHERUB blood, combining modern show type with production. At the last 13 National Dairy Expositions 46 out of 78 championships have been awarded to cattle from this farm. There are now in the herd 40 cows with yearly records of 500 pounds of fat in Class G. to 900 pounds of fat in Class A. In your efforts to improve the type of your cattle, the show ring records indicate Cherub blood as the really sure way. Let us advise you about your next sire.

Waukesha County Guernsey Breeders' Association

SALES PAVILION

MARCH 23d, WAUKESHA, WIS.

It has always been our aim to select animals with quality that are pleasing to the eye and good producers. We have various ages to offer which are the result of years of careful breeding by reliable breeders.

In selecting the largest number of animals we have ever offered at one time, we assure you we had profit producers in mind at the time of inspection. We have cows fresh and due to freshen soon, yearlings and two-year-olds, choice heifer calves very suitable for club work, and a few choice males of serviceable age.

Following are a few of the many good Females:

Imp. Modesty of Edgemoor A. R. record of 504 lbs. fat in Class GG.
Sunny Slope Pearl Rose whose dam has 745 lbs. fat.
Rosemary of Maple Hill whose dam has 618 lbs. fat.
Muskego Merry Maid, a daughter of Itchen May King, Grand Champion, National Dairy Show. Dam has 608 lbs. fat.
Peggy of Gordondale, A. R. record of 531 lbs. fat at 3 years.
Daisy's Rosalla. Dam has 612 lbs. fat.
Royal's Duchess of Maple Hill, A. R. record of 572 lbs. fat.
New Hope Cherub's Susan, dam has 564 lbs. fat, and bred to a bull whose dam has 900 lbs. fat.
Three daughters of Dairymaid's Criterion of Iowa out of high record cows.
Beauty's White Face of Maple Heights, 1st Prize in 1926 at seven of the leading state fairs and dairy shows.
Anna Laura's Glenwood Girl, a very beautiful cow fresh at sale time.

A Few of the Males:

Danny's Glad Lad of Fern-Dell, 1st Prize at 2 leading shows in 1926. Dam has 700 lbs. fat.
Tillybardin Topsy Boy, dam has 605 lbs. fat, and sire's dam 629 lbs. fat.
Cora's Cherub of Shorewood, whose sire is Ladysmith Cherub, dam has 734 lbs. fat Class AA.
Kate's Alvin whose 6 nearest tested dams average 605 lbs. fat.
Aralia's Girl's Prince, sire's dam has 614 lbs. fat and dam has 551 lbs. fat.

All animals are tuberculin tested, ready to ship anywhere. If you are interested in Guernseys, this is your opportunity, and you cannot afford to miss this sale.

Wisconsin Holstein Sales Ass'n

15 Leading Holstein Counties Cooperating

600
Registered Holsteins

To be sold the second and third weeks in April

Beginning April 12

THE SOUTHERN DIVISION of this cooperative sales series is supported by breeders from Jefferson, Rock, Dane, Iowa, Sauk, Columbia, Juneau, and Richland Counties.

THE NORTHERN DIVISION is supported by breeders from Fond du Lac, Washington, Sheboygan, Manitowoc, Wood, Marathon, Taylor and Clark counties.

SALES POLICY—To consign a better class of cattle than is ordinarily consigned to county sales; to pool the advertising strength of these sales into one campaign and to so conduct these sales that they will be a constructive advertising force for the counties supporting them.

WISCONSIN HOLSTEIN BREEDERS are convinced that the county sale must be supported because it is the most helpful agency in building a permanent market for the county.

THE ADVERTISING STRENGTH of such a cooperative effort justifies breeders to consign a better class of cattle than he would be justified to consign to the single county sale.

THEREFORE THE BUYING PUBLIC will have a practical line up of cattle to select from—the kind that develops and proves out in a satisfactory manner.

These sales will be held at different places on succeeding days throughout the second and third weeks in April.

For specific information regarding this sales series and for an illustrated folder, write

SMALL ACCREDITED HOLSTEIN HERD

OFFERED AT PRIVATE SALE!

Dissolution of partnership makes it necessary to offer one of our herds for sale. It includes 26 registered Holsteins,—8 cows, 5 to 7 years old; a 4-year-old; three 3-year-olds; eight 2-years-olds; 4 yearlings; one heifer calf and one bull calf. The 8 cows and one 3-year-old are bred to Sir Ormsby Skylark Pontiac Segis, a 37-lb., 1,199-lb. grandson of Duchess Skylark Ormsby and King Segis Pontiac. The others are sired by him and bred to Sir Longfield Neeltje Segis, an excellent 30-lb. bull with good year record backing. Herd is accredited and free from abortion. This is an opportunity to buy what you want, one or a carload. Write or come to the farm.

C. A. SCHROEDER & SONS — WEST BEND, WISCONSIN

5 Registered 2-year-old Heifers

Because our barns are over crowded we are offering 5 registered 2-year-old heifers, bred to freshen March 25 to June 30. Heifers are by a sire from a 982-lb. 3-year-old and their dams are by a 33-lb., 1,287-lb. bull. Their dams have C. T. A. records from 323 lbs. fat to 576 lbs. fat. Our herd averaged 355 lbs. fat, 3.99% test in C. T. A. in 1925; 373 lbs. fat, 4.01% test in 1926. Herd is federal accredited.

We will help any buyer secure more heifers from neighboring herds if desired. Write us today.

H. E. REDDELIEN & SON, — Oconomowoc, Wisconsin

EAR TAG 3105
Born June 24, 1926

THIS SHOW BULL FOR SALE

The sire is closely related to Bess Johanna Ormsby (the only 4 times 40-lb. cow) and the dam is a granddaughter of King of the Ormsbys (102 A. R. O. daughters). She made 18.56 lbs. butter in 7 days at 2½ years and is still under semi-official test, making 350 lbs. in 188 days. First check for $200 takes him.

WINTERTHUR FARMS, — Winterthur, Delaware

High Grade Holstein Springers

Mention Hoard's Dairyman to Your Dealer—It Helps Us

AGAIN — We Offer a Son of Sir Inka May

Again we have a son of Sir Inka May old enough to ship. This one (No. 1895), born August 19, 1926, is exceptionally promising, in fact you can figure on showing him next Fall.

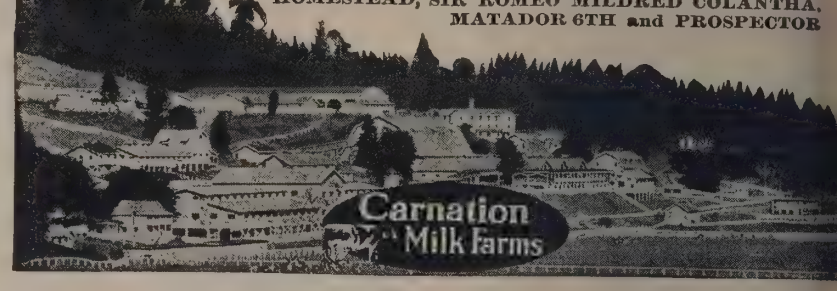
His Two Nearest Dams Average —

Butter 365 days . . . 1214.18
Butter 7 days 35.36

His dam, a cow with a splendid udder, is a big, fine, straight cow that has two records over 33 pounds and one over 35 pounds..

She is a cow that transmits type and production, with three good producing daughters. Her other son sold at the National Sale for $1500.

She has a year record of 905 pounds of butter from 21,296.7 pounds of milk. Her dam is a 28 pound daughter of Sir Skylark Ormsby Hengerveld. Her sire has a 1000 pound sister, a 33 pound dam, and 3 daughters from 32 to 35 pounds.



THIS IS ONE OF THOSE EXCEPTIONALLY DESIRABLE BULLS THAT WE PROMISED TO OFFER THIS YEAR. YOUR OWN GOOD JUDGMENT WILL TELL YOU THAT THERE WILL BE FEW OPPORTUNITIES TO SECURE A BULL LIKE THIS

HOLSTEINS

—Producers of Cash!

Holsteins stand supreme as butterfat producers. Holsteins in most instances are leaders in cow testing associations, both in individual and herd records. Under official test the important records for butterfat are all held by Holsteins. Their ability to produce butterfat, milk and calves economically, make them consistent producers of cash.

Wonderful New Milking Method

Milks Cows Like No Other Machine Ever Milked Cows Before

At last something new HAS happened in the history of machine milking.

The wonderful Surge Milker has changed all old ideas of what a milking machine ought to accomplish. You cannot judge this machine by anything you ever knew of milking machines in the past. Breeders who used to be afraid to put a machine on their record making Pure Breds are using The Surge. They tell us they are making wonderful records—and the udders have never been kept in better condition by the most careful hand milking.

Dairymen producing for city milk trade who couldn't make pure, clean milk with old type machines are earning premiums for low bacteria counts—and spend no more time washing The Surge than they used to spend washing milk pails.

The Surge is sweeping everything before it. It is the greatest thing that has happened in the dairy industry in many years.

Only These 4 Rubbers To Wash

Think of that! You men who have TRIED to keep old fashioned milkers clean. Only these four simple pieces of rubber to wash. NO long tubes. NO claws. NO places for the milk to lodge and breed bacteria. Only 20 seconds to take machine all apart—30 seconds to put it together. So easy to wash that you don't mind it after every milking. That's why it's easy to make Grade "A" milk and sell it at premium prices.

4 ft. or 4 inches

Which would you rather wash? That's not very hard to figure out. No indeed—and that's the *big* reason why The Surge is *so easy* to clean and keep clean. Result: Clean milk — premium prices — no drudgery.

HOARD'S DAIRYMAN

A JOURNAL DEVOTED TO DAIRY FARMING

Volume 72, No. 6 Fort Atkinson, Wisconsin March 25, 1927

Ford owners pleased! The improved Mobiloil "E" gives a double surprise

When the improved Mobiloil "E" was announced, some asked, "But in getting the new smoothness in starting and stopping, how can you retain the unusual freedom from carbon which we have always found in Mobiloil 'E'?"

Our reply was, "That has been our chief concern. That is why we waited years to change Mobiloil 'E.' Ingredients used in many Ford lubricants to provide easier starting have resulted in extra carbon and valve troubles. It was only after years of experimenting that we got the two results: Real freedom from jerky starts and stops *plus* real freedom from carbon."

Today's Mobiloil "E" is cheaper than ever to use. Here is why—

By increasing the life of transmission bands you postpone the expense of replacement. That's saving number one. By cutting down carbon deposits you pay for fewer carbon removal jobs. That's saving number two. Nor is that all.

The improved Mobiloil "E" splashes freely in the Ford lubricating system. It reaches all engine, clutch and transmission parts where protection is vital. And today's Mobiloil "E", due to its clinging, resisting character shows remarkable economies. Less wear. Fewer repair bills. More power. A sweeter-running Ford engine.

And due to the great "wearing" qualities of Mobiloil "E" you will use less oil.

Four quarts to prove it

Mobiloil "E" will cost you less to use than other oils despite the fact that Mobiloil "E" costs 5 cents more per quart. Four quarts, a Ford crankcase full of the genuine Mobiloil "E", will prove this to you.

After you have once tried the improved Mobiloil "E" you will want to keep a supply on the farm. A nearby Mobiloil dealer has Mobiloil "E" in various sized cans and drums. Each container offers real economy and convenience in handling oil.

The year around use Mobiloil "E" in your Ford car and Ford truck. In your Fordson tractor use Mobiloil "BB" in summer and Mobiloil "A" in winter. Ask the Mobiloil dealer what grade of Mobiloil to use in cars, trucks and tractors of other makes. All Mobiloil dealers have the complete Mobiloil Chart of Recommendations.

GARGOYLE

Mobiloil "E"

Corn Borer Campaign Plans

A provisional program for the $10,000,000 campaign for the control of the corn borer recently authorized by Congress was outlined last week at a conference of representatives of five state departments of agriculture, of extension divisions of the state agricultural colleges, and the United States Department of Agriculture, called by the Secretary of Agriculture. The act authorizing the campaign provides for control work in New York, Pennsylvania, Ohio, Michigan, and Indiana. It is estimated that a corn acreage of 2,500,000 acres in between 300,000 and 400,000 farms in these states will be included in the clean-up.

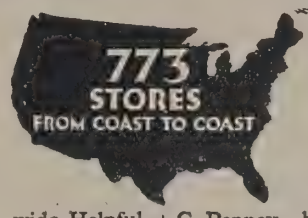
The appropriation will become available as soon as necessary legislation now pending in the legislatures of the five states affected gives the state departments of agriculture the necessary powers of quarantine and compulsory clean-up required, together with authority to delegate such powers to the federal workers employed under the act. When this state legislation has been passed, steps will be taken immediately to put the federal regulatory organization in the field and begin the inspection of individual farms in the control area. The inspectors will notify farmers of the necessary measures which they must take, according to the provisional regulations adopted by the conference of state and federal workers.

These regulations require the burning or satisfactory destruction of all cornstalks, remnants of stalks and corn cobs either in the fields, the feed lot, the barnyard or around canning factories and other process agents, unless ensiled or shredded. The corn fields must either be plowed to such a depth that no stalks, pieces of cobs, or other corn remnants appear on the surface when it is plowed, disced, harrowed, planted, or cultivated, or, if not plowed, the fields must be cleared by pulverizing all corn remnants. It is expected that individual farmers voluntarily co-operating in the clean-up will take these necessary measures by May 1. Following May 1, all infested farms will be reinspected. If reported as meeting all requirements as to control measures, the individual farmer will be reimbursed not to exceed $2.00 an acre for field corn and not to exceed $1.00 an acre for sweet corn on which he is obliged to undertake operations in addition to those normal and usual in farm operations at this season.

Where the regulations have not been complied with either intentionally or unintentionally, the federal regulatory force under the authority of the state department of agriculture will conduct the necessary clean-up with its own special machinery and crews. The farm cost of such enforced clean-up will be charged to the individuals on whose farms the work is done and will be collected on the same basis as taxes by the state authorities under the authority which the state legislation now pending will give them. The funds collected in this way by the state authorities which represent expenditure of federal money will be turned over to the United States Treasury as provided for in the federal act and pending state legislation.

Prior to May 1, according to the provisional program, the federal forces will also give a large number of local field demonstrations in the selection and operation of machinery most effective in borer control work as part of an intensive educational and publicity campaign to be put on in co-operation with the Department Extension Service, the extension divisions of the state agricultural colleges, and county extension agents. This supplementary campaign will consist of holding educational field meetings, the organization of county and local committees in the interest of voluntary clean-up of the borer, supplying information to the press and other news agencies, and the distribution of educational material through the extension forces.—U. S. Department of Agriculture.

J.C. PENNEY CO. A NATION-WIDE INSTITUTION



A small dry goods, shoe and clothing store was opened in a small town in the west, serving a few hundred homes.

The one small store has grown into a Nation-Wide Institution of 773 Department Stores serving millions of homes.

FROM ACORN TO OAK

After 25 years of growth now a nation-wide shopping service

WE are celebrating with pride and thankfulness our Twenty-fifth or Silver Anniversary—with pride for the privilege of serving the American public—with thankfulness for the generous response that has come to our effort.

Since the Spring day in April, 1902, when Mr. Penney inaugurated, in a small and inconspicuous manner, a Retail Shopping Service which was destined to become one of Nation-wide Helpfulness, a quarter of a century has passed.

It has been a period of notable growth and expansion, of winning millions of friends, of serving them faithfully, of basing achievement upon the good will of mutual satisfaction.

During all these eventful years, we have been mindful of our responsibilities to the legion of patrons who have contributed and are today contributing, so continuously and so generously, in helping make our Service one not of profit alone but of the confidence that rests on good will.

Never for a moment have we knowingly wavered from the responsibility of this relationship. It has always been to us an inspiration to reach out for greater things, that we might be the better prepared to render a Service which should prove to be more and more beneficial to the increasing numbers who come to us.

Not only is that one little Golden Rule Store of 1902—now itself grown to far larger proportions—still serving the people in and about Kemmerer, Wyoming, but there has sprung from its applied principles and policies, others to a present total of 773 Department Stores, scattered over 46 States.

All these are children of what we now affectionately term, The Mother Store; all happily operate in the Service of the public under the name of the J. C. Penney Company. The Founder of this Organization—Mr. James C. Penney—builded in his pioneering days more enduring and substantially than he knew.

His ideals and practices—square treatment alike to all always—and the extent to which he packed Value into every Dollar of purchase—these constitute the pattern according to which this enormous business has been shaped and which has caused it to grow until it has now become a Nation-wide Institution, serving more than 3,000,000 homes.

The dynamic selective and buying power of the Company created by its tremendous volume of cash sales, which, in 1926, amounted to $115,682,737.86, gives *a saving power to the public* which means much to the thrift and to the economic life of the people of every community where it operates a Store.

At this milepost in our history, we pause only long enough to express our thanks to the great American people for their continued confidence and appreciation of our efforts in their behalf and to offer the assurance that in the future as in the past we shall strive to serve not only well but better and better with each succeeding business day.

OUR ANNIVERSARY CELEBRATION BEGINS APRIL FIRST!

RETAIL SALESMEN WANTED
experienced in our lines, to train for Co-partner Store Managers, providing for the continuous growth of our Company and especially the expansion planned for 1927. Write for particulars.

Fern's Wexford Noble Dies

Fern's Wexford Noble, the undisputed champion show bull of the Jersey breed, died at Twin Oaks Farm, New Jersey, recently. This sire whose perfection excited the admiration of every lover of good live stock, died of a disease known as osteomalacia, or "brittle bone." This disease was due to the inability of the animal to absorb enough mineral matter to supply the requirements of its body.

Wexford was just eight years old at the time of his death. He was grand champion at the National Dairy Show for three years in succession—1922, 1923, and 1924. His sons, Fern's Rochette Noble and Oxford Wexford Noble, were grand champions in 1925 and 1926. His get was first in the get of sire class at the 1925 and the 1926 National.

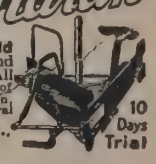
Wexford's Modest Joy, the oldest daughter, has just completed an official test in which she produced 800.85 lbs. fat and 13,471 lbs. milk. This is a senior four-year-old state record for New Jersey. A number of other daughters now on test will make very good records.—The American Jersey Cattle Club.

Vernon County Guernsey Meeting

The annual meeting of the Vernon County Guernsey Breeders' Association held Feb. 19, at Viroqua, Wis., brought out a good attendance. It was voted to deduct one per cent of the receipts of the spring sale for association work, and plans were made to hold the summer meeting at the county fair ground. The program included interesting talks by E. J. Schilling and Mrs. Bertha Lauder.

JANE BECK, Secretary.

NEW! LOW MODEL MELOTTE



NOW—for the first time, the farmers of America have a chance—*if they act quick!*—to see and USE on 30 Days' FREE Trial, the NEW Low Model Belgian Melotte Cream Separator. In the NEW Melotte you NOW have a greater convenience and all-around satisfaction than was ever known before.

Don't Pay for 4 Months

Yes, you need not pay one cent for 4 Months after you receive the NEW Melotte. Special Introductory Low Price RIGHT NOW! 30 Days' FREE Trial. Write for FREE Book and Special Offer.

BUICK

Recommended by - - - more than *a million*

IF the opportunity presented itself, more than a million Buick owners would recommend this car to you. And they would tell you reason after reason why they buy Buicks whenever they need new cars.

They know the excellence of the Buick Valve-in-Head engine—today *vibrationless beyond belief.*

They know a driving ease which makes other cars feel inefficient. A Buick starts smartly, even in zero weather—parks and unparks handily—steers with no effort at all.

Another Buick advantage is Service. There are 4000 Buick Authorized Service Stations, to safeguard Buick performance all over America.

Let the supreme confidence and the outspoken enthusiasm of Buick owners be your guide to satisfaction. Buy a Buick!

BUICK MOTOR COMPANY, FLINT, MICHIGAN

DAIRY PRODUCTS VERSUS COTTON

HARRY B. TABER, ARKANSAS

)LACE your finger anywhere on the map south of the Mason and Dixon's line; then go from ere to the county seat of whatever unty you have haphazardly home-eaded. You will find that county cing a "cotton crisis." You will so find the farmers aroused at last id changing their schedule for next ar, with cotton marked "One-half ff." And we do not believe the rmer will change his mind next ring—not this time.

We have selected Faulkner County ecause it is a typical cotton county the typical cotton state of Arkan-s, and it will reflect conditions as ey are today in 9 out of 10 of all e counties in all southern states. long with the rest of the South, aulkner County has gone "over the p" in cotton production this year, id the market has slumped to 11 or ? cents. Various other lines of rming have been suggested the past veral years. Some of them have en adopted by the more progressive rmers. Quite a few farmers last ar cut their cotton acreage, and cceeded well with radishes, sweet tatoes, melons, and milk cows.

It is with the last item this article chiefly concerned as an ideal sub-itute for a money crop. The aulkner County Co-operative Dairy ssociation has been in active oper-ion for several years and has built a splendid dairy product business. has secured regular outside mar-ts in nearby towns and cities. Its arket is steady the year round at ry good prices. Here, then, is mething tangible for the cotton rmer to grasp. All he has to do is get some good milk cows and care r them right. His market is at his or. No waiting a year to get his oney, or to find out that he isn't ing to get it.

What is true in Faulkner County just as true anywhere else in the uth where there is a good, live co-erative dairy association.

A visit to the milk and cream plant of the Faulkner County Co-operative Dairy Association, after a prior visit in the summer of 1921, would be an eye-opener to even a casual observer. Beginning the dairy business five years ago last April, R. L. Folts, practical farmer and expert dairyman, and several others opened a milk station in a small frame building on the outskirts of town. Mr. Folts smiled when asked if he remembered the output of milk at that time.

"Not hard to remember," he said, "we had just four cans of milk the first morning. But we are doing a little better than that today."

"A little better" to the tune of 10,000 lbs. of sweet milk per day, besides about 220 gallons of sour milk. And this does not nearly meet the growing demand. The plant now supplies several chain stores and ships to 6 or 7 towns in the state daily, with still others calling for milk they are unable to supply.

The Faulkner County Co-operative Dairy Association began with 10 members—today it numbers 140 members. Two years ago the business went entirely beyond the capacity of the first little building and equipment. In fact, Mr. Folts and County Agent W. L. Hall both agreed that to meet the demands of the trade a larger, better building was needed, and also modern equipment that would permit the association to put up and handle its own products. County Agent Hall and Mr. Folts are both former Wisconsin farmers and dairymen, and knew the best type of construction and equipment. Under their direction the association erected a modern dairy plant about a stone's throw from the paved highway leading to Little Rock, a city of some 75,000, one of their best markets. Over this highway the plant now operates two milk trucks daily.

The new building and equipment cost around $12,500, largely paid out today by a part of the profits of the business. All the machinery is modern, operating by electricity.

In the first few months of the business, operating as a milk station, shipments were confined to whole milk, going to the Little Rock market. Later, and in the last two years especially, the plant after changing to the new location has gone in for high grade cream for the ice cream trade and manufactures a splendid grade of butter. The butter has been given the name "Wonder State" and it finds a ready sale anywhere. Some 700 to 800 lbs. are shipped daily.

At Guy, a settlement in the northern part of Faulkner County, a meeting of some 100 farmers was held recently. The purpose of the meeting was to start dairy farming and stop cotton farming. At this meeting County Agent Hall, Mr. Folts, Mr. T. M. Williams of the Conway Chamber of Commerce, and Herbert Maddox, representing the Farmers' State Bank of Conway, were present and addressed the meeting. Mr. Maddox told the farmers that his bank stood ready to advance them the money to buy good Jersey milk cattle to get their start with, and arrangements were also made to truck the milk to Conway. This meeting was the result of the low price of cotton, in a way, and is a part, too, of a five-year campaign now under way by the Conway Chamber of Commerce to help the farmer get away from raising cotton and into a more stable and profitable business.

Mr. Folts stresses the fact that for the farmer to get the best profits he should raise practically all his own feed. He advises no farmer to enter the dairy business unless he raises all the leguminous hays for his cows, and also provides plenty of pasture for them. If the farmer is in earnest about quitting cotton, or cutting the acreage of cotton materially, he can without doubt manage this feeding and pasture. Mr. Folts favors the Bermuda grass pasture as the best permanent pasture in the South. It is capable of keeping up more cows per acre, and is a good milk producer when properly balanced with other feeding. He advises sowing Japan clover on the Bermuda in the spring, and burr clover in the fall, about September or October. With the Bermuda grass, which corresponds to the Buffalo grass of the North, as a base, the Japan clover gives an earlier pasture in the spring, and the burr clover a later one in the fall, and altogether furnish much better pasture than any one of them alone.

With the banks ready to help him, and the association prepared to handle his products and give him an unlimited market right at home, the Faulkner County farmer should not hesitate in making his choice between cotton and milk cows for 1927. And many other southern sections offer the same opportunity.

R. L. FOLTS AND HIS ARKANSAS HOLSTEINS

Mr. Folts was largely responsible for the initiation and successful outcome of the Faulkner Co-operative Dairy Association.

WHENCE ALL BUT HIM HAD FLED"

A typical hillside cotton field in Faulk-er County, Arkansas. The cotton is gone nd no profit, but this farmer is using is cotton mule to mark off terraces, and ill use the fertilizer from his dairy barn o build up the soil and put it in some-ning different next year—not cotton. He ade six bales of cotton, but his six dairy ows and his corn and potatoes saved the ay.

NEW PLANT OF THE FAULKNER COUNTY CO-OPERATIVE DAIRY ASSOCIATION

JERSEY CATTLE IN THE UNITED STATES

THE Jersey breed originated on the Island of Jersey, the largest of the group of Channel Islands which lie between England and France. The exact origin of the breed is unknown but it is probable that it is descended from cattle native to the nearby coast of France. It came from the same foundation stock as did the Guernsey and at one time the two breeds were together known as Alderneys.

Realizing the importance of preventing a further introduction of outside blood if their cattle were to be considerably improved, the residents of the Island in 1879 passed a law preventing the importation of cattle into Jersey except for immediate slaughter, and no outside blood has been introduced since that time. At about the same time the cattle on that island became known as Jerseys instead of Alderneys. According to Plumb, the improvement of Jerseys really began shortly after 1800. In 1833 the Royal Jersey Agricultural Society was organized and the following year it originated a score card for Jerseys with a total of twenty-five points for the bull and twenty-seven points for cows. This card was used at the first island show which was held in 1834.

POGIS 99TH OF HOOD FARM, LEADING REGISTER OF MERIT JERSEY SIRE WITH 115 R. OF M. DAUGHTERS

Importation and Distribution

The first importation from the Island of Jersey to America was made in 1850 by Taintor, Buck, Norton, and others living in Connecticut and thereafter there were fairly regular importations which became more numerous after 1870. Since 1890, many Jerseys have been imported every year. The number of imported animals registered since 1904 is 7,642, an average of nearly 350 annually.

Jerseys are more evenly distributed in the United States than is any other breed. According to the 1920 government census there are about 232,000 registered and 9,300,000 grade Jerseys well scattered throughout all the 48 states, nearly 41% of the cattle in this country that are of any of the recognized dairy breeds.

General Characteristics

The Jersey is the smallest of the major dairy breeds. The calves weigh from 40 to 75 pounds at birth. The heifers develop rapidly and mature sufficiently to drop the first calf at 24 months of age. The mature cows weigh from 700 to 1,200 pounds, averaging about 900 pounds, and the bulls weigh from 1,200 to 1,800, averaging about 1,500 pounds.

The color of Jerseys is usually some shade of fawn or cream color, though different shades of mouse color, gray, and brown are common, and some individuals approach black. They may be solid color of any of these shades, or spotted with white. The muzzles and tongues are usually black or lead colored, but light-colored tongues are not uncommon; and around the muzzle is a white or mealy ring.

Production

Jersey milk carries a high per cent of butterfat, the average test for all 365-day R. M. records being 5.364%. During the period from 1902 to 1925 inclusive, 19,742 365-day Register of Merit records were made, their average being 8,698 lbs. milk, 466.5 lbs. butterfat. Approximately two-thirds of these records were made in heifer form. Up to August 1, 1926, eighteen Jersey records above 1,000 lbs. of butterfat have been made in the United States. Three records above 20,000 lbs. milk have been made.

Scale of Points for Jersey Cow

Dairy Temperament and Constitution

Head, 7—
- A—Medium size, lean; face dished; broad between eyes; horns medium size, incurving 3
- B—Eyes full and placid; ears medium size, fine, carried alert; muzzle broad, with wide open nostrils and muscular lips; jaw strong ..

Neck, 4—
- Thin, rather long, with clean throat, neatly joined to head and shoulders .....

Body, 37—
- A—Shoulders light, good distance through from point to point, but thin at withers; chest deep and full between and just back of fore legs ..
- B—Ribs amply sprung and wide apart, giving wedge shape, with deep, large abdomen, firmly held up, with strong muscular development .....
- C—Back straight and strong, with prominent spinal processes; loins broad and strong .....
- D—Rump long to tail-setting, and level from hip-bones to rump-bones .....
- E—Hip-bones high and wide apart .....
- F—Thighs flat and wide apart, giving ample room for udder ....
- G—Legs proportionate to size and of fine quality, well apart, with good feet, and not to weave or cross in walking .....
- H—Hide loose and mellow .....
- I—Tail thin, long, with good switch, not coarse at setting-on .....

Mammary Development

Udder, 26—
- A—Large size, flexible, and not fleshy
- B—Broad, level, or spherical, not deeply cut between teats .....
- C—Fore udder full and well rounded, running well forward of front teats ..
- D—Rear udder well rounded, and well out and up behind .....

Teats, 8—
- Of good and uniform length and size, regularly and squarely placed .....

Milk Veins, 4—
- Large, long, tortuous, and elastic, entering large and numerous orifices ....

Size, 4—
- Mature cows, 800 to 1,000 lbs. .....

General Appearance, 10—
- A symmetrical balancing of all the parts, and a proportion of parts to each other, depending on size of animal, with the general appearance of a high-class animal, with capacity for food and productiveness at pail ....

Total score .....

Scale of Points for Jersey Bull

Head, 10—
- A—Broad, medium length; face dished; narrow between horns; horns medium in size and incurving .....
- B—Muzzle broad, nostrils open, eyes full and bold; entire expression one of vigor, resolution, and masculinity ..

Neck, 7—
- Medium length, with full crest at maturity; clean at throat .....

Body, 57—
- A—Shoulders full and strong, good distance through from point to point, with well defined withers; chest deep and full between and just back of fore legs .....
- B—Barrel long, of good depth and breadth, with strong, rounded, well-sprung ribs .....
- C—Back straight and strong .....

The Log of Their Keeper

JAMES G. BEATTIE, WISCONSIN

EBRUARY 2. Kidney saute for dinner, oxtails yesterday, kidneys the day before that, and tails tomorrow. Made new rope lters this afternoon, and tonight ong and I had our trading clothes again. Wong loves tobacco and I e rice. A grapefruit, dropped on

THE BARREN COAST OF CHILE

deck of the Humming Bird, would rt a riot.

ebruary 3. Another day, another lar. Nothing has happened, just usual routine. Destination, one nearer. We had oxtails for akfast, oxtail salad for dinner, oxtail patties for supper.

Wong says: "Alle same oxtail, alle ue. No eat, no good. Naw, no d. Good for sick dog, make him ier." Then Wong laughs good.

have guests, quite a good many, n I milk. They mostly have hers, coffee pots, and little pails. dy comes too, he likes new milk.

ebruary 4. In spare time I try to e the mysteries of the Spanish mmar. Learned the cardinal numbs in no time, and the names of s and months. And the prepositis and interjections. But the os! In front of their citadel I e had to stop and dig trenches. y are a bird of a different color, a l of white robin with blue breast, the secret of them is to know the ings. Whether Don Gomez has by the throat or in the o breaking out vintage of ripe age, you must get the terminas just so, or he is liable to con- e an encomium for an insult.

he gulls have left the Humming Bl. A good many think it was the il patties. Sailors say when they a feed of rank meat they mark h ship and quit it. Maybe their c is "fishy," but the fact of the ter is, the gulls are assembled y around the Turpin, a German , also in here discharging cargo. onight, the second mate, saloon sman, an assistant, two sailors, n an oiler mingled together amidh and told stories until midnight. se fellows, all addicts of the sea, r gentlemen and hard workers, e saving their earnings and others ndering them. Reminiscences, and all but forgotten, were resurrected there for another dusting, and from every port and inlet of the world that ships sail they came. Between them, they have been in every land, in every sea and clime; the carpenter, for instance, having had a narrow escape in Yokohama, September, 1923. These fellows are rich with color, life, and travel, and it is unfortunate indeed that they have not the gift to paint them in ink for others' duller hours.

February 5. At 4 a. m. I reached to the region of my feet for a blanket. The air is cool. By and by I hear Wong shuffling along the companionway with his dilapidated old sea-slippers, humming a Chinese chanty and strumming discordant on a bread-pan. He starts the day at 4:30, not just this day, but every day. Wong is a sun-of-a-gun to work; so is Wing, the second cook. The fact that they are is conclusively proven when you sum up all they do in a day in the way of preparing the grub for 45 men. Whatever may be said about these Chinamen, there is one thing they cannot be accused of, and that is laziness. When I arise, 30 minutes later, Wong is heading for the galley with the bread-pan running over with kidneys, so from that one might infer that we will have kidney saute for dinner.

With our position the same these days, the firemen have an easy time. The oilers have some work to perform, helping the engineers who are always busy. And like the engineers the sailors always have something to do. They have many a wire rope to splice on a voyage, and splicing wire rope is strenuous labor. It is their duty to keep a stock of slings on hand for the stevedores, and keeping the rigging and booms and blocks and tackle in working order is their job. Then there is chipping and painting and a dozen other jobs that depend on them.

February 6. Nile Boklund and Julio Ginocchio, firemen on the Humming Bird, went ashore last night and were put in jail for disturbing the furniture appointments in the Swiss Bar. The old man, having nothing else to do, went ashore and paid their fines, $1.40 each.

According to Nile, things weren't very nice in the Chanaral housegow. Being a sort of stockade, it had neither floor nor roof, not even a mat to lie on. There is a vine with thorns, vicious spear-pointed thorns, and more poisonous than ivy five times over, growing thick as you please on the walls. This vine serves the purpose of a sentry, it cannot be bribed, and the jail-going element is afraid of it. Nile and Julio slept on the ground and received no breakfast. When you go to jail in these parts you must have outside connections. Nile and Julio were glad to see the old man.

February 7. The Humming Bird has been whooping it up all day. The propeller shaft has been turning over at the rate or 62 revolutions per minute, which is the *grande* atonement for spiritless effort in the past. We are in heavy seas, but the ship meets them squarely, and, taking them squarely, naught but spray reaches the cowsheds. At 10 a. m. we notice a herd of seals northbound, glistening and rotund and nimble; also we meet a wind that is stiffening with strength and a drop in temperature.

At 10 p. m. one hears from the bridge the clear note of clapper and brass—four bells. The third mate patrols the bridge and a sailor the forepeak. And in a moment a reply resounds from the bell on the foc'sle, and from out the darkness comes the beautiful cry, "ALL'S WELL, SIR." It is exquisite, that cry, and freighted with meaning. Its very sound makes a feeling of security permeate you through and through, for in the hands of those two, keeping vigil, is vested the safety of all aboard.

February 8. Well, this is the 55th and last day on the Humming Bird. The handsome, good-natured General still licks your hand with his raspy tongue, and the calves since leaving New York have grown. Fifty-five days is a long time for cattle to stand practically in crates and still refuse to get sick or lose their stolid dispositions. And one marvels at them, and for the weary patience they evince. Tomorrow they will start on a night's ride to their future home in the Andes, and after that their trials so far as this trip is concerned should be over.

The Humming Bird has pushed determinedly through rough seas since morn. The Pacific can be pacific, but it can be ruthless, too. The saloon messboy sprinkled the tablecloth with water to keep the dishes from sliding around. At 6 p. m. we heave in sight of land and Valpariso, and two hours hence we are in the harbor lane, barely moving, killing time, waiting for a pilot to come and assign us a berth. The pilot is slow, and we cruise around a port area until he arrives. The bow anchor dropped and the stern made fast to a buoy constitutes putting the ship away. We are too late for the doctor and his coterie, so for tonight we are the same as in quarantine or at sea. Nobody can go ashore, and no boaties can loiter at our ladder looking for business.

The crew congregate amidships and feed their hungered eyes on whatever scenery is available. There are many ships in the harbor, ships under flags of many lands, and many whom this crew recognize and probably have been members of. A few births distant is the dreadnought that England sold to Chile for a "song." It is a big monster and looks both sinister and stately in the after-twilight glow. But what does Chile want with a man-of-war like that? As Chileans with whom we have come in contact,

(Continued on page 344)

LOADING THE WISCONSIN CATTLE FROM THE BOAT TO A CHILEAN BOX CAR AT VALPARAISO

Senor Mitrovich, one of the owners of San Vincente, is standing to the right of the cattle crate.

ONSIN CATTLE ARRIVE AT SAN VINCENTE IENDA, THE HOESLY PURCHASE IN THE REAR

THE HUMMING BIRD AT ANTOFAGASTA, CHILE

Stop was made here to load nitrate. The small man at the left was the humpbacked cook that made the goulash for the stevedores. He uses everything he can get his hands on,—potatoes, fish, onions, bananas. All mixed together it is cooked on deck in a big iron kettle.

DAIRY MARKETS IN 1926 AND COMPARISONS

THE attempt has been made in the accompanying tables to give a survey or picture of dairy marketing activities during 1926, together with comparisons with previous years. Most of the price quotations are from reports issued during the year by the Bureau of Agricultural Economics, U. S. Department of Agriculture, the Wisconsin Department of Markets, and the Wisconsin Department of Agriculture. The averages are simple averages of the monthly quotations, and are not weighted according to the actual marketings each month except in the few cases noted.

Pooled Prices for Market Milk

We are particularly grateful to the various milk producers' associations that have given us the pooled prices they have paid during the past year. We caution against making direct price comparisons between these associations because there are several factors involved in the establishment of prices in widely separated communities that it is impractical, if not impossible, to present. Supply and demand, city requirements, distance from market, and other conditions peculiar to a given territory have their influence on prices irrespective of the efficiency of the co-operative milk marketing organization.

Members of these associations averaged a return of practically the same price secured in 1926, but in every case exceeded 1924 by 8 to 44 cents a hundred. This corresponds with prices received for milk marketed in other forms. While prices are no higher, net returns are above 1925 and 1924 by reason of the reduced cost of feed.

Profits Above Feed Cost Largest on Record

The dairy farmer has good reason for feeling that 1926 was kind to him, for his returns above feed cost were the highest on record for several years and nearly equal to the high price period of 1919 and 1920. While some other costs of production may have been higher, the few reports that have come to Hoard's Dairyman indicate that the dairy farm returns in 1926 were among the best on record.

Disregarding the increased production per cow that has taken place in the past ten years and that has had an important part in increasing dairy farm returns, cost formulas for feed and market prices of dairy products show a very satisfactory condition prevailing in the industry. The spread between the feed cost of market milk and price received was $1.74 in 1926. This is 23 cents above 1925 and is exceeded only by a few cents in 1919 and 1920. Producers of cream made into butter received a return of 25.9 cents a pound fat above feed cost in 1926, which is 2.4 cents above the spread in 1925 and is exceeded only slightly in 1923 and 1919, with the return in 1920 being 3.4 cents greater.

The following table of the spread between prices received and costs of feed is based on the average prices for butter and for milk as reported in Tables I and XIII, with feed prices as given in Table VI:

	Market milk per cwt.			Fat per pound		
	Rec'd.	*Feed cost	Spread	†Rec'd.	‡Feed cost	Spread
				Cts.	Cts.	Cts.
1926	$2.76	$1.02	$1.74	47.9	22.0	25.9
1925	2.68	1.17	1.51	48.8	25.3	23.5
1924	2.64	1.09	1.55	45.8	23.4	22.4
1923	2.71	1.03	1.68	49.4	22.3	27.1
1922	2.31	.86	1.45	43.9	18.7	25.2
1921	2.67	1.15	1.52	46.8	24.4	22.4
1920	3.53	1.77	1.76	66.3	37.0	29.3
1919	3.50	1.71	1.79	65.0	37.3	27.7

*Based on the feed cost of 100 lbs. milk being equal to the farm price of 50 lbs. alfalfa hay, 100 lbs. corn silage, and 33 lbs. of a mixture consisting of 350 lbs. corn, 350 lbs. oats, 200 lbs. bran, and 100 lbs. cottonseed meal.

†Based on price of fat being 7.8 per cent above 92-score butter in New York. (See Table VIII.)

‡Based on feed cost of one pound butterfat being equal to the farm price of 18 lbs. alfalfa hay, 3 lbs. corn, 2 lbs. oats, 1 lb. bran, and 1 lb. cottonseed meal.

The price of feeds in New York is discussed as follows by Professors Warren and Pearson of Cornell in "Farm Economics:"

"During the calendar year, 1926, feed was cheaper than at any time since 1921 and 1922. The price of a dairy ration fell from an average of $41.81 per ton in 1925 to $37.26 in 1926. Corn meal fell from an average price of $47.89 to $37.40 per ton; gluten, from $43.11 to $38.72; hominy, $41.96 to $33.43; and cottonseed meal fell from $48.45 to $39.96. Ground oats and the wheat feeds were lower in 1926 than in 1925, but the declines were relatively small. Linseed meal was slightly higher in 1926 than in 1925. Fair farm prices for milk, eggs, and other live stock products and cheap feed during 1926 lightened somewhat the burden of the New York poultry and dairy farmer.

"Feed prices are about 25 per cent above pre-war, whereas milk and eggs are about 50 per cent higher."

Production and Consumption

Production of manufactured dairy products was somewhat less than in 1925 as is shown in Table XIV, but the net trade output or consumption is practically equal. Decreased production is doubtless due in part to fewer cows and in part to the increasing demand for market milk for city consumption.

The number of cows has decreased from 22,481,000 on January 1, 1925, to 22,148,000 on the same day in 1926 and finally to 21,824,000 on January 1, 1927. This is a decrease in two years of 657,000 head, or nearly three per cent. That there is no immediate danger of overproduction by increase in number of cows is indicated by the fact that there are 115,000 fewer heifers between one and two years than there were two years ago, although the number is four per cent greater than a year ago. Value of cows is 23 per cent greater than two years ago and 9 per cent greater than one year ago.

That city consumption of milk is increasing is indicated by the report that the receipts of milk in New York City in 1926 were 12 per cent greater than in 1923 and 4.4 per cent greater than in 1925. Reports from milk producers' associations also indicate greater sales of fluid milk, which is to be expected both from increasing population and increasing per capita consumption.

The Dairy Situation

The U. S. Bureau of Agricultural Economics has issued the following statement concerning dairy market conditions in 1926:

"Earliest indications were that production in 1926 would exceed that of 1925 by a good-sized margin, but by the first of June it was evident that unfavorable weather conditions in important producing sections were causing a shrinkage. June weather was more favorable and the flow of milk was stimulated, but the loss of momentum during the preceding month, a knowledge that storage stocks were again piling up, and recollection of what had happened to butter prices in December and January of last winter, all served in some measure to check a full comeback. The result of all this was an irregular production trend during succeeding months. The probability now, at the close of the year, is that butter production will about equal that of 1925 instead of

(Continued on page 345)

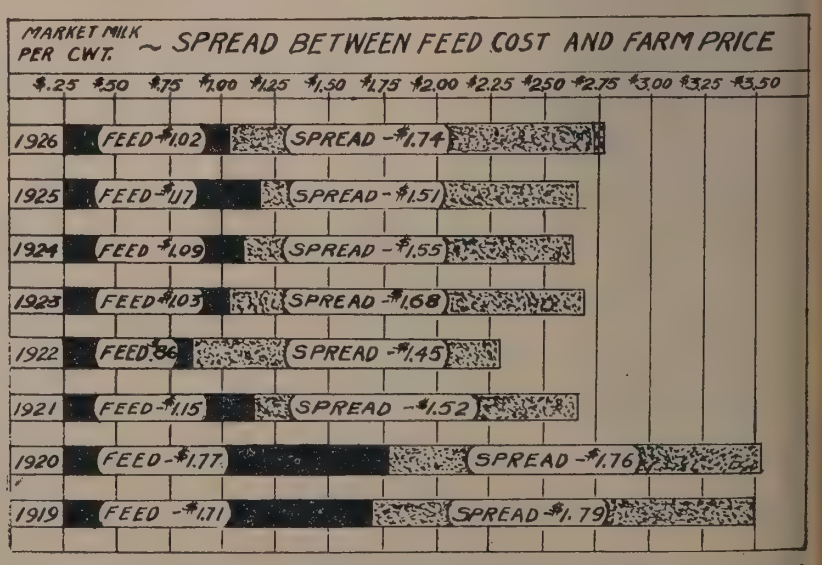
*Average price received for butter and p patrons per pound fat by 107 Wisconsin operative creameries producing a total of million pounds butter for 1926, or appr mately one-third of all the creamery butter the state.



†Average price paid for 3.5% milk delive to 61 Wisconsin condenseries.

‡Average price received by Wisconsin fa ers for milk as sold in its various forms.

FEED COST OF MILK AND FAT:—Based farm feed prices prevailing in Wisconsin, according to the accepted feed cost formu the feed cost of 100 lbs. milk was $1.17 a h dred in 1926 as compared with $1.23 in 19 the feed cost of a pound of fat being 28 c in 1926 and 28.4 cents in 1925. Feed charged as follows for 1926: Alfalfa $18.66 a ton; corn, $.74 per bushel; oats, per bushel; bran, $31 per ton; and cotton meal, $40 per ton. If clover hay, averag $14.30 a ton, had been substituted for alf hay in the formula, the feed cost in 1926 100 lbs. milk would have been $1.06 and of pound fat, 24.2 cents.

Producers of cream in 1926 received a return over cost of feed of 25.9 cents a pound fat, or 2.4 cents more than in 1925. This good showing was made despite the fact they received only 47.9 cents a pound fat at the creamery, which is one cent less than in 1925. Comparisons with previous years is highly favorable, as is shown above. The basis of the computations used above is explained in the table presented in the accompanying discussion.

The average price received by farmers for market milk in 1926 was $2.76 a hundred pounds, according to the U. S. Bureau of Agricultural Economics. The cost of feed to produce this milk was $1.02, leaving a return above feed cost (or "spread") of $1.74. This is 23 cents above 1925 and the largest spread received for several years. It is only exceeded by a few cents in 1919 and 1920. Basis of the feed cost computation is given in the table presented in the accompanying discussion.

*Chicago, New York, Boston, and Philadelphia.

†Receipts at these four markets average slightly over 40% of the total production of creamery butter.

‡Storage on last day of month or of year. The storage at these markets averages over half of the storage for the country as a whole.

Table XII—Milk Producers' Association Pooled Prices: The following are the average prices paid producers for all milk (including surplus) according to reports by milk producers' associations supplying these several cities. Prices between cities cannot be directly compared because of different conditions surrounding each association, because one association may be located in a thickly populated territory where there is little or no surplus while another may be in a heavy producing territory with fewer consumers, and because the operations for one year may be abnormal in some respect. Prices given are for 100 lbs. of 3.5% milk.

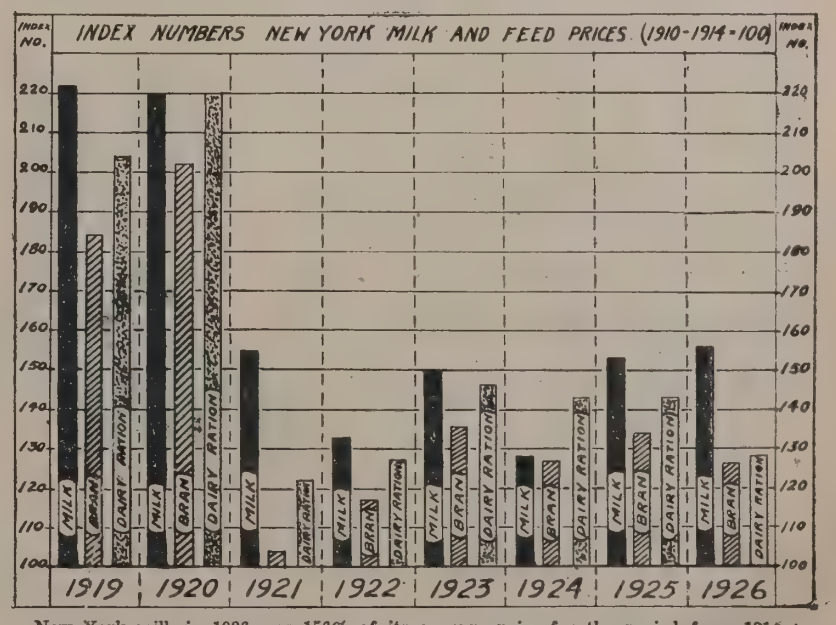
The attempt is here made to compare the returns per hundred pounds 3.5% milk as sold to four different markets. The comparisons are arbitrary and will vary according to markets and conditions in various sections. It is probable that the majority of farmers selling market milk did not receive as high a price as quoted for all their product, as some would take the "surplus" price. Also, the majority of farmers selling to butter and cheese factories probably did not secure the *estimated* returns as shown, but these returns are possible and are being secured or exceeded by efficient dairy farmers supplying well managed factories. The condensery returns are probably most accurately representative of the returns actually received by the average farmer.



The market milk and condensery prices are the average prices of 3.5% milk for the U. S.

The cheese factory return is computed on the basis of 100 pounds 3.5% milk having a value at the cheese factory of ten times the quotation of American cheese on the Wisconsin Primary Markets (Table III). The creamery return is computed on the basis of 100 pounds of 3.5% milk being valued at the creamery at 5.2 times the New York quotation on 92-score butter (Table I), covering both the butter and skimmilk values.

Table XIV—Trade Output of Manufactured Dairy Products
(Thousands pounds, i. e., 000 omitted)

	1926	1925	% change
Butter:

Trade output	50,018,123	50,123,427	−0.2

*Plus sign (+) indicates increase in storage, and minus sign (−) indicates decrease in storage.

New York milk in 1926 was 156% of its average price for the period from 1910 to 1914, with bran at 125% and a dairy ration of mixed feed at 128%. Milk prices advanced 25% more than feed and were higher than any year since 1910, except for the peak prices of 1919 and 1920. It is interesting to note that the advance in feed prices kept pace with the advance in milk prices for only the one year of 1920. The index numbers used here were compiled by Economics Department of Cornell University.

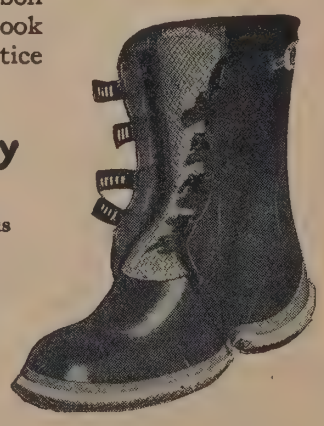
"U.S." Blue Ribbon Boots

are made of high quality rubber —flexible, long-wearing. They have sturdy gray soles. The uppers are either red or black. Made in knee to hip lengths

Rubber like this

means extra wear

in "U.S." Blue Ribbon Boots



IT'S a real test for the quality of rubber in your boot! You can stretch a strip cut from the upper of any "U.S." Blue Ribbon boot more than five times its own length. That means strength — long life where inferior boots give way.

The gray sole is oversize, tough as a tire for wear.

And the carcass is right. At every point in the "U.S." Blue Ribbon boot where wear is hardest from *4* to *11* separate layers of rubber and fabric reinforcements are *anchored in*. Here is a boot that is husky all through—and to spare.

Seventy-five years' experience in making waterproof footwear is back of "U.S." Blue Ribbon boots and overshoes. They fit better, look better, wear better. Get a pair and notice the difference.

United States Rubber Company

"U.S." Blue Ribbon Walrus

slips on right over your shoes. Its smooth rubber surface washes clean like a boot. In red or black—4 or 5 buckles

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page but your editorial must not exceed 250 words. Hoard's Dairyman assumes no responsibility for opinions expressed.

Jerseys and Guernseys Compared

HOARD'S DAIRYMAN:—In a recent letter in answer to Mr. Main whose letter appeared on page 22 of your January 10th issue, I refrained from giving any data regarding Guernsey Advanced Register records. This was because it has never been my intention to compare the two breeds or to do anything detrimental to the advancement of pure-bred cattle in general.

It might interest many of your readers to know that official records completed up to January 1, 1926, on about 31,000 Jersey cows show an average production of 446.40 lbs. fat from 8,327 lbs. milk, with a percentage of 5.361 fat; 22,900 Guernsey records show an average production of 9,675 lbs. milk and 483.2 lbs. fat; average test 4.99. This includes all records up to January 1, 1927.

When the Jersey records completed in 1926 are added to the above figures their showing will be improved somewhat, as the average for all records completed in 1925 showed a production of 9,348 lbs. milk and 498.12 lbs. fat; average test 5.329. The average Guernsey record completed during the same period runs 527.2 lbs. fat and about 10,250 lbs. milk.

As might be expected, the Guernsey being the larger framed cow is capable of a little better average production than the Jersey. Likewise, the Holstein-Friesian, being still larger, is capable of still greater average production. We can compare breeds until doomsday as I have always claimed and each will remain of the same opinion to the end. Where the Jersey people fall way behind is in not going after the business. The other fellow is not catching suckers as our friend, "Butterfat," fears, nor will Mr. Main's policy of live-at-home and advertise in "The Jersey Bulletin" bring about an increased demand. Advertise in the general farm and dairy papers and as you catch your suckers, hand each a dose of concentrated "bait" in the form of your breed paper. What harm is it to go out after suckers and then educate them? We were all suckers to start with. Just don't be a darn fool and try to play them for suckers after you have won their confidence.

Virginia. A. G. INGHAM.

The Sabbath

HOARD'S DAIRYMAN:—In your issue of Feb. 10 I note some curious articles on the Sabbath, rife with radical errors. In this article I desire to reply to Mr. Spicer of Illinois.

Mr. Spicer tells us, seemingly soberly enough, that "the Sabbath was for Jews only, and Gentiles were not allowed to observe it under penalty of death. The latter prophets allowed strangers, i. e., Gentiles, to keep the Sabbath with Jewish friends, but it was optional, not commanded. In no place in the Old or New Testaments are the Gentiles ordered to keep any day of the week as Sabbath."

I think this is the most glaringly absurd misstatement, as well as the most utterly inexcusable misstatement I ever saw in print. I wonder if the gentleman never read the fourth commandment. If not, I respectfully suggest to him that he give it his careful consideration. It tells us very explicitly who were commanded to keep the Sabbath. Here it is: In it (the Sabbath) thou shalt not do any work, thou, nor thy son, nor thy daughter, thy manservant, nor thy maidservant, nor thy cattle, nor thy stranger that is within thy gates. Here the "stranger within thy gates," who, according to the man's own admission means the Gentile, was just as pointedly commanded to observe the Sabbath as was the Jew. "Sabbath made only for Jews?"

I don't know how it is in Illinois, but over here in Virginia quite a number of our most respectable people consider Jesus a very respectable authority on such quotations. Did He say that the Sabbath was made for Jews? Never. What did He say? He declared that the Sabbath was made for man; and every Bible student knows that throughout the entire Scripture the word man as he

sed is a comprehensive term that in-udes absolutely every creature be-nging to Adam's race.

To illustrate, Jesus said to the mpter, "It is written, man shall not ve by bread alone but by every ord that proceedeth out of the outh of God." Can any sane Gen-le imagine that the term man as re used by the Savior included no-dy but Jews? If he did, then it as tantamount to saying that no-dy would be saved but Jews. How ould this suit our friend, Spicer? Virginia. L. L. HICKS.

Louisiana in February

HOARD'S DAIRYMAN:—Perhaps some your northern readers would like have a little picture of Southern uisiana the first week of February. Roses in bloom (as they have been winter); clover in pastures abun-nt and about half bloom; Bermuda ass and other pasture grasses green d from 4 to 6 inches high. Tem-rature averages about 70° for the hours, so cows are on pasture both y and night; vegetable shipping in ll blast with dozens of cars moving m this parish (county) daily; the st strawberries are on the market d selling for 75c per pint basket; l crop of potatoes recently dug and ring crop being planted; alfalfa out 12 inches high and will be dy to cut by first of March the st of six to seven cuttings. Corn und all plowed and will be planted t of February and first part of rch. Spring gardens planted and . Our dry cows and young stock e had no grain or silage all winter. Our winters are short and moder-; summers long and also moderate contrary to general impression ong people in the North. Our mmer temperature seldom goes ve 95 and usually a refreshing eze from the Gulf of Mexico, th of us.

The writer's introduction to thern Louisiana was about eight rs ago when around the first of ember everything was green and s grazing on good pasture. It dly seemed believable.

Dairying in Louisiana is still in its ncy although there has been rapid des along that line the past two three years. It is estimated that e $40,000,000 worth of dairy ducts are shipped into this state ry year, about $15,000,000 of ch is condensed milk.

The average quality of dairy cattle ow and the big majority of men aged in dairying is simply "milk-r cows," knowing little about the nce of feeding.

and in Southern Louisiana is still tively cheap and most of it very ductive. Southern Louisiana will discovered" one of these days and l values will have a sharp advance, until that time it is the land of lden Opportunity."

ouisiana. C. W. DAVIS.

law of Moses and Law of God Contrasted

OARD'S DAIRYMAN:—That the ten mandments of God are perpetual immutable will be quickly seen willingly admitted when the facts disclosed. The crime wave sweep-the world, wherein each offense is olation of one or another of the commandments, should make y father and mother carefully ider and anxious to learn the s pertaining to this vital question. e hateful deception that God's commandments have been abol-d and nailed to the cross, has had rld wide sowing and how horri-he harvest, but the searchlight of s precious word focused squarely on the situation will clearly discern long hidden truth and people every-where awakening to the fact that it was the law of Moses and not the law of God that was abolished at the cru-cification of Christ.

Wisconsin. J. E. LING.

Timely Subjects

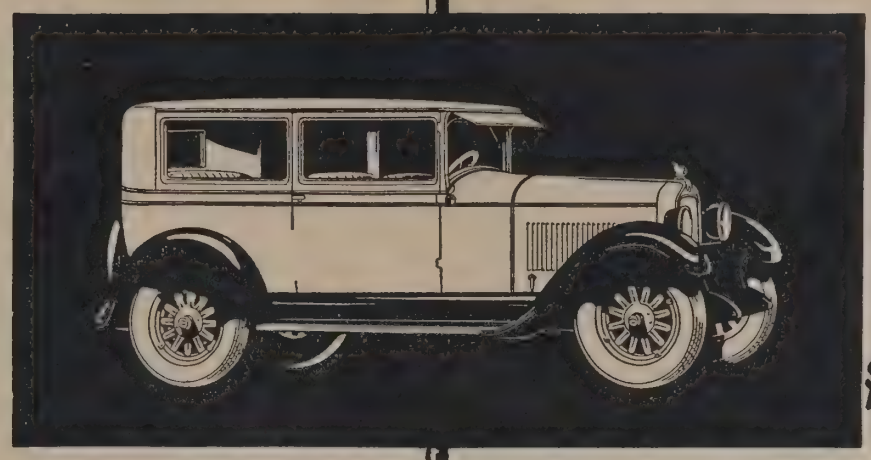
HOARD'S DAIRYMAN:—I have read letters of others which I enjoy. Every dairyman should take your grand paper. Here are a few sub-jects we should bring before Con-gress.

First is rural police. "Why, it will cost more money," some will say. But listen, in my own neighborhood $500 worth of chickens were stolen last year. In my county alone over $5,000 worth of farm products were stolen last year. How about the girls in teens which are disappearing daily, the murders, and the people being killed by reckless drivers?

The next subject is a standard price for farm products the year around. For example, wheat, $1.50; eggs, 40 cents.

Next question to do away with Sunday ball games, movies, and dances. And wouldn't it be better if our high school would read the whole New Testament instead of novels?

Let's have a better immigration law to stop the outlaws from other countries coming here. Make each man and woman give his or her past history.



Ohio. PAUL GARTRELL.

The way never to grow old and gray-headed is to die young.—Prov-erbs of Spain.

GENERAL MOTORS' LATEST ACHIEVEMENT

The New and Finer

PONTIAC SIX

SEDAN $775

Oakland announces an entirely new line of Pontiac Sixes, notably enhanced in beauty, incorporating numerous refinements in design and carrying *new low prices.*

New Fisher Bodies

Never in any low-priced six have been achieved such commanding beauty and luxury as in this latest achievement of General Motors. Lending luster to even the Fisher tradition of masterly craftsmanship, the new bodies by Fisher are longer, lower and superbly executed to the slightest detail.

All New Duco Colors

To emphasize their inherent smartness, all body types are finished in new combinations of Duco colors.

New Beauty and Style

Pontiac Six beauty has always been outstanding. But now in these new and finer models has been achieved not only new beauty but also an arresting rakishness—the results of a deeper radiator; larger, heavier, and more sweeping crown fenders; and more massive headlamps. Windshield pillars are narrowed to conform to the accepted custom-built vogue and to provide a wider arc of visibility. Window ledges are smartly recessed and finished in a contrasting color.

Mechanical Refinements

In addition, the new and finer Pontiac Six introduces many new features and refinements in engineering design—such as tilting-beam headlights with foot control, new transmission and brake levers, a clutch even smoother and more positive in action and an oil-sealed universal joint.

Two New Body Types

Two entirely new body types of characteristic beauty have been added to the Pontiac Six line. These are a dashing, youthful Sport Roadster, finished in Lucerne Blue, striped with Faerie Red; and a 4-passenger Sport Cabriolet, with Brevoort Green top and fenders, and body in Cherokee Gray, striped with orange to rival the vogue and smartness of the highest priced cars of the day.

Here's a Money Saver

With this Handy Farm Mixer you can make your own permanent improvements out of everlasting concrete and save about half the cost.

You can put in new walks and steps, make feeding and well platforms, put in concrete floors in your chicken and hog houses, stables and cow barns—make dozens of improvements that materially add to your convenience and to the value of your farm.

The "Handy" will thoroughly mix a wheel barrow load per minute. All metal construction—lasts for years. Can be operated by hand or with small engine. Used also for mixing slops, washing root crops—useful the year around.

You will be surprised at its low cost. It will actually pay for itself on a job or two.

If your John Deere dealer can't supply you, write us.

A Booklet Full of Helpful Suggestions—Free

"One hundred and one farm uses for concrete" points out many ways for profitably using concrete on the farm. Write to John Deere, Moline, Illinois, and ask for booklet MS-914.

Tangier Peas and Hungarian Vetch

C. L. GRIGGS, OREGON

TANGIER peas and Hungarian vetch, two of the most popular crops introduced by the Oregon Experiment Station in many years, are finding great favor with dairymen in the Willamette Valley and the coast section of Southwestern Oregon. In the valley section, Hungarian vetch is supplanting hundreds of acres of common vetch for all forage purposes and for seed production as well, being better adapted to the cold valley soils, aphis-resistant, of a better quality for hay, and yielding about the same amount of hay and more seed per acre than the common vetch. Thus far, in the Willamette Valley, Tangier peas are grown mostly for seed purposes but it is expected that the crop will be used considerably for summer silage when the cost of seed is less and the possibilities of the crop better known.

In Southwestern Oregon, particularly Coos County, the two crops are largely supplementary for each other, as Hungarian vetch will thrive where the Tangiers perish. Take, for example, the farm of A. R. Kay, who was largely responsible for the introduction of Hungarian vetch to his neighbors. On the high land along the bank of the Coquille river which borders the Kay farm, the Tangier peas thrive, while farther back from the bank on land which would be under water at high tide, if it were not for tide gates, the Hungarian vetch seems to be superior.

Six acres of Tangiers were sown on the riverbank land in October last year, three of which survived the winter's floods. When the crop from this three acres was put in the silo in July, the measured depth of settled silage showed a yield of more than 20 tons of silage per acre. The other three acres of the field were replanted in March to Tangier peas and yielded almost as much silage when harvested in August as the first field. The only apparent advantage, according to Mr. Kay, was that the fall sown land could be plowed and planted to corn for late fall green feed. The silage from these fields, when fed, was of good quality and eagerly eaten by the dairy herd.

Unlike Hungarian vetch, Tangier peas do not make a particularly fine quality of hay as the stems are too long and coarse. Neither are they very desirable as green feed, for the same reason, as several Coos County farmers have found during the past season. However, on some of the hill land where the stalks do not grow

TANGIER PEAS
County Agent C. R. Richards inspects Tangier peas grown on upland on farm of George Hampton, Coos County, Oregon.

rank, an abundant yield of medium quality hay is obtained. George Hampton was one of the farmers who grew Tangiers on hill land last summer, and says that while he had a real job harvesting them as a hay crop, his cows ate them well after they were cured in the hay mow. Mr. Hampton's neighbor, J. B. Moomaw, planted the crop for soiling purposes and obtained a large quantity of green feed from a very small area. C. E. Schroeder prefers Tangier peas for ensilage, Hungarian vetch for hay, and is experimenting with Japanese millet as a soiling crop. Mr. Schroeder's neighbors humorously allude to this farm as the "League of Nations," and indeed he does have crops from several sections of the globe, all introduced by the Oregon Experiment Station.

Hungarian vetch can be grown in any section of the country that has a climate no more severe than that of Western Oregon. A considerable market is developing for Oregon seed in California. Previously a great many cars of purple vetch seed have been shipped into the southern states for planting as a green manure crop in the citrus orchards. Purple vetch

SPRING PLANTED HUNGARIAN VETCH AND TWO-MONTH-OLD HUNGARIAN VETCH ON FARM OF A. R. KAY, OREGON
This was used for silage as is almost everything else grown on this farm.

a rather uncertain seed producer, many farmers are turning to ungarian vetch and Tangier peas hich yield more seed and are equally aluable as a green manure crop.

Regarding Tangier peas and their ospective usefulness, G. R. Hyslop, gronomist of the Oregon Experient Station, says, "We consider the angier peas a very satisfactory lage crop for regions where there is rather mild, moist growing season, id where there are no extremes of ld, unless there is adequate snow ver. It appears that the Tangier as are sometimes injured by severe eezing and thawing, even though e temperature does not get very low. would hesitate to plant them where e temperature is sustained at as w as 10 to 13 degrees Fahrenheit. course, Tangier peas will stand bstantially lower temperature when ere is adequate snow cover.

"I think there is a real possibility r the Tangier peas in the mild secns of Western Washington and the ast section of Oregon, some of the tions in Jackson and Josephine unties in Southern Oregon, and in ite a good deal of territory in Calinia. There is doubtless a great al of very good growing country for ese crops in the southeastern tes."

Pointers on Alfalfa Culture

HOARD'S DAIRYMAN:—"My experice has taught me that the depth of nting is a big factor in getting a nd of alfalfa," says Arthur Jewett Ingham County, Michigan, exitor of the grand champion bale alfalfa hay at the International ain and Hay Show at Chicago in 25. "From one-half to threeurths of an inch deep is ideal. ien planted at a depth of an inch more the results are not satisfacy."

t pays to have the alfalfa seed bed n and well packed before seeding, ording to Mr. Jewett. A sweet is absolutely essential for success l it is well to make the acidity t before seeding than be sorry afwards. Where alfalfa has never n grown before, Mr. Jewett ads inoculation. After a few years a good rotation in which alfalfa included, inoculation will not be essary. He regards it as a good n to mix in a little alfalfa when ding other grasses. In this way ew alfalfa field may be more easisecured.

More alfalfa growers fail because unadapted seed than from any er cause," says Mr. Jewett. A few ts less in price for the southern opean seed has tempted many n to purchase it instead of hardy thern seed. Such seed may actly fool a person by coming up ker, showing much promise, but er a cold northern winter the ntake is discovered.

lthough he has kept fields of ala for as long as 12 years, Mr. ett believes it a good plan to keep ds not longer than five years. er grasses are bound to creep in rather than fight them, it is bet- to seed a new field.

ebraska. H. H. BIGGAR.

Grading in Canada

OARD'S DAIRYMAN:—In the matof improving quality, we are mak- rapid strides in Canada. All but- and cheese intended for export t be graded by government grad- nd sold on this grade. The cheese ories and creameries are now ely paid for their product on the rnment grader's certificate. In , when grading was commenced, ations for Canadian and New and cheese were about on a par. n the Canadian cheese began to lead and this lead has been increased year by year until, in 1926, according to J. A. Ruddick, Dominion Dairy Commissioner, the average premium on Canadian cheese was .68 cents a pound. On our total output of cheese this amounts to $1,000,000. "If we make the best of our opportunities we have nothing to fear from competition," observes Mr. Ruddick. "Fair competition is a good thing and the proof of that assertion lies in the fact that Canadian dairying has made more real progress in the last five years than in the previous twenty."

The progress referred to by Mr. Ruddick was achieved by a revolution in our methods of securing higher quality. Previous to five years ago, education was the prop relied upon to maintain quality and improve it. Farmers were given oceans of good advice but no financial incentive to do better. Also, producers were well aware that the indifferent five or ten per cent could do more to lower quality than all the rest could do to prove it. All the educational effort was not wasted but results were never in proportion to the effort expended. Then a movement started on the Prairies to buy cream by grade and sell the butter on the same basis. Improvement in quality of creamery butter was instantaneous. From making the poorest butter in Canada, the western creameries were soon making the best. The movement spread to the East and now practically the whole of Canada buys cream from the farmer and sells butter according to its quality. The same principle has been applied to the sale of cheese and with the same results.

Canada. F. E. ELLIS.

Tourist—"Brothers! We've climbed to the top of this mountain to see the view and we've forgotten the glasses."

Scottish Guide—"Och! Never mind, there's nobody aboot. We can just drink oot o' the bottle."

NASH

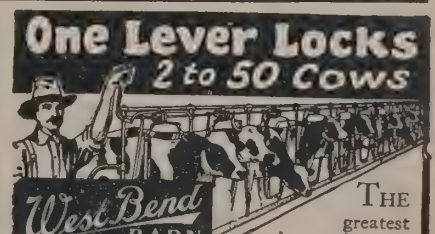
Leads the World in Motor Car Value

Quality and Value without an Equal
in the whole $1000 Field

By long odds the most distinguished motor car ever introduced into the $1000 field, this new Nash De Luxe Light Six is also the most remarkable performer.

Along with its notable beauty and classic body craftsmanship it has the vital superiority of a 7-bearing crankshaft motor—*the ultra-modern type.*

That gives you a superlative advantage over the standard 3 or 4-bearing motor in the way of matchless *quietness* and phenomenal *smoothness* thruout the full range of speed and power.



Colorfully finished in exquisite blue lacquer, with the lighter body shade contrasting smartly with the darker tone of upper body and fenders, and enhanced with a wealth of refinements and appointments it stands out as a motor car value clearly above and beyond comparison.

The attractiveness of the interior is enriched with a walnut finished instrument board and window ledges and choice upholstery of genuine Chase Velmo Mohair Velvet.

Headlamps as well as cowl lamps are executed in the bullet design. The steering wheel is of real Circassian walnut. There are bumpers in front and bumperettes at the rear, and a motometer surmounts the winged radiator cap. 4-wheel brakes and 5 disc wheels are also included as standard equipment within the price.

One Lever Locks 2 to 50 Cows

West Bend BARN EQUIPMENT

THE greatest time-saving convenience ever invented in barn equipment is the West Bend Automatic Stanchion with locking, releasing lever—**the original, lever-operated, swinging stanchion.** Costs no more than ordinary stanchions that must be closed and opened singly by hand. It also assures safety in locking up or releasing cows. One throw of the lever locks or releases the entire row of cows, controls from 2 to 50 stanchions. **Cow stops are operated at the same time,** guiding the cows into the stanchions. Enthusiastic owners everywhere. **Write today** for big free catalog showing complete line of West Bend Barn Equipment.

WEST BEND EQUIPMENT CORP.

Sell your surplus cows, poultry and other live stock with an ad on our Special Opportunities Page.

EDITORIAL COMMENT

EACH year finds a larger quantity of both vegetables and fruits in the market. The change that has been made in production of these crops is very noticeable, and it is due to the fact that dieticians urge larger consumption of these products and that people are more able to buy them. No diet is considered complete without vegetables, fruit, and milk.

We were forcibly struck by noting in a March 2 report of the United States Department of Agriculture that the daily movement is around 100 cars of celery, 25 of tomatoes, and 12 cars of strawberries from Florida; 200 cars of lettuce from the Imperial Valley in California; and 75 cars of spinach from Texas.

Since people are consuming more fresh vegetables, fruit, milk, and other dairy products, they have less doctor bills and are enjoying better health.

A DAIRY PILGRIMAGE

The first dairy pilgrimage took place last year when a number of members of various national dairy organizations and delegates of the American Dairy Federation went to Washington, D. C. The purpose of this pilgrimage was to become better acquainted with the work of the United States Department of Agriculture, and especially that of the Bureau of Dairy Industry.

The second annual dairy pilgrimage will take place this year April 26, 27, and 28—that is, these are the dates set for a trip to the United States Department of Agriculture and to review the work of the Bureau of Dairy Industry and such other bureaus as time will permit them to visit. Any person interested in dairying will be a welcome pilgrim.

We believe there is an advantage to the development of the dairy industry in having people informed as to what the United States Department of Agriculture is doing for the welfare of agriculture. It is well to have a clear understanding of the work of the Bureau of Dairy Industry. In no other way can we receive full benefit of the many good things being done for the dairy industry by the federal government.

THE COW WENT WRONG

An editorial in the Guernsey Breeders' Journal, entitled "The Judge Went Wrong," emphasizes a practice of the show ring which we believe is injurious to the development and breeding qualities of dairy cattle. The editorial goes on to say: "Where one follows the fair circuit it is quite evident that the reason for placing the same animal in one to three different positions at different fairs, is not so much the judgment of the judge as the condition of the animal."

Anyone who has made a study of dairy animals knows there is a slight difference in condition of any animal from day to day and especially so if the animal is put in an abnormally high condition. This invariably requires excessive feeding and such animals are very likely to have a decided slump in condition. A situation of this character immediately reveals that the show ring is permitting the feeder and, we might add also, the man who exhibits the animals to have too large a part in determining awards of the show ring. In other words, we judge condition, the skill of the man who feeds and handles the cow, rather than the merit of the animal.

Here is a sentence taken from the editorial in question which indicates to us that we are overconditioning our dairy show cattle: "A cow placed well up in the aged cow class early in the day, but when the same cow came in the Advanced Register class later on she placed down. This was a case of the same judge and practically the same animals in the class, but a difference of a few hours in the condition of the animal."

It is evident that this cow was overconditioned and was receiving more feed than she was capable of handling. While the cows will vary in their appearance from day to day they do not vary in appearance in a few hours, unless attempt is made to put them in the highest bloom and flesh. This very often means hiding defects which mislead the judge. Surely such practices as this can not contribute to a better type of dairy cattle and larger producers—the real purpose of the show ring.

McNARY—HAUGEN BILL

In our issue of March 10 we gave liberal extracts from President Coolidge's veto message of the McNary—Haugen bill. We did this that our readers could have opportunity to determine for themselves whether or not the President's reasons for vetoing this measure are sound.

It seems to us that those who think such legislation is sound and would assist in placing agriculture upon a proper basis should take the time to point out wherein the President's arguments are faulty or do not properly present the facts. Newspapers or persons who condemn the President's action by glittering generalities and prejudicial statements should be requested to point out, step by step, any misstatements they find in his message. Anyone can say that the President's veto message was "long and detailed," "prepared by many hands," and "unsound." And, moreover, that the McNary—Haugen bill would bring relief to agriculture. Not one of these statements is an argument for or against the message or the bill.

The critics of the President should analyze his arguments and show wherein they believe he has misrepresented the McNary—Haugen bill. Further, they should outline how the McNary—Haugen measure will operate in handling the various crops whose surpluses it proposes to store or export. For example, how would the approximate surplus of 500,000,000 bushels of corn of 1925 have been handled? In 1914, nearly 51 million bushels of corn were exported and less than 10 million imported. In 1924 we exported less than 10 million bushels of corn and imported about one-half as much. The McNary—Haugen bill made provision for storing surplus, but its chief purpose was to export surplus. It occurs to us the proponents of this legislature should carefully work out just how our surplus corn will be handled, as well as all other crops covered in the bill as basic commodities.

The dairy interests are solving their marketing problems. Dairy products are stored in peak of production by co-operatives, corporations, and individuals, and sold during periods of low production. This stabilizes prices and helps prevent overproduction. New markets are being opened up for dairy products; poor cows are being sold to the butcher. For two consecutive years there has been a decrease in the number of dairy cows. Dairy interests have not been able to discover any plan that will permit overproduction and still maintain reasonable prices for dairy products.

It is our opinion that if the McNary—Haugen bill had become a law, prices of agricultural products which it considers basic would have advanced temporarily. This would have stimulated production, notwithstanding we have seen statements that good prices do not increase production. This sort of reasoning is childish. Every farmer knows that high prices sooner or later increase production and low prices decrease production.

We cannot comprehend how the McNary—Haugen bill would be permanently beneficial to agriculture unless acreage could be controlled. There is a difference between seasonable surplus and acreage surplus. The McNary—Haugen bill might be made to operate in handling seasonable surpluses, but how it could be operated to handle unlimited production passes our understanding. Since none of the proponents of this measure have outlined how it would operate, we, of course, cannot direct ourselves to a discussion of the plans they may have in mind.

If the proposal were to work as those favoring it think it would, prices of the basic products, which include corn, wheat, rice, pork, and cotton, w advance. This means higher prices for food w be paid by the entire population and only third of the farmers would receive incre prices. Dairy farmers would pay more for feeds they buy as well as for many of their fo They would receive no benefit from this legislat but it would cost them much money.

Unless acreage were controlled, farmers pro ing these basic crops would not in the end be efitted. By increasing production, surplus w increase and the extra cost of handling it w wipe out the increased returns received for crops marketed at home. The McNary—Hau measure would mean cheap foods and feeds foreigners; higher prices for these products chased by our own people; and ultimately w prove disastrous to those whom it proposes help.

If prejudice and selfish interest only are t considered, those representatives in Congress voted for the McNary—Haugen bill voted to den the dairy farmer with added cost of produc and no benefits. Organizations like the Wisco Farm Bureau Federation that endorsed the m ure were asinine and neglectful of the selfish terests of dairy farmers, to say nothing of t lack of study and understanding of the prop legislation. If it were good legislation, the d farmer might well have contributed his shar paying increased prices for his feed that agri ture as a whole might benefit. But we are fir convinced it would in the end produce no be for the grain grower, yet would have increased production cost of the dairy farmer.

We commend the President for his veto the real interest of agriculture as a whole and dairy industry in particular. We suggest agai our readers a careful analysis and considera of the President's message. Do not allow the of sectional and business prejudice to close y eyes to reason and calm judgment as to what proposed measure would do.

WATER BUCKETS

It has been shown by tests that when cows h water kept before them so they can drink at time they desire, they produce more milk t when watered once or twice per day.

The results of an investigation, carried on by Bureau of Dairy Industry of the U. S. Departm of Agriculture, show that cows gave 3 per more milk when water was kept before them t when watered but twice per day. When g water but once per day they produced 4 per less milk than when permitted to drink at These comparisons were made under favor conditions. It is plain to anyone who has served how cows are watered, and especially cold weather, that keeping water before them increase the production of milk more than 4 e cent.

Anything as cheap as water and as esser should be furnished to cows in abundance at times. The quantity of water which a cow consume depends upon the feed she is receiv the amount of milk she is producing, the t perature of the water, and the weather. Wh cow is given dry feed she will drink more w than when given succulents. The cow needs water if she is fed large quantities of roots. may go a day or two without drinking when 100 pounds of roots per day. No sensible man, ever, will depend upon the feed to supply his with water or require the cows to drink under verse conditions.

The best way to water cows is to keep the w before them so they may drink whenever they thirsty. The cow, in reference to her water quirements, is a better judge than her owner. is one instance when a man should not ques feminine judgment.

Sweet Clover Pasture

Hoard's Dairyman frequently refers to sweet clover as being a very good pasture crop for dairy cows. I am persuaded to give it a trial. In planning my acreage I need to know more about how many cows an acre of the crop will carry and how long this will supply satisfactory pasturage.

Clarinda, Iowa. W. A. R.

Some data on the carrying capacity of the white biennial sweet clover have been collected by W. J. Fraser of Illinois. Fourteen farmers reported pasturing cows on sweet clover the first fall after it was sown in the spring with small grain. These farmers had 170 acres of the pasture and they pastured 271 cows, or 1.6 cows per acre for an average period of 1.7 months; .63 of an acre supported a cow during this time.

Twenty-one farmers reported on pasturing sweet clover the second year. They had 266 acres of the crop on which they pastured 388 cows or 1.46 head per acre for an average period of 3.9 months; .69 of an acre supported a cow for this time. These 21 farmers turned out on an average April 29 and took their cows off the pasture on the average August 26. By this time the growth in the small grain stubble of the new seeding is large enough to be turned on and it would carry the cows for a period of 1.7 months. Thus, by combining the old and the new crops, one is able to get between 5 and 6 months' service.

These figures are averages—not of a large number of farmers, but of enough to be fairly accurate. We have seen a good sweet clover pasture (second year) carry as many as 3 cows per acre from May first until the first of August. We have seen the fall growth (first year seeding) cut nearly 2 tons of hay per acre. These observations are given to show what can be done under somewhat ideal conditions. Unless one determines right from the beginning to have good sweet clover he is likely to be disappointed. If he succeeds in getting good pasture, he will be somewhat astonished at the service it will give.

Color Does Not Indicate Production

I have a red and white Guernsey that gives milk testing only 3.5 per cent, and have fawn and white cows that test 5 per cent. Does the color of the cow make the difference? What is the difference between a Jersey with a black tongue and black points, and a Jersey with a light colored tongue and light colored points?

Roachdale, Ind. J. R. M.

There is no relationship between the productive capacity of a cow and her color. The amount and butterfat percentage of her milk is not associated with color, except as a certain color has become a marked family or breed trait and this family run relatively high or low in test.

Because a Guernsey cow may be red and white is no indication that she will produce milk of a relatively low fat content. In the particular case cited, it is very likely that the ancestors of this red and white cow were normally low testing animals and that they happen to be red and white is only incidental. We know of many red and white Guernseys that test relatively high for the breed and if statistics were available, it would probably show that just as large a percentage of red and white Guernseys test high as there are fawn and white that test high. The highest testing Guernsey in a certain herd in this vicinity happens to be a red and white Guernsey. Her color comes mainly from the breeding on her sire's side as her dam is more nearly fawn color. In this herd are a number of light colored or fawn colored cows that are relatively low in test, although none of them will drop back to much less than 4.5 per cent for a year's average. Some of the lower testers will occasionally test for a month or two under 4 per cent, but this is rather unusual.

Our father was a breeder of pure-bred Jerseys many years ago and we well remember the emphasis that was then placed on a black tongue. Indeed, this was one of the first things that buyers would look at in purchasing a cow. Another thing that was looked for at that time was the length of the switch. This was merely a breed prejudice and was not in any way related to the productive ability of the cows in question. There is no basis for the belief that a Jersey with a black tongue or with a long switch will produce any more milk than one with a white tongue. The same is true in regard to the other color points in the animal.

In the past there was a considerable prejudice against Guernsey cows with dark noses. Despite the fact that in the show ring the dark nose is not discriminated against in the giving of prizes and it is not now included in the Guernsey scale of points, there still remains some prejudice with some buyers against a Guernsey cow with a dark or smoky nose. As time goes on, we believe this prejudice will evaporate because it has no real relationship in indicating the possible productive capacity of the cow.

Cane, Kafir Fodder, Alfalfa

The following feeds are available at prices indicated; ground kafir grain, 80 cents a hundred; bran, $1.65; cottonseed meal, $2.00; linseed meal, $3.50; corn gluten feed, $2.75; alfalfa meal, $1.45; alfalfa hay, $21.00 a ton; cane and kafir fodder, $8 a ton.

The cane and kafir fodder is all the roughage we have on the farm. Can buy alfalfa hay 2½ miles away for $21 a ton. We feed all the cane fodder and ground kafir fodder the cows will clean up. Would you advise buying the alfalfa hay at the price indicated? What concentrates mixture would you advise for feeding with the cane and kafir fodder? With this roughage and alfalfa hay?

Amarillo, Texas. J. J. R.

The cheapest source of total nutrients is from the kafir grain and the cane and kafir fodder. This combination does not make a desirable ration for dairy cows for three reasons; first, it is too low in protein, meaning that the cows would have to consume more than they actually will consume if enough protein is taken to meet the requirements; second, the combination would, in all probability, become somewhat unpalatable in which case the amount of nutrients consumed would not meet the requirements; third, the ration is too low in mineral substances.

The ration may be improved in the following ways: first, by adding alfalfa hay to the roughage; second, by adding just enough blackstrap molasses to the cane and ground kafir fodder to make it palatable; third, by making a concentrates mixture suitable for the roughage; fourth, by supplying a simple mineral mixture.

At the prices given, leaving out the kafir grain and fodder, the alfalfa hay is next to cottonseed meal in supplying protein cheaply; it is the cheapest source of total nutrients, cottonseed meal being second. It is advisable to buy the alfalfa hay. By adding this to the roughage and by improving the palatability of the cane and kafir fodder by the addition of molasses, one has a roughage combination that will tempt cows to eat maximum quantities and thereby get a greater portion of the nutrients from the cheapest feeds.

In the event the alfalfa hay is not added then we would by all means advise using the molasses with the fodder. This roughage with molasses will need a concentrates mixture containing between 18 and 20 per cent of digestible protein. Such a mixture could be made of 400 pounds ground kafir grain, 200 pounds bran, 200 pounds cottonseed meal, 100 pounds each linseed meal and gluten feed. This mixture contains 18.7 per cent digestible protein.

If alfalfa hay is included with the fodder and molasses added to the latter, a concentrates mixture containing between 11 and 13 per cent of digestible protein is suitable. Such a mixture could be made of 500 pounds ground kafir grain, 200 pounds bran, 50 pounds each cottonseed meal and either gluten feed or linseed meal.

If alfalfa hay is not included with the roughage a mineral mixture composed of equal parts of bone meal, finely ground, high calcium limestone and salt should be fed. With the feeding of liberal amounts of alfalfa hay along with the fodder it becomes a question as to whether there is need for mineral supplements. No harm can be done by feeding the mixture given and it is likely needed for the heavier producing cows.

Weight of High and Low Test Milk

Is there any set weight that a gallon of milk should weigh? How much difference can there be between the weight of one gallon of Jersey and Holstein milk? What would be approximate difference in weight between one gallon of Holstein milk and one gallon of 3.5% cream?

Priest River, Ida. L. L. H.

There is no legal weight for a gallon of milk, but it is generally estimated as averaging 8.6 lbs.

A gallon of Holstein milk will weigh from 8.58 to 8.6 lbs. as compared with a gallon of Jersey milk that will weigh from 8.6 to 8.62 lbs. This indicates that a gallon of Jersey milk will weigh from one-fourth to four-tenths of an ounce more per gallon than will a gallon of Holstein milk, the extreme difference being two-thirds of an ounce. A gallon of 20 per cent cream will weigh 8.43 lbs., the weight per gallon decreasing slightly as the test increases. For instance, 25 per cent cream will weigh 8.39 lbs. per gallon; 30 per cent cream, 8.35 lbs.; 35 per cent cream, 8.31 lbs.; and 40 per cent cream, 8.28 lbs.

It will be noted cream weighs less per gallon than does milk, yet the high testing milk weighs more per gallon than does the low testing milk. This apparent discrepancy is due to the fact that in normal milk testing from 3 to 6 per cent, the solids not fat increase along with the test. This overcomes the lower weight of the extra fat in the milk and the influence of the solids not fat is greater than that of the fat. The higher testing milk, therefore, has a higher specific gravity and will weigh more per gallon. On the average, a gallon of skimmilk will weigh 8.63 lbs., but a gallon of skimmilk from normal milk of high test will weigh more than a gallon of milk from milk of low test. A gallon of skimmilk produced from milk testing 3 per cent will weigh 8.59 lbs. as compared with a gallon of skimmilk from milk testing 6 per cent weighing 8.64 lbs.

Estimating Corn For Silage

I would thank you to advise in your usual prompt manner what amount you consider I owe my new tenant.

Tenant grew 12 acres of corn on his own land at his expense, he snapped 68 bbl. of corn for his own use (corn measured with husks on) from 6 acres. The remaining 6 acres was not snapped. The entire 12 acres was then cut, hauled, and put in my silo. We shared even the expense for cutting, hauling, and filling silo, including meals for men, tractor, oil, etc.

We have entered into an agreement for this tenant to work my farm on equal shares and I wish to reimburse him for my share or 50% of the ensilage that I am to furnish from said silo.

Silo is 12'x30' or 32' and after ensilage was in same for 3 weeks it settled down to 26' height.

Ashburn, Virginia. C. A. H.

There is no satisfactory method of estimating the value of corn in the field when it is to be used for silage purposes. However, we offer the following suggestions as to a rather rough method of estimating these values in this case:

A 12-foot silo filled to a settled depth of 26 feet would contain approximately 56 tons of silage. If this silage is of good quality, a ton of it would be valued at one-third the value of a ton of hay in the mow; if it is of only fair quality, it might be worth only a quarter of the value of a ton of hay. However, assuming it is of good quality and hay in the mow is worth $15 a ton, the silage would be valued at $5.00 a ton in the silo. There is no standard costs for harvesting a crop of corn and filling a silo. From such reports as we have, it would appear that this would amount to not over $1.50 a ton even when proper charge is made for the use of the silo itself. If this figure be accepted, the corn in the field would then be valued at $3.50 a ton. The 56 tons of silage would, therefore, indicate a value of $196 for the corn as it stands in the field.

Another method of estimate is to assume that the 68 barrels of corn contained some 200 bushels valued at 75 cents a bushel. This would amount to $150 as the value of the ear corn on six acres. The corn stover has about 25 per cent of the value of the ear corn, which would indicate a value of about $37.50 for each six acres. This would indicate a total value for the standing corn, or, rather, for that portion of the corn that was put into the silo, of $225. The actual valuation would vary from this according to the local price for ear corn and whether the barrel of snapped corn was equal to three bushels of merchantable corn as considered in this estimate.

If the above estimates are at all applicable, it would indicate that the tenant has supplied approximately $200 worth of corn. Under the usual share agreement, the tenant is supposed to supply one-half of the purchased feed. There is due him, then, $100 for your half of the feed he has supplied. That these estimates might do substantial justice to the tenant is indicated from the fact that, including the snapped corn he has had for his own use, this tenant would secure approximately $30 an acre for his corn. In the 1924 federal report, we find that the average cost of growing an acre of corn in Virginia is estimated as being $27.53, with a yield of 21 bushels to the acre.

What is the difference between a snake and a bed bug?

Answer: A snake crawls on its own belly.

A COW CALLING CONTEST

C-O-O-O B-O-S-S, C-O-O-O B-O-S-S! The hills of dairyland ring with the echoes of this musical call summoning the herd from refreshment to labor. 'Tis milking time! C-O-O-O B-O-S-S, C-O-O-O B-O-S-S!

Now the scene changes to a beautiful park on the shores of Lake Winnebago. 'Tis a day in July, 1926. Great crowds of country and city folks are gathered for the third annual Winnebago County, Wisconsin, dairy day picnic. A cow calling contest is in progress.

Though the scene has changed the actors have not, for they are the same pastoral peoples who for generations have been chanting C-O-O-O B-O-S-S, C-O-O-O B-O-S-S! The same fervor and feeling emanate from their vocal organs, perhaps more, for they are engaged in competition.

DAVEY, JONES, SCHULTZ, PANSIE, NELSON, MIRACLE, TUCKER

Corn belt farmers may have their hog calling contests, but for dairy farmers the cow calling contest's the thing. Many veterans of the cow yard were entered that day in what County Agent Gus Sell said was the first event of its kind ever held in Winnebago County.

Three judges were selected for the contest—T. G. Brown, A. T. Hennig, and Avery C. Jones. The calls were judged on volume, musical effect, and enticing qualities. Harold Tucker was declared the champion cow caller.

Six other prizes were awarded in the following order: Warren Miracle, William Nelson, W. H. Schultz, Mrs. Ferdinand Pansie, Robert Jones, and C. F. Davey. When the lady contestants began broadcasting to imaginary cows, a bit of humor was introduced in the shape of a canvas cow manipulated by two farmers who gamboled up to the platform.

There are three breed associations in Winnebago County—Holstein, Guernsey, and Jersey. Formerly each held its own annual picnic. Now, instead of competing with each other to see which can stage the biggest and best, they co-operate, getting together to make one big dairy day. Last year all previous records were broken when more than 6,000 people attended.

An old fiddlers' contest, the enrollment of new members in the three breed associations, an address, "Pinch Hitting in Dairying," by A. J. Glover, editor of Hoard's Dairyman, and a baseball game were other features on the day's program.

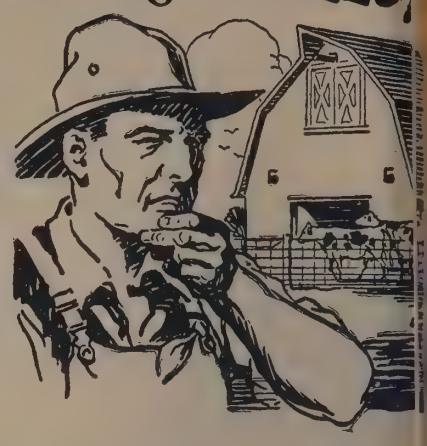
New Alfalfa Facts

We used to think that lime and inoculation about told the whole story but more recently we have come to learn that phosphates are often badly needed to make alfalfa yield to its highest capacity. This does not mean to say that phosphate is needed everywhere, or is as generally needed as is lime. Furthermore, there are no simple soil tests by which we can tell how much, if any, phosphate the land may need as we can so easily do in case of lime.

One of the surest ways to find out if the soil needs phosphate is to try a sack or two on an acre of our grain or corn. Phosphates generally make a big showing on barley and wheat, and often in oats, provided the soil lacks in this ingredient.

On heavy soils that have an ample quantity of lime in them, alfalfa can be started in corn by sowing just prior to the last cultivation. However, this method is almost bound to fail, unless the corn is planted thin—check-rowed at not more than three to four kernels per hill. The corn should be of an early maturing kind. The fields should be thoroughly well cultivated to eliminate most all weed growth. The alfalfa should be sown at a somewhat heavier rate of seeding than is ordinarily used. Generally, eighteen to twenty pounds per acre are sufficient.

On my father's farm we established, this past season, seventy acres of alfalfa with this method and every acre is a decided success. George Marr, a near neighbor, has established some eighty acres of alfalfa in the past two years, largely by seeding in corn. On heavy soils with ample lime and with the precautions mentioned, this method of seeding is giving reasonable success.



Another way of getting alfalfa and sweet clover started is to pasture off the nurse crop of oats. The cows are turned in when the oats are about ready to head out. It is generally best to turn in at least six to ten head per acre, so that the oats will be eaten down rapidly and not to let the cows remain in the grain field after they are filled up and begin to lie down. This is the time to turn them out in the regular pasture, otherwise they will waste much of the grain and may injure some of the alfalfa. This convenient way of handling the grain crop eliminates a great deal of labor and, at the same time, provides pasturage.—L. F. GRABER, Wisconsin College of Agriculture.

World Record Ayrshire

HOARD'S DAIRYMAN:—You give the world Ayrshire record holder as Nellie Osborne of Elm Shade. I would call your attention to the fact that another Canadian cow, Betsy Wylie, last year beat her record for butterfat. The latter's record is 21,805 pounds milk, 1,103 pounds fat, average test 5.06 per cent, as compared with 23,223 pounds milk, 1,003 pounds fat for Nellie Osborne. Betsy Wylie was owned and tested by Samuel C. Crockett of Nova Scotia, and was sold by him at the Toronto Royal Winter Fair last November to the Glen Campbell Stock Farm of Ontario. Her bull calf—then 15 months old—was sold at the same time and has since been purchased by Capt. J. C. Dunwaters, a well known Ayrshire breeder of British Columbia.

British Columbia. A. H. COTTON.

Are you feeding the right salt?

A NOTED agricultural expert, after a series of tests, found that when stock goes without salt it is not long until they take on a haggard appearance, the coat roughens and loss in weight and productivity follows.

Livestock needs salt to be well-conditioned and efficient. But you must feed them salt they will eat. An untouched salt pile does no good.

Feed your farm animals Diamond Crystal Salt. It is pleasant to the taste and free from inpurities. The stock will eat it—all they need; instinct tells them when to stop. Diamond Crystal Salt always makes better animals; better producers.

There is a Diamond Crystal Salt for every farm use—for livestock, for curing meats, for table and for cooking, for canning, for butter and cheese-making. Be sure to ask for Diamond Crystal at the store where you trade.

"The Salt that's all Salt."

Diamond Crystal Salt

Free!

We should like to send you a generous sample of Diamond Crystal Shaker salt and the interesting booklet, "101 Uses for Diamond Crystal Salt," without cost or obligation to you.

To Standardize Milk Ordinances

HOARD'S DAIRYMAN:—In order to stimulate interest in securing for West Virginia a better milk supply, Dr. Clarence E. Smith, associate milk specialist of the U. S. Public Health Service, has come to West Virginia for a three months' visit during which a state-wide milk campaign will be waged. The adoption of standard milk ordinances is being considered as the first and most important step in getting proper local assistance to the representatives of the state departments which have to deal with this problem.

Statistics show that 5,008 children under 5 years of age died in West Virginia in 1925, of which number more than 3,800 were under one year of age. More than 1,400 of the children under two years of age died of causes attributed to diet—in other words, milk, since that is the common diet under five years although not used nearly as much as it should be. These few figures point out the tremendous importance of the milk problem in West Virginia and, of course, in all other states. High infant mortality and poor milk supply always go hand in hand.

Under the new standard milk ordinance, which it is hoped that West Virginia cities will adopt, the local health officers will inspect and grade all dairies supplying milk in their localities. To provide Grade A milk the dairy must have three feet of lighting and 500 cubic feet of air space for each cow, solid sanitary flooring, painted or whitewashed walls and ceiling, clean barnyard and milk room, sterilized utensils, and yearly health certificates for all employees. In addition, all cows must pass a tuberculin test and a physical examination.

The local health officers of all cities adopting the ordinance will work in close co-operation with the state milk inspector.

The standard milk ordinance started in Alabama in 1923 when the health authorities of that state requested the federal authorities to assist them in working out a uniform program for the state. This was done and in 1924 an effort was made by the U. S. Public Health Service, looking to a standard milk ordinance for the nation. Louisiana adopted the ordinance only to find that more than half of the milk used by New Orleans was supplied by her neighboring state, Mississippi, and asked that they certify all their dairies supplying milk to New Orleans. The result was that Mississippi passed the standard milk ordinance giving protection not only to Louisiana but to her own people.

Under the present plan, the dairy interests of the state are working hand in hand with the state officers, realizing that the proposed milk ordinance is based on right principles and that it makes a greater demand for their product. This is proven by the fact that the National Dairy Council endorses the U. S. Public Health Service program.

West Virginia. ROSS B. JOHNSON.

Cows Eat Subsoil

I am feeding corn silage, alfalfa hay, a 24 per cent protein concentrates mixture, minerals, tonic, and salt to my cows. They persist in eating subsoil. What is the cause of this?

How much feed value is there in fodder that has been out all winter when it is ground fine and fed to cows? How does it compare with corn silage cut in at the proper stage?

Wadsworth, Ohio. C. E. D.

We are unable to ascribe a cause for the cows that seemingly crave something they apparently are not getting as indicated by their eating subsoil. We offer the following suggestions concerning the ration fed: (1) If liberal quantities of alfalfa hay are eaten daily (8 to 12 lbs. per cow) one does not need a 24 per cent protein concentrates mixture to properly balance the ration. A mixture containing 12 per cent is more suitable. (2) If possible we would find out what the mineral mixture is composed of, if this is not already known. A mixture supplying calcium, phosphorus, sodium, and chlorine, such as would be had in equal parts by weight of salt, bone meal, and finely ground limestone (high in calcium and low in magnesium), is all that is needed, especially when such a good legume hay as alfalfa is being fed. (3) Cows that are fed corn silage, alfalfa hay, and a grain mixture suitable for such roughages do not need a tonic.

We could not say definitely how much food value is left in corn fodder that has been out all winter, though in comparing it with corn silage on the dry matter basis the silage would be much higher than the fodder. Cutting or grinding the corn fodder would not increase its food value, except as it would induce cows to eat a larger proportion of it, and thereby reducing the waste. Cutting or grinding does not convert a roughage to a concentrate, increase its digestibility, or reduce the percentage of fiber; it helps to get more of it through the cow.

Folks

There's your folks and my folks
The best folks that be;
Better folks than our folks
No one ever sees.
Treasure them so tenderly
Let their hearts divine
Folks is blessings, heavenly,
When they're yours and mine.
Soon the Sea o' Life'll sweep
Some o' them away;
Your folks 'n' my folks
's slippin' every day.
Fill their hearts with sunshine
Pump 'em fuller yet!
Milk o' human kindnesses
Never hurt a pet.
Treasure them so tenderly
Let their hearts divine
Folks is blessings, heavenly,
When they're yours and mine!

INTERNATIONAL SPEED TRUCK
Big-capacity, low, easy-loading for all loads

International 3-ton Truck in the dairy business, owned by Harry Marsh of Carlisle, Ia.

Eighteen farmers at Swift Current, Sask., Canada, are using International Speed Trucks, with grain bodies, as above.

Begin this year to Profit with this Truck

WHEN you come to buy the motor truck that will put your farm hauling on a fast modern basis, remember that INTERNATIONAL HARVESTER *is equipped to help the farmer as no other organization can!*

International Trucks range from the light International, the ¾-ton "Special Delivery," up to the big 5-ton Heavy-Duty unit. They include the most complete line of Speed Trucks on the market, both 4 and 6-cylinder, for 1¼ and 1½-ton loads. If the truck you want is a handy, economical, long-lasting truck for loads of moderate size, one of the Speed Trucks will suit you to a "T."

International in every size is a quality truck—big value at its price. Bodies for every kind of farm load, comfortable riding, with sturdy chassis and ample dependable power for hauling loads over road and field.

Then, SERVICE! You know International Harvester service—it is rendered in fullest measure to International Trucks. We maintain 126 Company-owned Motor Truck Branches and Service Stations in the United States, a wonderful organization of service ready to help any owner meet any emergency. Branches and dealers always close at hand.

Haul your loads four times as fast, do each half-day's hauling in an hour—so you can get back to your fields and livestock where your *profit* is waiting to be made. Let an International help you. *Write us for a Catalog.*

Varying Cream Tests

HOARD'S DAIRYMAN:—"It does not matter what kind of milk you run through a separator as long as the cream screw is set to a certain point, the test will remain the same!" This emphatic statement is often heard in a gathering of farmers. Why would it not be so? The cream screw is set to regulate the test. Cream is cream!

A member in the Leelanau Association of Michigan had this same discussion with his neighbor across the road. It so happened that he had Jerseys and his friend had Guernseys. This was a typical chance to try it out. To get a disinterested person to do it, the tester of the local association was chosen. The milk of both herds was run through the same separator and the cream screw was not touched. Both herds were tested to find out the average test. The cream from both morning and night of each herd was mixed and a sample of cream was taken from each herd making a composite sample.

The average test for the Jerseys was 5.9 per cent for milk and for the cream 54 per cent. The average test for the Guernsey milk was 4.7 and for the cream 45 per cent. The Jersey milk tested one-half per cent more than the Guernsey, and the Jersey cream tested 9 per cent more.

This shows that the rich milk has a much higher cream test than a lower quality. This should teach us to set our separator cream screw according to the average test of our herds each month. As our test increases or decreases, we should regulate our cream test accordingly as it is generally known that best results are obtained from a 38 to 40 per cent test.

WALTER G. KIRKPATRICK, Tester.

From Loss to Profit

HOARD'S DAIRYMAN:—Among the improved and improving herds of the Endeavor Association of Wisconsin is one which is very prominent. As I started the year last February, I found a mixture of all kinds of cows, poorly fed, and not bringing any profit at all in the herd of Walter Moss. There was even a loss of $21.83 for that month. Mr. Moss was quite depressed by such low standing but started at once weeding. Seven of the cows had gone when I came for second time and the herd was almost even in feed cost and value of product. By culling and then buying some Jerseys he succeeded in getting better and better results.

It took a long time to convince him of the paying proposition of the so-called high-priced feeds, but in the ninth month he made a real trial with bran, cottonseed, and oil meal. At the end of the last month his herd cleared $84.88 instead of $21.83 below feed cost, the herd consisting of 12 cows, instead of 19 in the beginning.

The figures in his herd book are backed by cream checks. It was his convincing talk about the value of cow testing that let us find in two days the missing farmers to make the good work go on for a second year of cow testing.

WILL BODEKER, Tester.

Write the C. T. A. Editor Hoard's Dairyman, for our prize offer to testers for monthly and annual reports.

Michigan Goals

Mr. A. C. Baltzer, in charge of Michigan cow testing association has set the following goals for accomplishment by testers during 192

1. Each tester is to strive to have a waiting list of members anxious to join in the testing association.

2. Each tester is to bring the pure-bred sire situation among the cow testing association members up to 100 per cent use of pure-bred sires. At present the rating is 90 per cent of the 2,600 members using pure-bred sires.

3. Sectional meetings will be held during the spring and fall months.

4. Each tester is going to endeavor to have two safety bull pens built among the members of his cow testing association. Plans have been furnished each tester. These may be built as a demonstration or as direct personal work by one or another member. At any rate this is a goal that each tester will try to live up to this coming year.

5. The alfalfa acreage which is nine-tenths acre per cow under test in Michigan cow testing association will be increased to one acre per cow under test if possible. Likewise the sweet clover acreage is due for enlargement. At present there are three-tenths acre per cow under test and it is desired to increase this to five-tenths acre.

6. Each tester will endeavor to make greater use of the Michigan Record of Performance. With 1,34 entries in the first volume covering nearly two years' work and 1,050 entries in the second volume covering the year 1926, it may be possible to have a larger number entered during 1927.

7. Each tester will keep further information about the testing association results in a log book furnished him by the Dairy Department, Michigan State College.

EIGHTY MICHIGAN COW TESTERS ATTENDED THE ANNUAL CONFERENCE AT EAST LANSING DURING FARMERS' WEEK

A Decided Preference for DE LAVAL Separators and Milkers by members of Cow Testing Associations

IN the United States there are approximately 22,000 members of cow testing associations —the most progressive group of dairymen in the country.

Each cow testing association is in charge of a competent tester who weighs, tests and records the milk from each cow, and frequently tests the skim-milk from the cream separators of the members. The testers know exactly what each separator does and are in an ideal position to observe the work of milking machines.

Reports recently received from approximately 35% of all the cow testers in the United States show that of all the members using cream separators and milkers

60.8% use De Laval Separators
28.7% use De Laval Milkers

A remarkable showing, not only on separators but on milkers as well, in view of the fact that most of these De Laval Milkers have been put in use within the past six years.

The reasons for the greater use and popularity of De Laval Separators and Milkers are simple. The Babcock Test proves the De Laval Separator skims cleaner. Years of use prove it gives longer and better service. The milk scale and production records prove the De Laval Milker milks better. The watch proves it milks in less time.

In the long run De Laval Separators and Milkers are by far the most economical. They pay for themselves. See your De Laval Agent or write the nearest office below for full information.

The De Laval Separator Company

NEW YORK	CHICAGO	SAN FRANCISCO
165 Broadway	600 Jackson Blvd.	61 Beale Street

What a Few Cow Testers Say:

I will state that, according to my knowledge, De Laval Milkers and Separators are the best and the cheapest in the long run.

During the past two years' work in this association I have made numerous skim-milk tests and find the De Laval the only one which can be relied on to skim with 1-100 of 1% under good conditions.

I find that on the average De Laval Separators skim closest, last longest and run the easiest of any make I have come in contact with. Ninety per cent of all tests made on De Laval Separators run .02 per cent or less.

In my experience with milk separators, I have found the "De Laval" to be the most practical, economical and efficient of any separator in existence.

De Lavals are very efficient—skimming to less than .01 per cent and never over .03 per cent, are easy to clean, operate and maintain.

In all my experience around cows and their owners, I have seen numerous makes of milking machines used and these discarded for one reason or another, but I have never seen a De Laval Milker discarded. All the De Laval users are well satisfied.

The De Laval Milker users are very well satisfied with their machines, and can talk praises for them. Only yesterday a dairyman using a De Laval milking machine said if he had to get along without his milker, he would sell his cows.

The common remark heard among members regarding their De Laval milking machine is this: "Take my machine away and you can also take my cows." I have never heard any complaint of dissatisfaction among De Laval patrons about their milkers or separators.

The experience in other associations leads me to believe the De Laval is the most satisfactory milker for the average farmer. There are no adjustments to be made. There are very few farmers who can or will take the proper care in adjusting the speed of a milker. The consequence is that soon they "cuss" the machine and quit using it. I have yet to see a De Laval system lying idle on a "going" farm.

I test the separators in my association every month, and the De Laval certainly doesn't lose in a comparison with other separators. Have a few rather ancient De Lavals which are still running good and skimming as low as 1-100 of 1%.

After five years of cow testing, I will say that both De Laval Separators and Milkers are the best of all makes that I have seen in operation and have always boosted for both machines.

"PELOUZE"
New Dairy Scales
Three Sizes: 40, 60 and 120 lbs. by Tenths of a Pound
Guaranteed Accurate

Made to comply with Departments of Weights and Measures. Large 7-inch Dial, with distinct, black figures and graduations. Patented adjustable hand for obtaining the tare weight of empty pail. Order through any leading supply house, specify "Pelouze." If they haven't it order direct.

Soy Beans for Dairy Cows

HOARD'S DAIRYMAN:—For the last 12 years farmers of Shelby County, Kentucky, have been failing to grow red clover. This failure has now reached a point where farmers are becoming much alarmed about the unproductiveness of their soil. Almost every farmer who has not limed his land will tell you that he has wasted hundreds of dollars, buying and sowing red clover seed during the past 12 years.

In a dairy county like this, which used to be even more of a dairy county than now, legumes are very essential for successful dairying. However, almost all farmers were slow to find a substitute for clover. This may have been responsible in part for Shelby County's losing her reputation as the "Jersey Isle of America."

Some change had to be made and many of them took up with the southern cowpea until the seed went so high that prices were prohibitive. Through the publicity of the crops specialist, Mr. Kenney, of the College of Agriculture, a few were learning about soy beans. When I came to this county in 1925 several farmers were already sowing soy beans. About 3,000 bushels were sown in 1924. One seed dealer was asked to handle soy beans and he said, "Not me! I have 12 bushels of those things that have been here two years and the farmers of my community won't sow them." That same year his people did sow 250 bushels.

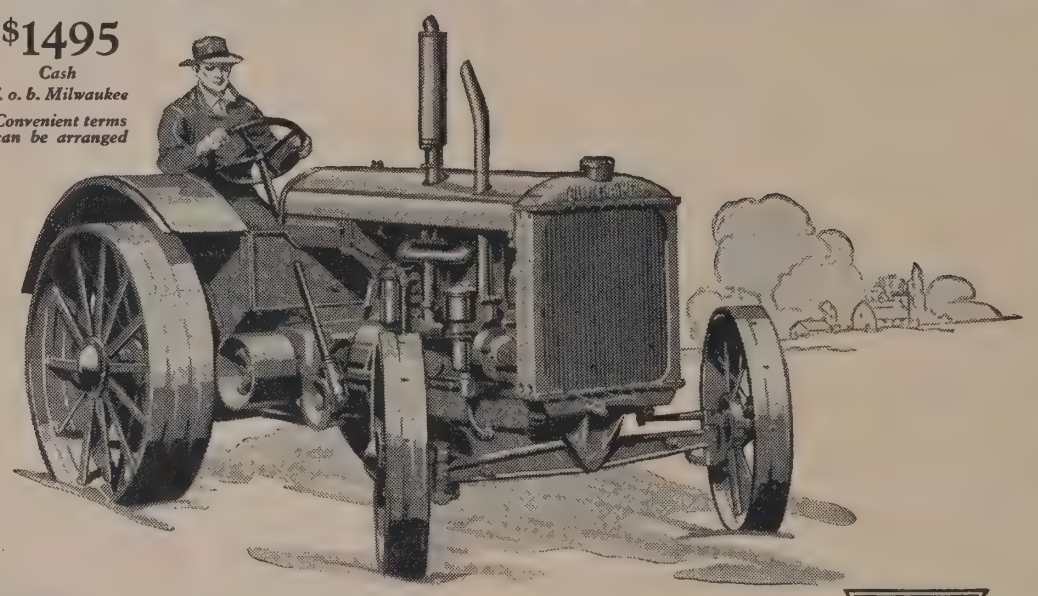
The necessity of inoculating the soy bean in order to have success was where the farmer left the track. Most all men expected two things, a soil builder and a hay crop. At the same time if they failed to inoculate they did not get either and were disappointed. In the beginning soy beans were sown with millet and with Sudan grass and cowpeas. It was a common sight to see 10 to 15 acres of growing soy beans, uninoculated and yellow. In addition to not understanding inoculation, it was a common mistake to buy poor varieties and old seed with low germination because it was cheap. This resulted in more dissatisfaction. Field meetings, demonstrations, and publicity were the means of overcoming opposition and to popularize soy beans.

In 1925 the farmers sowed about 5,500 bushels and their cows, horses, sheep, and hogs were fed upon thi fine hay. The problem of overcom ing opposition was no small one, a because the farmer hated to give u his clover. Some farmers would sa beans ruined the land; others woul claim that stock would not eat th hay; but the truth bore fruit an pushed its way to the front. Man farmers have not learned yet wher beans should come in the rotation, a quite a few will follow soy beans wit corn or let beans follow tobacco o wheat which is not the best practice

The original idea was to gro beans for cow feed, but this last yea cheaper seed caused them to branc out. Seventy acres were sown an plowed under as a green manur crop. Twenty-five acres were sow for seed and the great bulk of th balance was grown for dairy cows.

The average yield of soy bean ha in Shelby County is about 1½ ton per acre—this includes the thin soil poor seedings, and poor stands. W have in our borders about 18,00 dairy cattle. To feed these on so bean hay would require 12,000 acres or 18,000 bushels of seed annually This indicates that a good many o our dairy cattle still know what timo thy hay and sorghum cane tastes lik —which is true.

Mr. W. A. Newton seeded thirty acres of Virginia Browns for seed i 30-inch rows and purchased a littl Giant harvester to save them with But the fall was so wet that he coul not get to the field but one-half day Only twenty bushels were saved. H is now harvesting his crop with hogs



Mr. B. A. Thomas had 120 acre harvested for seed and saved abou 1,000 bushels. The hogs are harvest ing some of his beans also. Only 80 bushels of beans produced in thi county will be for sale this year.

Shelby County farmers have nov learned that the right variety of so bean hay is an excellent substitut for red clover in feeding dairy cow and are becoming reconciled to it use, as would be indicated by the fac that they sowed 9,000 bushels i 1926. This is a 200 per cent increas in 3 years and we plan to hold thi with a small increase until alfalf will take the place of soy beans fo our 18,000 dairy cows.

The difficulty of saving soy bea hay in rainy weather is always a problem but not nearly so big a prob lem as saving cowpeas, for bean have a much lower water content an cure more rapidly. Often much com plaint is made about the high price o seeding an acre and then running th chance of losing the hay in a we fall as was true here the past tw years. To meet this problem, I foun Roy Miller using a method in 192 that was successful in saving his ha during rainy weather. He used thre tobacco sticks about four feet long placed them in a wigwam position tying top together and cocking eigh to ten rake swathes to the cock around and over these sticks. Th beans were mowed down in the morn ing and were allowed to cure thi way. This method was widely pub lished in our county this fall and a hundred or more farmers saved thei hay in rainy weather that would have been lost otherwise. Mr. Joe Tiche nor reported the method to have saved him many dollars' worth o hay this year.

Tuberculin Test Required

In a study of 250 municipal milk ordinances, the Bureau of Dairying finds that one-fourth of these cities require that all milk, whether raw or pasteurized, must be from tuberculin tested cows. Three-fourths of all the ordinances require that all raw milk must be from tuberculin tested cows

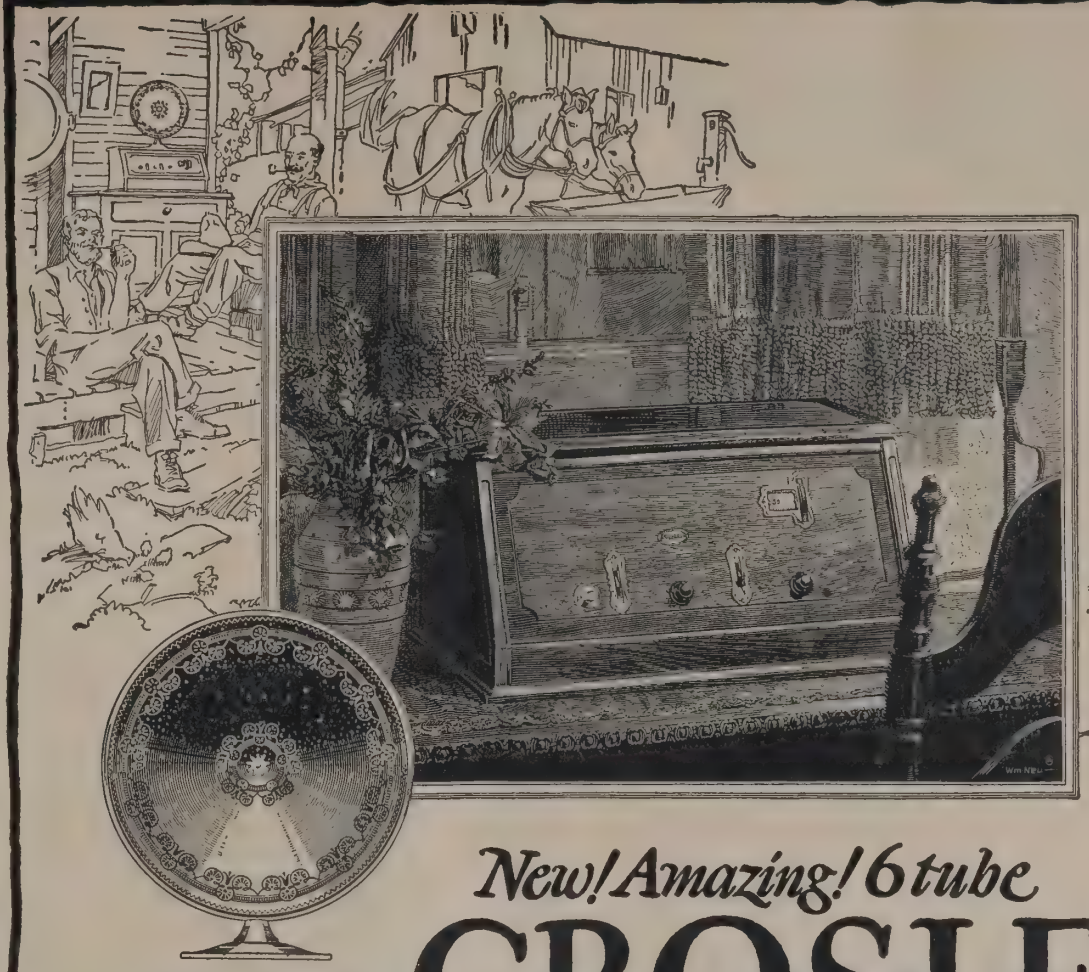
News From Washington, D. C.

[Special to Hoard's Dairyman.]

Washington, D. C., March 10—The daily press has carried the big news stories about what Congress did and did not do in its final days, but perhaps without emphasis on one important omission which temporarily paralyzes the effort which was made successfully to protect United States dairymen against the importation of unsanitary milk from foreign countries. The Lenroot—Taber Milk and Cream Import restriction bill was passed and signed by the President, but the appropriation which the Secretary of Agriculture must have to put the field agents at work to enforce the Act, failed in the second deficiency bill which was killed in the Senate filibuster.

The result of the failure to secure this appropriation, unless some other round-about way is found to secure the money, will be that the proviso which was added to the bill in its final hearing in the Senate becomes operative, and the secretary is directed to issue temporary permits, so all milk and cream will continue to come in as heretofore.

The administration of the act is placed in the hands of the Secretary of Agriculture and by him has been delegated to the Bureau of Chemistry which handles all of the so-called "pure food" laws. On July 1, this work all passes to a new administration, to be known as the "Food and Insecticide" Administration. The Bureau of Dairy Industry will not have anything to do with administering this act, except that it has been called in by the secretary to assist in preparing the necessary rules and regulations which are to be issued. The determination as to whether or not there is any money which may be made available for this purpose, now that the Second Deficiency bill carrying the necessary appropriation has failed, is under consideration between the secretary, the budget officer, and the Bureau of the Budget.



Besides filibustering the second deficiency bill to death, incidental to killing off the Reed Senatorial Election Investigating Committee and the Boulder Dam proposition, Congress passed the McNary—Haugen bill in its last ten days of work, and then accepted the President's veto without a chance or an effort to vote on the veto.

The National Dairy Union reports that news has been received of very favorable progress toward better oleomargarine legislation in Nebraska and Iowa and of an effort toward a similar law in Missouri. No news has been received here of the effort that was contemplated in Indiana to get a bill through to replace the one passed, and then lost—or perhaps stolen before it was signed—at the last session of the legislature.

If all of the cottonseed oil used in oleomargarine last year had been paid for in cash, so the cotton grower received the full amount and this was spread equally over the cotton acres, each acre would have received less than seven cents. This is reported as a summary from official figures compiled by the National Dairy Union. In a bulletin just issued by this organization it is stated that this sum—seven cents an acre—represents the only interest the American cotton grower "now has in the oleomargarine indutsry."

Medium: "The spirit of your wife is here now. Do you wish to speak to her through me?"

New! Amazing! 6 tube

CROSLEY

SINGLE DRUM CONTROL

RADIO

Distant stations louder and clearer—cut through summer static with this powerful 6 tube radio.

$60.

Folks who own this new Crosley set are going to enjoy radio as much this summer as in winter. 1927 summer broadcasting will be more extensive than ever. With this 6 tube marvel stations formerly in the far-away class become neighbors.

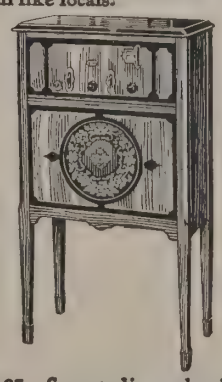
Crosley radio is *the* farm radio because farmers as a whole spend their money very carefully. They are business men. They have learned to look for value. Actual count shows more Crosley radios owned on farms than any other make.

This new set of Crosley is a wonder. Match it against any set of 6 or 7 tubes. The volume of its reproduction will keep radio a delight all summer.

Crosley radios are high in quality.
Finely finished cabinets, beautifully decorative in two tones and gold metal trimmings. Up to the minute single drum control. Easiest set on the market to tune.

Crosley radios are low in price,
because Crosley mass production methods permit spreading expenses over many units instead of few. Second cost is reasonable too, because battery consumption is unusually low.

See them at your Crosley dealers. Write Dept. ..... for descriptive literature if your dealer cannot supply you



THE CROSLEY RADIO CORPORATION

POWEL CROSLEY, Jr. President. CINCINNATI, OHIO.

Crosley sets are licensed under Armstrong U. S. Patent No. 1,113,149, or under patent applications of Radio Frequency Laboratories, Inc., and other patents issued and pending.

The CROSLEY MUSICONE
The finest loud speaker you can buy—not the costliest. Enormous demand has kept price at an incredible low level. Crosley patented actuating unit will reproduce sound perfectly. Volume is tremendous. 12 inch size, $9.75—16 inch size, $14.75.

The 6-60 is a beautifully finished 2-toned mahogany cabinet. All stations found with and written down on single drum. Acuminators find stations missed on ordinary single dial control sets. Crescendon brings distant stations in like locals.

The 6-85. Same radio mechanism as in table model 6-60. Same startling results. Same complete radio satisfaction. Genuine Crosley Musicone built in this pleasing console. Beauty of tone and fidelity of reproduction unmatchable. A rare value and a set that will give you pleasure for years to come. Price, without tubes and batteries..... $85

Stevens' Farm Holstein Sale

The dispersion of Geo. A. Fox's Stevens' Farm herd of registered Holsteins at Sycamore, Ill., Feb. 25, brought out an excellent crowd who wanted cattle and were willing to pay fair prices for them. Seventy-five head brought $12,635, an average just short of $170, and a good figure if one considers that it includes nine calves selling under $100. Five hundred thirty dollars, the top figure, was paid by Ensign Streever, Illinois, for King Colantha Reka, an 11-month-old son of one of Mr. Fox's foundation cows, Reka Beets of Rock, 31-lb. 3-year-old. Henry Albert of Illinois paid $500 for a 2-year-old son of the same cow.

Haeger and Mack did the selling.

Following are the averages for animals of the different age classes: Four bulls averaged $351; 18 cows, 4 years old or over, $189; 10 3-year-olds, $194; 17 2-year-olds, $167; 25 under 2 years, $107.

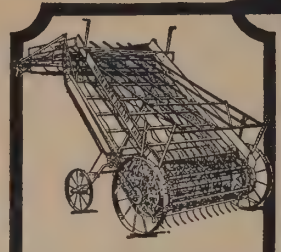
Rakes Dollars of Extra Profit Into Windrows

You get a better grade of hay by curing it properly, and you rake the hay clean without roping it when you use a

Rock Island No. 162 Combined Rake and Tedder

The only left-hand rake on the market equipped with divided cylinder. When either raking or tedding, the machine runs lighter and steadier, because it has six short tooth bars, giving six points of contact with the ground, where the ordinary combined rake of this type has only three long tooth bars. This six-point contact gives a steady pick-up of the hay, avoids shattering the leaves and results in smoother operation. It also prevents roping the hay, as each mower swath is handled individually.

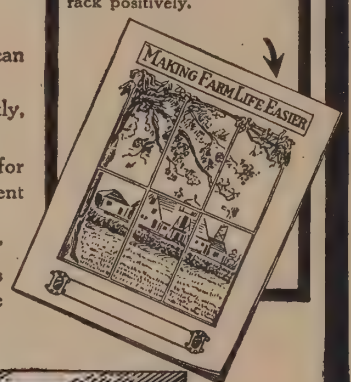


Exclusive Adjustable Cylinder Device

By means of a convenient lever, the cylinder can be raised or lowered to the necessary height.

The angle of the teeth can be adjusted instantly, or change made to either raking or tedding.

The No. 162½ Rake is designed especially for beans. Both are sold by Rock Island Implement Dealers.



FREE BOOK—"Making Farm Life Easier" describes this and other Rock Island Hay Tools that put more profit into your hay crop. Write today for free book C-60.

The Working Partner For Any Side-Delivery Rake

The Rock Island No. 158 Windrow Loader has an adjustable cylinder, which can be set to sweep the ground or to operate at any reasonable height to get clean hay without gathering trash.

Upper elevator can be lowered to start the load, and pushed up and locks automatically as load is built, delivering hay onto rack positively.

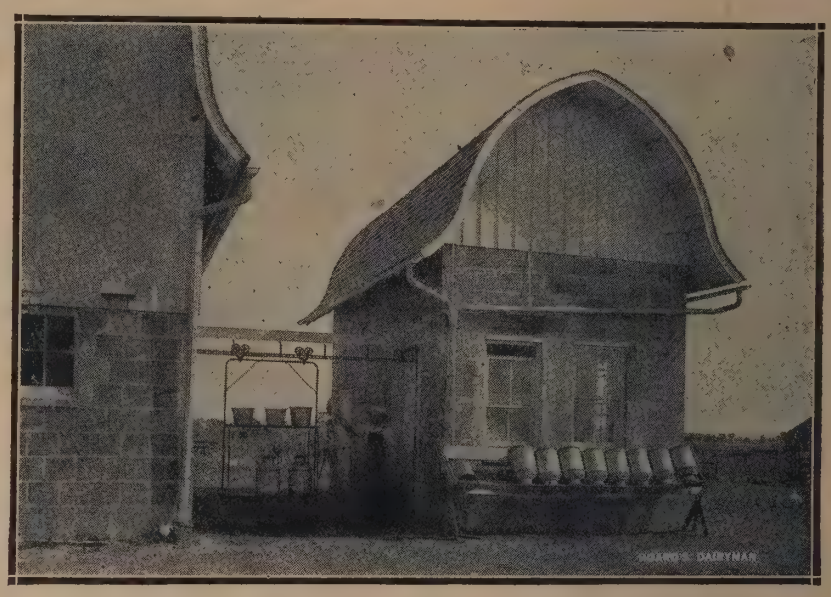
The Aim of City Milk Control

B. L. CRANDALL, NEW YORK

STANDING like a white sentinel, guarding the health and happiness of her and her family, the average American city housewife finds on her front porch or in her dumb-waiter every morning, a bottle of milk. A sufficiently commonplace occurrence it is to arouse little, if any, curiosity, but really typifying a progress on a par with any known to the world today, and a transformation, which, without any disrespect, can be compared with that of St. Paul.



Strange as it may seem, the innocent looking bottle of milk which the housewife seeks each morning as food for herself and her children, could once have been properly termed a messenger of death. Not unlike the early Saul who threw consternation into the ranks of the early Christians with his brutality and depredations, milk was once far from being the almost ideal food it is today. To it and water must go the credit or having been the carriers of the causes of more deaths and sickness than any other two agencies known to man.

Continuing the comparison, like Saul who became the Apostle Paul and thereafter went about doing good, milk has undergone a transformation, and is now a highly regarded member of the long list of foods which man likes. True, its transformation has not been as quick nor as complete as that of the ancient leader, and it still can undergo improvement. What still remains to be done, is important to both producer and consumer.

For centuries, milk has been regarded as a natural and health-giving food but also the carrier of germs which have caused widespread epidemics of typhoid fever, septic sore throat, diphtheria, scarlet fever, and other ailments. It now is under suspicion of being a carrier of other diseases. City health boards have formulated milk regulations that have produced quite satisfactory results, but there is much yet to be done if the consumer is to get what he wants—pure milk, sweet milk, and milk which he can use without fear.

Four words will state the aim of city milk control, or the effort to provide city residents with a good food. They are: pure, whole, sweet milk. Only a few more words will cover the method by which it is to be obtained, and the goal of health boards realized. They are: sound cows, healthy humans, clean utensils, and careful handling.

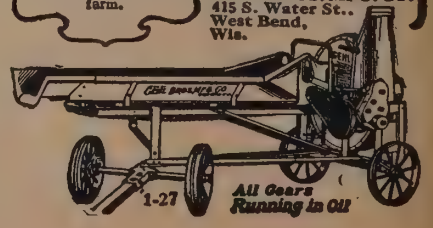
The desire to have good milk is not any different now than it was years ago, but the means adopted to get it have undergone many changes. The end of these is not yet in sight. Bacteriological and pathological researches are continually throwing new light on milk and how it must be handled in order to get safe food. Years ago, the practice of clipping and washing cows was unknown. Sterilization of milk pails and other utensils was not practiced although an effort was made to keep them reasonably clean. Investigation of the health of the humans who came in contact with milk was unheard of and the idea of cows giving dangerous milk, although apparently in good health, had not yet been born. These, however, are known today, and in the application of truths which the study of milk has brought out, lie the fundamentals of city milk control.

MILK HOUSE ON THE DAIRY FARM OF D. C. BENEKE, MINNESOTA

A concrete water storage tank on the top of the milk house furnishes water for the house, the barn, and the water trough around the barn.

City milk boards must be credited with having accomplished much toward bringing to the city consumer a better grade of milk than he had in days gone by. Nowadays we have no such mixtures as calves' brains, chalk, sugar, and water served up as milk, but milk still presents a problem and milk boards have a big field for action and a difficult goal to attain, if they are to secure for their consumers the safe milk which all want. Their aim should be to get a steadily better grade of milk, and in the light of more recent discoveries, the health of the animals which pro-

GEHL *Lightest-Running* **SILO FILLER**



Low speed means less power required, less vibration, hence longer life. The Gehl has all steel construction, non-breakable, boiler-plate fly wheel. Absolutely self-feeding. All gears enclosed—run in oil.

What a University Test Proved

A Gehl cut 19.26 tons per hour with only 13.26 H.P., elevating 35 feet and running 465 R.P.M.—the lowest power of any cutter in the test. It will do as well on your farm.

Auto Type Gear Shift for changing length of cut. Wonderful no-choke blower fills highest silos with low speed—3 H.P. and up will run Gehl cutters. Dealers everywhere — Write for name of nearest dealer.

GEHL BROS. MFG. CO.
415 S. Water St.
West Bend, Wis.

duce the milk and of the humans who handle it on its journey to the consumer, should receive especial attention.

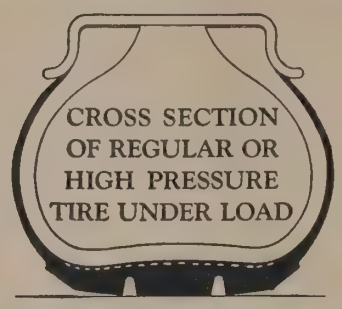
Much is being said nowadays about tuberculous cattle. They present a menace to milk supplies, but not as great as many would believe. Humans, and especially those over 16 years of age, are not especially susceptible to bovine tuberculosis. Careful investigations which have been made show that only 1.5 per cent of all adults over 16 affected with tuberculosis have the bovine variety. However, this percentage is great enough to warrant a careful checkup of all cows whose milk is used by human beings.

Accepting the premise that it is the aim of city milk control to provide safe and whole milk, milk boards can well afford to require more frequent examinations of the cattle which are supplying their respective cities. The usual plan of yearly physical examinations is not sufficient as it is entirely possible that in the 12-month gap for a cow to develop some ailment which renders her milk unsafe for human consumption. The dairyman cannot always be depended upon to remove from the herd an unfit animal, or to keep her milk from being put in with that from the rest of the herd. One milk company which serves a big metropolitan area has come to realize this fact and is considering the employment of a veterinarian to make daily examinations of cattle supplying its highest grade of milk. If the middleman has seen the light, surely it cannot hurt the milk board with its larger responsibilities.

As great as is the need of clean, healthy animals however, the need of healthy humans handling milk is equally as urgent. The need of preventing people from coming into contact with milk, who have communicable diseases in their homes or families, has been given attention, but it should not end there. City milk boards should look into the health of milk handlers more carefully and not stop where they have. Another step should be taken which is similar to that taken with the cows themselves.

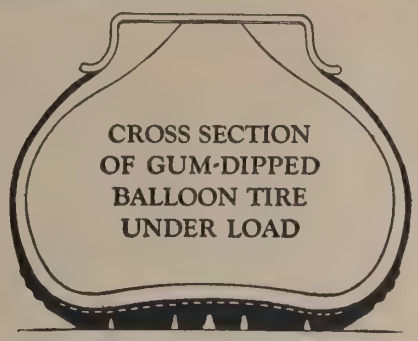
If it is good practice to examine the cattle, it is equally as good and probably more effective, in getting safe milk, to examine all who handle it. Among humans there are those whom the medical and biological professions term as carriers. These people have in their systems the germs of malignant diseases that do not fall victims to them themselves. There are cases on record where milk consumers in large numbers have become ill with no apparent reason. When a careful investigation was made, it was found that some handler of the milk, before it was bottled, was a carrier of these germs and from him was coming the trouble. All who handle milk in any way should be subjected to careful examinations and if found to be carriers of disease germs or in frequent contact with them at home, they should be prevented from handling milk which ranks as more naturally susceptible to contamination than any other food.

Contrary to early beliefs and the subject matter of numerous scientific papers of days gone by, milk does not come from the cow in a sterile condition. Freshly drawn milk contains germs of various kinds, but these may not be particularly harmful. The fact that milk is not only food for humans but also an excellent food or medium for bacteria, is where the trouble lies. Absolute cleanliness and health are essential to safe milk, but even with these trouble may arise.



Pasteurization of milk appears to date as the best way of safeguarding it for human consumption. This treatment of milk is not particularly intricate or expensive, but it requires accuracy and skill. For the individual dairyman, pasteurizing machinery is prohibitive and it is doubtful if he could operate it efficiently if he had it, but milk boards should give thought to ways and means of having milk, which reaches their consumers, pasteurized before being bottled.

The process of pasteurization does not affect the food value of milk nor does it affect its taste if done properly. It does, however, destroy the bacterial life which, if it comes into contact with the internal organs of human beings, may cause many difficulties. It is a means of making a clean, wholesome milk safe. It is the chief aim of city milk control.



For the first time in his life, Bobby saw a flounder.

"Look, ma," he cried excitedly. "Look at that funny fish! He's got a flat tire!"

Scientifically Designed BALLOON TIRE TREAD

THIS type of tire rides more directly on the wide rider strip at the center of the tread. That is where the weight and wear come, so that is where extra rubber is needed. The walls and tread of this tire are thick and stiff, making necessary the use of large tread design for high pressure tires.

THIS type of tire—low pressure Balloon—carries the load on a wider surface, therefore grooves are cut directly in the center of the Firestone Tread to permit easy flexing. Greater amount of Rubber is placed at outer edges of tread where most of the load is carried. Instead of large, heavy rider strips and projections which retard flexing and cause skidding, the Firestone Tread is provided with small projections and narrow rider strips which increase flexibility and give greater safety and skid-protection.

Another Reason why— Firestone Tires are Better

When Firestone engineers were developing the Balloon Tire they found it necessary to design a tread altogether different from that which is required by High Pressure Tires.

The Firestone tread was not designed with large, massive projections for appearance or to make plausible sales argument. On the contrary, the projections of the cross-and-square tread are small and the rider strips narrow permitting the tread to yield to irregularities and cling to the road, giving the greatest non-skid surface. This tough, pliable tread has the wear-resisting qualities that give thousands of extra miles of service.

The tread, however, is not the only important part of the Balloon Tire. Such a tread as this, designed to yield to every depression of the road, must be placed on the carcass that also has the qualifications to withstand the terrific flexing that this design tread permits. Firestone provides this extra strength and endurance by dipping the cords of the carcass in a rubber solution. By this process, every fiber of every cord is saturated and insulated—to withstand the extra flexing of the Firestone tread.

If you want the economy, comfort and safety of Gum-Dipped Tires—see the nearest Firestone Dealer. He will gladly explain the many features that make Firestone Tires better.

MOST MILES PER DOLLAR

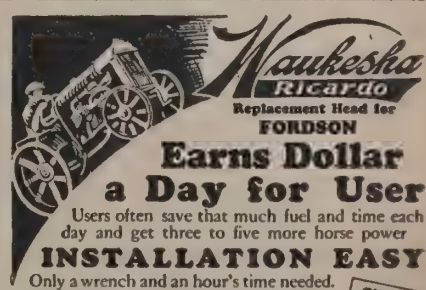
Fair Echoes

Said the Guernsey to the Holstein,
"Don't you wish you had a suit
In colors swell, of red and yellow,
Trimmed in white to boot?"

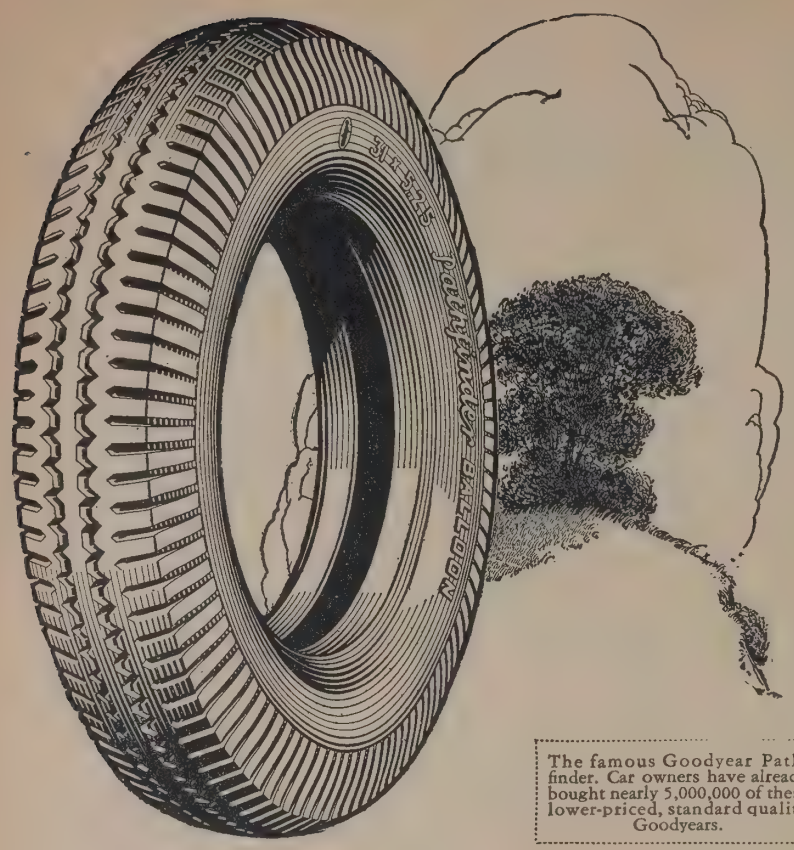
Said the Holstein to the Guernsey,
"Don't you know, my brown-eyed pet,
Colors bright have gone toboggan,
Now they're wearing white and jet?"

Said the Guernsey to the Holstein,
"I'm descended from the bull—
Rushes mentioned in the Good Book,
Growing down by Pharaoh's pool."



Said the Guernsey to the Holstein,
"Your old milk's so thin and blue,
Though you fill the pail to brimming,
Still the bottom tin shows through."

Said the Holstein to the Guernsey,
"Let me put you in the clear,
No one needs a pail to carry,
All the milk you give, old dear."



Just then Farmer Brown came running,
With the judges' records true,
Pinned on each contented beauty,
Banners gay and ribbons blue.

Side by each they trod the show ring,
Champions both, for all to view,
Homeward bound they joined in singing,
"Bossy, dear, I'm proud of you."

Iowa. H. J. RYNER.

The famous Goodyear Pathfinder. Car owners have already bought nearly 5,000,000 of these lower-priced, standard quality Goodyears.

It can not be mailed

One of the biggest benefits to you of the Goodyear policy can not be sent through the mail.

It is the *service* performed for you by the local Goodyear dealer.

He recommends to you the right size and type of tire for your car. He puts it on the rim for you. He fills it with air.

After the tire is in use he helps you give it the care it should have to deliver the maximum results.

This service means money in your pocket. It cuts down your tire bills. It is something you ought to have.

It is part and parcel of the Goodyear policy: *to build the greatest possible value into Goodyear products,* and *to provide facilities so that the user can get all this inbuilt value out.*

Goodyear makes a tire to suit *you*—whether you want the incomparable All-Weather Tread Goodyear, the most famous tire in the world, or the lower-priced Goodyear standard quality Pathfinder

Manufacturing Buttermilk Powder

MEEKER County, Minnesota, has always been quick to adopt new methods of dairying. Being fortunate in having dairy farmers and citizens who are dairy-minded and possessed with dairy leadership, it was one of the first counties to build modern co-operative creameries and equip them with improved machinery.

Farmers, bankers, merchants, and manufacturers all work together in that county to develop a well balanced agriculture, and the cow fills an important place. When the leaders were convinced that better butter could be made from sweet cream, it was not long before a considerable number of the creameries were making sweet cream butter and were distributing it through the Land O' Lakes Creameries, Incorporated.

When the creamery managers whose creameries were making sweet cream butter learned that buttermilk could be made into powder and sold, they were not long in getting their heads together to find out whether it would be a profitable adventure to construct a building and equip it with the necessary machinery for evaporating buttermilk. The building is located at Litchfield near one of the oldest and most successful co-operative creameries in Minnesota. This building was dedicated last November and from that time to this has been receiving the buttermilk from sixteen co-operative creameries. It is first passed through a separator for the purpose of recovering any fat that might have been lost in the buttermilk during the churning process; then it is made into powdered buttermilk and put in barrels and sold to bakeries and other institutions. Trucks are used for collecting the buttermilk from these sixteen factories.

A PLANT ERECTED BY SIXTEEN CO-OPERATIVE CREAMERIES IN MEEKER COUNTY FOR MANUFACTURING BUTTERMILK POWDER

The enterprise has not been under way long enough to state how profitable it will be. We are informed by the president of the Land O' Lakes Creameries, Incorporated, Mr. Brandt, and who is a farmer in Meeker County, that so far results have been very satisfactory.

Old Colantha

HOARD'S DAIRYMAN:—One-half of the Holstein herd on the University of Idaho farm at Moscow traces directly to Alaska Yukon Colantha, better known as "Old Colantha." This grand old cow, now 17 years old, has given birth to 14 calves, six of which have been females, and she now has five generations of descendants as stable mates. Although $2,845 worth of stock sales tracing directly to her have been made, there are still in the herd three daughters, four granddaughters, ten great-granddaughters, five great-great-granddaughters, and one great-great-great-granddaughter, making six generations in all. There will probably be a seventh generation before old age claims this mother of record makers. Her last calf is a great-great-great-aunt of the aforementioned great-great-great-granddaughter, although they are the same age. She is due to freshen again in November and has already been allowed to go dry in order that she may preserve her strength.

Colantha was purchased as a two-year-old from William Bishop of Washington. She is by Colantha Johanna Lad, the bull with 140 Advanced Register daughters and more granddaughters with 800-pound records than any other known sire. Her dam, Mita Clothilda P., has a 94-pound milk record in one day. Colantha was not put on official test until she was 12 years of age but she produced 15,000 pounds milk and 488 pounds fat in the year. She did this with two quarters as she lost the use of one-half of her udder when she was seven years old. The original

ALASKA YUKON COLANTHA, "OLD COLANTHA," 17-YEAR-OLD COW OWNED BY THE UNIVERSITY OF IDAHO

She is still producing and now has five generations of descendants for stable mates.

vestment of $150 has multiplied it-
lf many times in the fifteen years
at she has been in the college herd,
r the stock now in the herd direct-
tracing to her was recently val-
d at more than $2,900 by Professor
W. Atkeson, chairman of the col-
ge dairy department. She has been
ilked 3,962 days during which time
e has produced 135,123 pounds
ilk and 4,540 pounds fat. If this
ilk were valued at $1.50 a hundred-
eight, she would be credited with a
,026.50 check for milk alone. Her
verage daily milk record for every
ay she has been milked is 34.10
unds. This cow and her offspring
lustrate what can be done in the
ay of building up a profitable sized
airy herd from one or two good
are-bred females when tested sires
e used.

Colantha's first granddaughter to
eshen, Idaho Matador Dutchess,
roduced 16,280 pounds milk and 542
unds fat at two years and eleven
onths. One of Colantha's most il-
strious sons is Idaho Piebe Hero,
e main herd bull in the Idaho State
dustrial School barns.

Wisconsin. G. A. PETERSON.

Don't Quit

hen things go wrong as they sometimes will,
hen the road you are trudging seems all up hill,
hen funds are low and the debts are high
nd you want to smile but you have to sigh,
hen the care is pressing you down a bit,
est, if you must, but don't you quit.

Knowing Cows as Individuals

HOARD'S DAIRYMAN:—There is too
uch difference between the average
w and the best cow and a great deal
f this poor production on the part
f the average cow is due to the lack
f an understanding of each individ-
al cow in the herd. As an illustra-
on of this fact we would like to
ention Mr. E. S. Bird of Kentucky
nd the records that he has made
ith his cows. He joined the cow test-
g association in Kenton County four
ears ago and stayed in it as long as
e association lived which was about
ne year. During the period that the
w tester came to his farm he found
at he had a pretty good herd of
ws and that he was able to get a
rger production out of them than
er before because of the test work
at he was doing.

His experience in cow testing
owed him that each cow required
little different care and attention
om anything that he had given to
er in the past. This led him to be-
eve that he might have cows that
ere good enough to go on official
st. Accordingly he started official
sting three years ago and since then
as achieved great fame with his
erd. The first six cows that he offi-
ally tested produced an average of
11 pounds fat for the year and won
igh honors with the A. J. C. C.

The old grandmother cow that
ade a record of 616 pounds fat had
daughter that made on her first test
a four-year-old 14,515 pounds milk
nd 806 pounds fat and she in turn
ad a daughter that made 13,400
unds milk and 734 pounds fat as a
vo-year-old. This gives one strain
ithin his herd three generations of
igh producers and he has concen-
ated his efforts toward saving heif-
calves from that strain.

He tested the four-year-old cow
entioned above again as a five-year-
d and as he understood her likes
nd dislikes a little better than he did
e first year he was able to finish
is cow, Torono's Adelina 456566,
ith a year's test on April 10, 1926,
s the state champion butterfat cow
ny age, any breed, with a production
15,770 pounds milk, 873 pounds fat.

We can say that the cow test association started Mr. Bird off as a first class dairyman, capable of getting a high yield out of his cows and thereby making a better profit than he had ever made from his herd. Undoubtedly the cow testing association can do the same thing for every member of a cow test association in America.

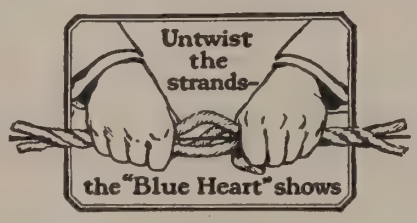
F. RASSMANN MANUFACTURING COMPANY

41 Rowell Street BEAVER DAM. WISCONSIN

For farmers whose time is money

A valuable new book on the use of rope. Send for it!

Cumbersome knots and hitches—difficult to untie—slipping at critical moments—requiring constant retying. How they do eat up the time which means so much on the farm!



And the rope itself—so easily ruined when it is not given proper care.

Avoid these losses. You can, with our new 58-page illustrated booklet, "More Jobs from the Same Rope." This interesting and valuable book tells you how to make the very best knots and hitches, how to save rope by splicing, how to care for rope, etc.

Send for *your* copy today! Mail the coupon below, with 15c—a fraction of the book's cost.

H.&A."Star Brand" Binder Twine

evenly spun from the best fibres — has full yardage, ample strength for binding purposes, and is treated against destruction by insects.

How to know good rope before you buy it

The better quality your rope is to begin with, of course, the greater will be your saving. Here's a sure way to know really *good, long-wearing* rope, before you buy it:

Untwist the strands of the rope. If you find a blue thread marker—the "Blue Heart"—running in the center between the strands, you may be sure that the rope is genuine H. & A. "Blue Heart" Manila Rope.

Spun by rope makers with over half a century's accumulated experience, this thoroughly good rope will wear longer and deliver maximum service in any size, on any job. For the selected fibres of H. & A. "Blue Heart" Manila Rope are drawn, spun, laid, and properly lubricated so as to insure the smooth working of every fibre, yarn, and strand.

Before you buy rope, untwist the strands and look for the "Blue Heart"—our registered trade mark. It assures you of dependable rope value not only on the first purchase, but whenever you need more of the same kind.

Forming A Unity Dairy Organization

HOARD'S DAIRYMAN:—Attempts are being made to form what is called a Unity Dairy Organization. This should not be confused with the committee that is holding hearings preparatory to making a report on a state-wide organization. The former had its origin in a meeting called by J. J. Dillon after the committee referred to had been appointed. This committee is frequently called the Ten Eyck Committee, as Mr. Ten Eyck is its chairman. The Unity organization has gone far enough so that Mr. Dillon called together the heads and some interested members of those groups not affiliated with the Dairymen's League or the Sheffield producers and they appointed certain directors and a president. The president is Truman Cole. A meeting was held in Binghamton at which Mr. Cole was the principal speaker.

The local chairman, Mr. Quinn, first went over the situation somewhat, saying that they were trying to save the dairy industry, and that they desired to operate at a low cost. They propose to have 24 directors each elected for one year. It is proposed to have directors elected each year by delegates from the locals of that particular district. Any help that is to come to farmers, he says, must be by the farmers themselves. Nothing can be done by legislation, he thinks. He praised President Coolidge for his veto of the recent farm relief bill. He then introduced Mr. Cole. He accepted the presidency of this organization because he wants to see farmers getting living prices for milk. Said he had been called the most uncompromising opponent of the Dairymen's League Co-operative. This organization has started out to do what the old Dairymen's League Inc. began back in 1916. He tried not to show antagonism to the present League or the Sheffield producers but he, by inference at least, laid the present low prices at the door of the League with the Bordens in its control, and he didn't give the Sheffield producers' association any credit for making conditions better. High salaries and good jobs for some seemed to be a somewhat sore spot with Mr. Cole. He used no ugly terms or expressions but he did show strong disapproval of what has been done before.

In one sense he offered some praise and gave some credit, for he holds that this new organization is to supply the only thing lacking to a strong three-legged stool, the Borden-Pool, as he was pleased to call it, and the Sheffield producers being the other two legs. The Unity is to operate on one cent a hundred or less, but local people are to take care of their local expenses and their own surplus. Members may be by locally owned plant associations or by groups where farmers do not own plants. Each is to sell its own milk, but not at prices lower than those set by the executive committee or the directors. It appears that it is the hope to have a central salesman to help those who need it. He claims not to understand much of marketing milk but hopes to learn.

The speaker tried to explain how at Little Falls they are attempting to equalize production throughout the year by a system of penalties and premiums, but as yet they get 400 cans per day in the shortage season and 1,300 cans in the flush. However, they have been able to return to their farmers there $50,300 above what the "pool" would have given them. He digressed to show how some dairymen at that point get $240 income per cow while others get only $70. They hope to educate all to bet-

What Is Back of the Claim?

Any one can make a claim. But a claim is meaningless unless it is backed up by performance. Results are achieved only after definite planning. Fisk Tires have proved their worth, their value. Today Fisks are original equipment on a large proportion of the country's new automobiles. r dairying. There is no holding embers in the new organization ept as they are to stay to fulfill con- acts made for their sales. If the ganization is good no one will want draw out of it. It would look as ough there is a very worthwhile ork for these people if they can ally organize these groups that retofore have apparently failed to ganize.

Director A. L. Milks of the Dairy- en's League was present and spoke ry encouragingly of any attempt get all dairymen united. The eague, he declared, would be very ad to co-operate with any organi- tion in an attempt to stabilize milk ices, as that is what they were or- nized for and have been trying to . He did not think it wise to ange directors every year but be- ves the one-third yearly election tter. Then he thinks it better to ve the entire membership vote for ery director rather than to leave it for the one representative from ch local in each district.

New York. H. H. LYON.

To Cure Overproduction

HOARD'S DAIRYMAN:—The farm- s' dilemma compared with the pre- sterous business conditions in gen- al appears somewhat in the posi- n of a stepchild, although a giant proportions. Farming is ailing ite noticeably in spite of the bul- ins issued to the contrary. Some vice published recently advocated eight-hour day for farmers to ve the ills, to produce less, which the most essential of any theory d the only one that has been ad- nced to alleviate the general farm- s worst pains.

Such advice has pulled farmers' tes, but the general farmers today still holding the sack with noth- much in it but a lot of warm air d up to use as a cushion to sit on d think it over. When an adviser d director of a state agricultural periment station makes such state- nts he does not seem to realize t the farmer's occupation is de- ident on all sorts of weather and old other circumstances.

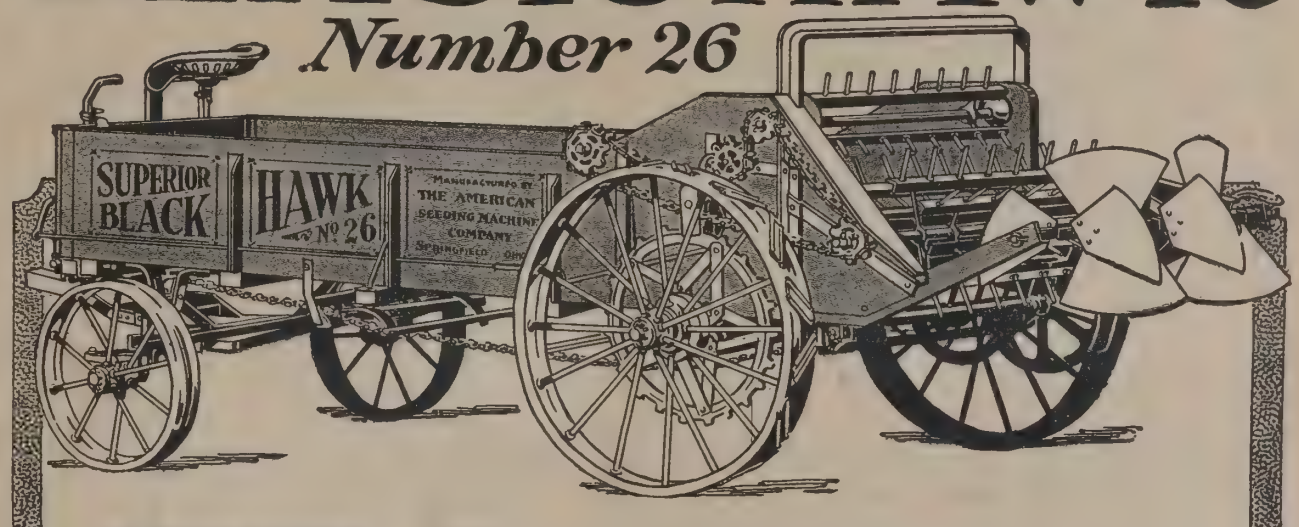
Farm work cannot be handled like tory operations, and the man who make a success with same on an ht-hour basis will have to show us. e suggestion to the farmer to take asy and produce less is sound ad- e, but not by adopting an eight- r day, for this is out of the ques- n under general farming condi- ns. Now, why not suggest another n to cut out overproduction—one t will not endanger the nation to nine and famine prices—which be done by concerted action by farmers in the U. S. A. in a way produce more from an acre of d, with much less expense, by ar- ging a system of labor, having h farmer to do the greater part of work without the aid of outside p, by tilling two-thirds of his land resting one-third each year. By ng the summer fallow method on one-third of land you are able get it ready for the next season's p by plowing in June, soon after ing seeding is completed. This d should be cultivated several es during the summer, thus killing old numbers of insects and weeds increasing the fertility of the with less work.

uch a system would check over- duction and quite likely improve n prices by regulating, to a cer- degree, supply and demand. v, to make a long story short, ice it to say the great agricultural it has been ill for quite a number years, with a bad case of overex- on, resulting in nervous disability sing stagnation of circulation and ture of the main arteries. The patient is still lingering and pining between hope and real help—although many prescriptions were compounded free of charge with an eye for business later; other concoctions and brews were cash in advance, but, sad to say, mostly in advance. Would it not be well to change doctors and doctrines? It might even be advisable to detail a delegation of real experienced and practical wide-awake tillers of the soil with business ability to study a system of pooling farmers' grain for distribution.

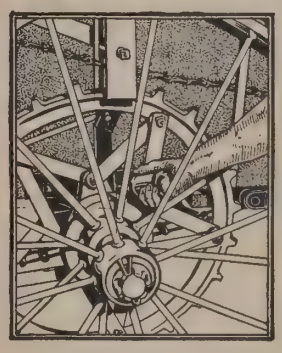
Sad to say, it seems a dark and unsolved problem why so few of our professional farm papers and magazines contribute so little real practical and experienced suggestions or cast light on American agriculture's most vital problem—too much political bunk cover the various issues.

Michigan. M. W. HYENGA.

Another 1000-lb. Fat Producer



The Holstein-Friesian Association of America announces that the 111th Holstein cow to produce above 1,000 lbs. butterfat in a year has recently qualified for this honor with 28,305.9 lbs. milk, 1,015.11 lbs. fat (1,268.88 lbs. butter) produced in 353 days. This cow is Sequim Ellen Canary, bred by E. F. Gierin, Washington, and owned by the Carnation Milk Farms in the same state.



Feminine Arithmetic

The Boss's Stenographer (telephoning a girl friend): "I'm thrilled to hear you're engaged at last. I've always said a ring on the finger is worth 10 on the 'phone."—The Progressive Grocer.

SUPERIOR
BLACK HAWK
Number 26

Alemite Lubrication

THE new SUPERIOR-Black Hawk No. 26 Manure Spreader has all of the famous Black Hawk features with many new ones added. No other spreader works as efficiently or is so easily handled.

A thin top dressing or a heavy spread of manure requires only the simple pressure of a lever. This new manure spreader does not merely unload or dump manure on the hit-and-miss plan, but thoroughly shreds, pulverizes, and spreads it evenly over a wide surface, literally carpeting the ground in quantities of 4 to 28 loads per acre.

The SUPERIOR-Black Hawk has the lightest draft and the shortest turning radius of any spreader on the market. Easily handled by a two-horse team and operates as effectively on hillsides as on level ground.

An inspection of this spreader will convince you of its scientific design and durability of construction.

The SUPERIOR-Black Hawk is equipped with an Alemite oiling system—all the principal bearings are fitted with Alemite cups and a 1500 pound pressure gun is furnished with each machine, which makes it easy to keep in perfect condition.

A COMPACT UNIT
for Washing and Sterilizing Bottles

A REAL TIME and LABOR SAVER

BUILD up the reputation of your product by delivering only in bottles which have been washed and sterilized in your own dairy. It pays.

And do it with the No. 9 Fort Atkinson Washer and Sterilizer shown above. Everything is handy. Without moving a step the operator stands at the machine and cleans 500 bottles or more per hour. Only one handling of each bottle. Rinsing and sterilizing practically automatic.

This is just one of the many *CP* aids to profitable dairying. We specialize in milk house equipment. Write headquarters about your problems. 320-page catalogue FREE.

THE CREAMERY PACKAGE MFG. COMPANY
1245 W. Washington Blvd., CHICAGO, ILL.

Starving Cattle in a Land of Plent

LAST summer in July we were riding with Paul Johnson, county agent, in Rice County, Minnesota. Suddenly he yanked his car up by the side of the road and said, "Look at that! Starving cattle in a land of plenty." Over the fence was a bunch of thin dairy cattle fighting flies and wondering where the next bit of grass was to come from. On the opposite side of the fence along the roadside was a luxuriant growth of sweet clover.

Since that time Paul has been building arguments for that part of his county program that seeks to promote the welfare of the dairy cow. A month ago he sent us a sample of the kind of persuasive ammunition he is using this year. It is timely; it is sound to the core. What he has to say follows:

"One creamery pays 48 cents a pound for butterfat and another creamery pays 49 cents. That's only a cent difference; not worth hollering over; not worth leaving your creamery for; not worth making one co-operative creamery a competitor of another.

"In this county I have the feed cost figures for a year on two herds of cows. The feed cost per pound of butterfat on one farm was 16 cents; on the other farm it was 32 cents. A difference of 16 cents a pound is worth hollering about. Who should do the hollering and what should he make the noise about?

"There is no secret about the cause of this difference of 16 cents a pound. One farmer had all the home grown alfalfa hay and silage his cows would eat. He fed a grain mixture of equal parts of ground oats, barley, corn, and succotash at a rate of 1 pound for each 3½ lbs. of milk produced. During the summer he had good sweet clover pasture. He fed a little grain even on this pasture. His cows averaged 346 lbs. of butterfat. He had lots of skimmilk to feed to his calves, hogs, and chickens.

"How about the other fellow? His cows averaged 206 lbs. of butterfat. His cows came off a burned up, eaten up bluegrass pasture in the fall too thin for fall freshening. During the winter he fed corn fodder, silage, and timothy hay. He fed ground corn, oats, bran, and linseed meal. He bought his protein and fed sparingly of it.

"We have 30,000 dairy cows in Rice County. We have only about 5,000 acres of alfalfa or 1 acre for 6 cows. It should be one acre each cow.

"We have two cow testing asso tions in Rice County with a memb ship of 40 herds. We have 1, herds in the county that should be cow testing associations. One herd 40 is in association work.

"We have about 3 herds out o headed by a pure-bred dairy b The scrub or grade sire never proved any herd. Rice County is porting good pure-bred dairy sires the hundreds; we need more of th at home.

"The average production of R County cows is about 186 lbs. of terfat a year. The average pro tion of cows in cow testing asso tions is nearly 300 lbs. of fat a y

"What is the solution of this p lem? Should we holler about the cent difference paid by creameries the 16 cents difference paid by cows when given a chance?

"No other crop is so necessary success with dairy cows as alfa no crop returns as much per when fed to good cows. In R County it costs less than $8 a to grow it. This winter dairymen w paying $25 or more per ton shipped in hay. Is it good busin to export our good dairy bulls import alfalfa hay? Home gr alfalfa hay is best; it is finer stem and leafier. Growing alfalfa bu up the soil; it increases corn small grain yields; it adds to the ue of your farm. You need one a of alfalfa for each cow.

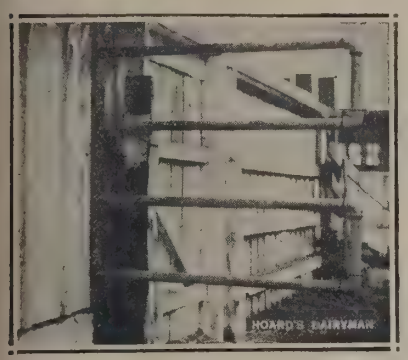
"Is it good business to use 3 a of bluegrass pasture for 1 cow w we could graze 2 cows on 1 acre sweet clover pasture as some already doing? Sweet clover see cheap; the crop fits in with the tation of other crops; the growing it frequently adds several bushels corn to the succeeding corn c Sweet clover is good cow pasture; use of it helps one to put his c in winter quarters in better co tion; cows like it.

"Is it good business to main 30,000 dairy cows in Rice County an average production of 186 lbs fat or a total of 5,580,000 lbs. w we could get 5,800,000 lbs. from 000 cows if all our herds were in testing associations? The ye maintenance cost of these extra 000 cows is around $400,000 a and this divided by the 1,600 d herds in the county amounts to $ each a year. It costs about $4

THE VALLEY GEM GUERNSEY HERD SIRES IN YOKE DRAWING A WAGON LOAD OF HERDSMEN AT THE 1927 PACIFIC INTERNATIONAL

O. M. Plummer, manager of the show, is the man with the bull whip and the meditative expression. John E. Wrage, one of the owners of Valley Gem Farm, is seated on the edge of the rack.

The bulls, which have been doing farm work since they were calves, were given a dynamometer test of 1500 lbs. at one of the fairs last fall. This is equivalent to pulling three 14-inch plows at a depth of 6 inches.—The American Guernsey Cattle Club.



year to keep a herd in a cow testing association. You can subtract $40 from $250 and put the $210 in your pocket if you have the $250 to begin with. Let's get the $250 for each herd in Rice County by lopping off the maintenance cost of the extra 10,000 cows—the ones that are below 186 lbs. of fat a year."

Paul Johnson is not talking through his hat. He is not talking about something in a far off county. All the evidence supporting his statements may be found in the county in which he proposes to effect a program of improvement.

What he has so forcefully said about improving the production of dairy cattle in Rice County applies with equal truth to hundreds of counties whose farmers are striving to make a substantial part of their income from dairy cows.

Making the Bull Safe

HOARD'S DAIRYMAN:—We have eight registered bulls in our herd and each of them will bear close watching. In fact it was due to several near accidents that we were at last

A SAFETY DEVICE FOR BULL PENS

aroused to the necessity of working out some safety device before someone would get hurt or killed.

Each bull pen has two compartments—a box stall and an exercise yard. These are connected by a doorway about 7 feet high by 3¼ feet wide. It was this doorway, or rather the door, that gave us most trouble and caused most of the danger. Almost every time it had to be opened or shut someone had to slip into the stall to clear away the litter and straw before it could be fastened. Whoever did this took chances with the bull. Anyone who has had experience with bulls knows that this is a very dangerous thing to do, yet men who do it every day are inclined to become careless.

This danger was increased in our case by the fact that the doors were frequently broken down, sometimes knocked clear off their hinges and had to be fixed with the bull an interested spectator. That's the trouble with a bull pen door that is swung on hinges at the side. A swinging door is always an invitation to a bull. Like some boys, he dearly loves to slam a door.

Our first step toward a safety device was an attempt to fix the door so that it could be closed without going into the pen, and so that the bull could not butt it to pieces. Our first efforts in this direction failed completely, but out of these efforts came the idea of using cross bars that could be operated from the outside of the pen.

The plan finally worked out, and put into operation in four of the bull pens, is shown in the accompanying illustration: To install this device the door jambs were reinforced with new 2x8-inch planks of southern pine. Four 2-inch auger holes were then bored through both door jambs and the outside wall. These holes must be in perfect alignment to allow free and easy movement of the one and seven-eighths inch galvanized iron pipes of which the bars are made. As shown in the illustration, the outside ends of the pipes are connected in pairs. This affords some stability and furnishes a handle with which to operate two bars at the same time. In opening, the bars should be drawn just enough to clear the doorway. If drawn clear out of the door jamb there is apt to be difficulty and delay in getting them back into place. We have found that although the bars are close fitting they can easily be operated with one hand if the holes are kept greased.

This device has now been in operation almost a year and has given complete satisfaction, and so far without injury to either man or bulls. In other words, we have found it bull-proof, foolproof, practical, and safe.

Care and Handling of Milk

We have examined a new book on "The Care and Handling of Milk" by Harold E. Ross, professor of dairy industry, New York State College of Agriculture. The book is intended as a text for dairy students and as a guide for all who are interested in the care and handling of milk, and in its use as a food. In preparing the book the author has made frequent reference to the latest investigations along the several lines discussed. Parts of the book will be of special interest to those interested in human nutrition, to producers of milk, to distributors, to milk inspectors, to managers of dairy plants, and to consumers. Of special interest to producers are chapters discussing grades of milk, the production of clean milk, and methods of cooling milk.

Copies of the book may be secured from Hoard's Dairyman Book Department. The price is $3.00 a copy postpaid.

Get a Hook

A little girl at dinner table was given a dish of noodles. The mother noticed that she was eating nothing but the soup, leaving the noodles. She asked her why she did not eat the noodles, too.

Unconcernedly she answered, "Can't catch 'em."—Christian Evangelist.

"Try an' burn it!"

A building man's advice to shingle buyers

THE blow-torch knows why some shingles are called "fire-safe," and others "fire-proof." It quickly points out the difference between so-called "enduring" shingles and those that are truly "everlasting."

Turn its truth-searching blast on a Johns-Manville Rigid Asbestos Shingle. See for yourself the kind of fire resistance, the real everlastingness these rigid slabs of permanence will bring to your roof. Before you choose a shingle, "*Try an' burn it!*"

A WONDERFUL SUCCESS

"Nothing succeeds like success," they say, but where success is constant and increasing there must be some unusual merit back of it. The continued success of the **Auto-Oiled Aermotor** is based entirely on merit. It has been made better and better year after year. Improvements have been added as experience has shown the way. The **Auto-Oiled Aermotor** of today is a wonderfully durable and efficient windmill.

The Aermotor Company, more than 12 years ago, solved the problem of complete self-oiling for windmills in such a way as to make the system absolutely reliable. The oil circulates to every bearing and returns to the reservoir with never a failure. There are no delicate parts to get out of order. The double gears run in oil in a tightly enclosed gear case.

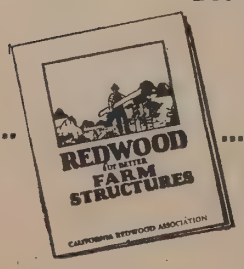
The Severest Test *for* Lumber

Redwood is always selected for this purpose

In California are used vats for curing certain types of fruit.

These great vats are constantly filled with caustic soda, acid or brine. Year after year they serve this purpose.

Even the iron bands around them must be replaced. But the vats themselves last indefinitely. Some of them twenty years old or more are still as sound as the day they were constructed.



California Redwood is always used for these vats. It is the one wood that stands up under this severe test.

For Redwood is impregnated by Nature against rot and decay. It brings long life to buildings in which it is used.

It is easy to work, stays put. It is hard to ignite and slow to burn. Use durable Redwood and build for generations.

The complete and romantic story of this valuable wood is told in our practical new book, "Redwood for Better Farm Structures", which we will gladly send you *free* on request.

What I Am Trying To Do on My Farm

The Farmer in Community Life

W. J. DOUGAN, WISCONSIN

IT has been a tendency of the farm to create in the minds of the farm family a sense of isolation. The farmer was alone in his fields, alone with his stock. When the curtain of night drew down the farm family was alone in its little circle.

The very abundance of the farm has developed in the rural mind a sense of self sufficiency. The farmer has been able to provide the necessities of life for his family. In the homespun days the children made their own kites and wagons and toys. The women folk manufactured from the raw material luxuries in food and finery in apparel. But those days with their blessings and their handicaps have contributed to the progress of society, and new orders are taking place.

Changing conditions make it impossible for the farmer to remain isolated and self sufficient. The farmer needs what the other half of society is producing, and the other half of society needs what the farmer produces. These changed conditions put new demands upon the farmer citizen. He is responsible for the school and the church—two institutions that must go hand in hand to insure the rightly balanced intellectual and moral life of the rising generation. He must provide time and equipment for a wholesome social life in the community; play days for young and old, and good, clean amusement safely guarded from low thought and vicious influences. He must give thought, time, and means to the boys' and girls' club work which is developing our children not only as good producers but teaching them the art of living with others; to work together and to play together. He must be a part of the co-operative movements for more intelligent farming and more systematic orderly marketing.

Even today there are too many farmers whose horizon is described by their own line fences. At best they can see only their own school district and immediate neighborhood. The farmer's horizon must be enlarged. His community vision must include the nearby town and city, as well as his own neighborhood. There is danger of the selfish spirit permeating our farm organizations, with the tenet, "Look out for the farmer, no matter what becomes of the city man."

Not long ago I was in a meeting of farmers who were planning for co-operative buying. I asked what would become of the merchants in the village. The president answered "That is not our affair. They can look out for themselves." It is our affair. What if the farmer could return to the homespun days of self sufficiency and starve out the rest of the world? It would turn back the progress of the world two centuries and we would have to again come up to this milestone. Worse than that it would be suicide to the farmer himself. We must be careful in our plans for bettering the farmer that they are constructive and for the good of all society, and not just selfish "for me and mine." The sooner both rural and urban people come to the realization that whatever affects one affects the other, the better it will be for all.

We hear much about the conditions in Europe and the effect upon the American farmer. This is an indication that our vision as farmers must still enlarge. We are world citizens.

A CONCRETE EXAMPLE OF WHAT GOOD MILK WILL PRODUCE

Are we farmers of this generation measuring up to our new responsibility induced upon us by the changing world conditions? It is a common saying that farmers cannot co-operate. Most of our failures in co-operative work have been caused by lack of efficient management and failure to pull together. We are improving in meeting these larger responsibilities. There are examples of splendid co-operatives that are working a double blessing: viz., bettering the farmer's condition and also giving a better service to society.

However great our responsibilities today, they will increase with the years. The farmer of the future must sit in council with statesmen, captains of industry, and leaders in commerce, not to fight for the farmer's rights but to help plan and direct and coordinate agriculture with all other industry that the whole of society may prosper and progress.

What training should we give our children to fit them for this larger responsibility? They must be good tillers of the soil; they must learn to work; and they must have a scientific technical education to do this satisfactorily. They must have a cultural education as well: philosophy, art, history, and literature are as essential to the farmer as are seeds and feeds and breeds.

I would encourage the youth on the farm to get the highest education ob-

MR. DOUGAN SPEAKING TO BANKERS, FARMERS, AND COUNTY AGENTS FROM THE DRIVEWAY TO HIS BARN

ainable, and then put it to the serv-
e of man through the field of agri-
ulture. Hanging over my desk at
ome is a verse by Foss that embodies
he thoughts of this talk:

Let me live in a house by the side of the road
Where the race of men go by;
he men who are good and the men who are
bad,
As good and bad as I.
would not sit in the scorner's seat
Or hurl the cynic's ban:
et me live in a house by the side of the road
And be a friend to man."

Soil Management in Missouri

The Missouri Station reports re-
ults from different soil treatments,
he figures representing decreases or
ncreases in net crop value credited
the extra expenditure and effects
f these treatments.

The accompanying table shows the
ffect of soil treatments when used in
four-year rotation. These results,
epresenting averages from all soils
hrough 18 years, emphasize the
reat significance of these soil treat-
ents in soil improvement in Mis-
uri:

il treatment	Total net return per rotation	Percentage increase on investment
gume (cowpeas or soybeans in corn)	$—0.47	—59
me (2 tons at start—1 ton every 6th year)	2.74	68
anure (8 tons before corn)	7.48	93
ne meal (150 lbs. with corn and wheat)	9.79	187
id phosphate (175 lbs. of 16% with corn and wheat)	8.36	191
ck phosphate (1,000 lbs. with corn)	—1.79	—29
tash (25 lbs. muriate with corn and wheat)	1.56	126

It will be noted that the seeding of
wpeas or soy beans in corn and the
e of 1,000 lbs. of rock phosphate
ith corn failed to make a profit over
e cost of these. The highest per-
ntage increase was with acid phos-
ate applied to corn and wheat and
xt to this was bone meal applied to
ese crops.

Bottling Restaurant Milk

HOARD'S DAIRYMAN:—The city of
racuse, N. Y., recently passed an
dinance forbidding the sale of any
t bottled milk in restaurants. Pre-
ous to that time the thousands of
rkers who lunched down town
uld get a glass of milk for five
nts. Now nearly all the restaurants
the city are asking ten cents for a
lf pint bottle.

The restaurant managers pay three
d a half cents for a half pint, or
cents a quart. At ten cents a half
nt they are making 187 per cent,
getting 40 cents for a quart of
lk that cost 14 cents! The result
rks injury in two ways. Consum-
s are using much less milk—an in-
ry to them from two standpoints,
e health standpoint and the finan-
al aspect of the question; and the
mand for milk has been cut no-
eably, a fact which reacts on the
oducers.

When Dr. Herman G. Wieskotten,
alth commissioner, was asked if
considered the gain in health
ndards from the use of bottled
lk only to offset the decreased con-
mption due to the change in price,
refused to discuss the matter ex-
pt to say that the Syracuse De-
rtment of Health is not a price fix-
g agency.

Commissioner Weiskotten has
ch to support him in his stand.
racuse is a leader in many health
tters, yet has not been among the
st to make a ruling of this nature.
man nature is such that the ruling
almost a necessity if this easily
ntaminated food is to be handled
fely, and if consumers are to get a
iform product. Under the careless
dipping of milk by the average restaurant worker the bottom of the can was bound to be of poorer quality than the top when milk was purchased by the can and dipped from the can.

Whether interested in the retail price question or not, this health department has established some facts regarding the effect the modern trend towards requiring the bottling of milk to be sold for beverage purposes—by means of a questionnaire it has sent to health departments of other cities of the country and state. This questionnaire contains two questions, the first, "Has the enforcement of this ordinance, (requiring bottled milk to be sold in restaurants) caused an increase in the price of milk?"; the second, "For what price is milk sold in your city?"

Answers returned so far disclosed that in most cases the enforcement of such an ordinance has not increased prices. Dr. Weiskotten has learned that all restaurant milk served in California must be bottled, and that many other cities of the United States have similar ordinances. Surveys before California adopted the ruling showed great variations in butterfat and bacteria content.

In Syracuse two tendencies are now manifest to sell only Guernsey milk, which commanded the higher price before the ruling; and to sell milk from sanitary, approved urns which contain stirring devices. It will be up to producers and consumers in Syracuse to deal with this move to charge too high a price.

New York. M. G. FEINT.

The Sins of Price

PRICE cutting sins against quality. Price cutting sacrifices serviceability — because low prices are often made by "skimping," by adulteration and substitution.

The United States Pure Food Law made the sins of price a crime. But this law protects you only on the things you eat.

In many other lines, the "manipulation" of merchandise to make price "baits" is not illegal—

For example, cutlery may be stamped and not hand forged. Aluminum ware may be made of light weight metal. Enamel ware may have two coats instead of the standard three. A price a few cents lower is always a tempting price.

In clothing, a cheaper lining saves 25 cents per coat; a cheaper sleeve lining alone saves 15 cents; composition buttons save 5 cents; cheaper pocket material 5 cents; a belt *not* interlined saves 5 cents.

A "skimped" pattern saves material. A leather lined coat can be made two inches shorter, with wide cloth facings—saving 50 cents per coat.

These are the sins of price.

For Fifty-five years, Montgomery Ward & Co. has sold only reliable, standard goods. Quality first — then low price —but we never sacrifice quality to make a seemingly low price.

A Price too low—makes the Cost too great.

An example of Ward Quality

This shoe has a second sole as good as the outer sole. Similar appearing shoes are sold at 25 cents less—by making the second sole of leather costing 20 cents instead of 45 cents. Such shoes are worn out when the first sole wears through. The saving in cash is 25 cents—the loss in serviceability at least $2.00.

Neighborly Notes

Early this morning the telephone rang and when mother answered, a dear friend of the family said from the other end of the connection, "Oh, Esther, this is Emily Lavendar. Can't you all come over and spend the day? I attended the most original party yesterday and I simply must tell someone about it. So do come over for dinner."

After that how we flew at our morning meal, getting the children off to school with a warm breakfast inside of them, and good warm coats, caps, mittens, and galoshes all buttoned snugly on the outside. Next, mother hurried through the breakfast dishes and the milk pans and pails, made the beds in record time and straightened up the house. Meanwhile the men folk were doing up their chores and feeding up the stock. Coming in before mother had finished sweeping the floor they called to know whether or not they could wear their flannel shirts, for they simply would not go if they had to put on white ones, and also was there any hot water to shave with. Mother had to hurry for she had the little tots to wash and dress as well as herself, and the men had only themselves to do for.

But before the babies had their coats on, the car was running relentlessly at the door. Every once in a while father blew the horn to hurry mother a little. Oh, how hard it was to remember everything at the last moment with the men sitting in the car, waiting, and it running. At last the door was locked and the key placed where the school children could find it when they got home first and father actually could start the car. "Been running half an hour," he assured them. Mother sat back and drew a long breath of relief and tried to relax her taut nerves, and to get into a little less flustered state of mind ere she arrived, when suddenly she realized that she had forgotten that plant she had been raising for Emily Lavendar for a whole year. But the men refused to turn back and she had to bear her disappointment. It was such a shame for just now the plant was so pretty, too,—one of those new pink begonias all blossomed out. It was a beautiful day and the sun shone brightly on the snow, though the men predicted more snow before night. Gradually, as they rode along, a feeling of contentment and restfulness stole over mother replacing that nervous tension of the past hour.

The Lavendars were watching for us eagerly and, oh, what a lot there was to talk over. The men soon drifted to the barn to look over the stock and inspect the new team of horses. They passed their opinions upon laying mashes and dairy feeds, and compared the eggs they were getting and how their cows were milking. By dinner time they were back in the house ready to turn on the radio and listen to the latest market reports, although the women folk had wanted to hear a special organ concert at noon. Then the men must talk over the hog market and the price of butterfat. In the afternoon they walked across the fields to visit with another neighbor.

Mrs. Lavendar had been preparing such a delicious dinner, consisting of a tender roast, for they had butchered lately, and mashed potatoes, brown gravy, jelly, her famous cucumber pickles, baked beans, creamed carrots and peas, cookies, apple pie, cheese, and coffee. Now everyone ate and before we were through the babies began to nod their little heads and slump over sideways in their high chairs, and little Emmy started her little crooning which was always a preliminary to her nap. The babies were tucked in bed and the table cleared off by the time the men went out. Then the women could really visit.

"Now, tell me about the party, I am so anxious to hear all the details," mother begged.

"Well, yesterday I was invited to a party given by the Mothers' Club of the Wheeler District. They wanted to raise money and so each member invited four ladies outside of the district to come and each was to pay a quarter. But the entertainment was so unique it was well worth it," Emily Lavendar began willingly enough. "They gave a radio party. Now that everyone is so enthusiastic about radios it surely is quite an idea. And I thought perhaps if I told you about it you could use it for your club some time. Of course it was held in a schoolroom but a home could be used. The front part of the room was cleared and separated from the rest of the room by thin curtains of cheesecloth. On a table in front of us stood a loud speaker, probably a horn from someone's old phonograph. In the room of gauze a lady sat at a table with a disc in front of her that she used for a microphone. She was the announcer, and in a few minutes we heard a terrible grating and squealing sound made by someone behind the scenes, and then the lady said, 'Good afternoon, ladies. This is station JOY broadcasting our special Tuesday afternoon program for the mothers' clubs throughout the country. This afternoon we have some very special talent and feel that you will be well repaid for switching your dials onto JOY for the entire broadcasting period. The first number this afternoon is Madame Schumann-Heink Hanson who will sing for us that old favorite, Annie Laurie.' And then Myrtle Hanson appeared upon this radio stage and sang for us.

"Number after number was carried out this way. In each case the announcer had a few very apt remarks to make. We listened to Alma Gluck, and the trio with ukes from Hawaii, and even Topsy and Eva Duncan. That proved to be very good, for Bessie Ridge was dressed up to represent Topsy Duncan and had her face blacked and all of the worst combinations of colors on imaginable, and such loads of jewelry. And every once in a while the static was so bad we could not hear a thing. Of course, all of the program took place in this gauze room, but we could see it as well as hear it. But the best number of all was the men's quartet; they sang a group of old southern songs. One could work up any sort of a program and give it as a radio party and it would be new. We surely enjoyed it."

Mother replied, "Oh, I am so glad to hear about that. I have been trying to think of something rather original and different to give at our next party of the study club. And this solves the problem. You know we have been studying American composers and their music and we could work that into such an idea just splendidly. Why even the papers we wanted to have read could be read over the radio. Bless your heart, Emily, you have surely solved a problem for me."—ETHEL MORRISON—MARSDEN.

Pets

The more I see of children and their pets, the more I marvel at their parents. Many and many a mother who is considered an admirable woman in nearly every respect will yet stand by and see a helpless cat pulled around by the tail, a chicken squeezed until it later dies, a d whacked with a big stick, and all them improperly fed when fed at and will do no more than say, "O Johnnie, dear!"

I realize that it is very hard bring up pets and treat them prop ly but if they cannot be treated well as all our animal friends we meant to be treated, it is bet never to have them at all or to m cifully chloroform them. For so reason parents usually say, when boy gets to a certain age, "Well, n that Jimmie is—he really ought have a dog," so they get a helpl pup for him and their responsibil seems to be at an end.

If only pets were properly f they would be better able to sta the injustices of life but they rar are, mostly because they are unco plaining. The old dog will look hu grily in at the door and whine a lit from time to time but after abo so long he sees the food put aw realizes that he is to wait until so one gets ready to think of him, a goes patiently away and lies dow

(Continued on next page)

Design No. 2998—Desirable street dress with slenderizing lines created by front panel, com pleted with deep rever collar, which extends to waistline. The open V-neckline is extreme youthful. Silk crepe in two-tone effect, georgette, or wool rep is chic. Pattern No. 2998 ca be had in sizes 18 years, 36, 38, 40, 42, 44, 46, and 48 inches bust measure. The 36-inch si requires 3¼ yards of 40-inch with ⅞ yard of 18-inch contrasting material. Price 10c in stam or coin (coin preferred). Our patterns are made by the leading Fashion Designers of Ne York City and are guaranteed to fit perfectly. Send to Fashion Department, Hoard's Dairy man, Fort Atkinson, Wis.

No. 2769—Slip. Cuts in sizes 16 years, 36, 38, 40, 42, 44 and 46 inches bust measure. The 36-inch size requires 2⅞ yards of 36-inch material.

No. 2767—Pantalets. Cuts in sizes 16 years, 28, 32 and 36 inches waist measure. The 28-inch waist measure, requires 2¼ yards of 40-inch material.

What a devoted dog will stand from human beings is always to me a marvel.

I guess I always get pretty much "riled" when I get on the subject of dogs and horses, so while I cool off let's see what the dog really requires in the way of food. Overfeeding him is a very bad thing and even the active dog will thrive best on two feedings a day. If he is a small house dog, he is better off with one; these feedings, however, should be given intelligently and should be ample in size. In the morning all he needs is "dog bread" or table scraps but in the late afternoon he should have a regular meal—a ration made up especially for him and consisting of rice or hominy or corn meal cooked with about an equal part of lean chopped meat to which has been added salt and enough water to make it of porridge-like consistency. For the best health of the dog, some green vegetable should be added to this and, especially if he is a little out of condition, some bran. He should be allowed to eat all he wants of this in the evening. If to this you add an always available dish of clean water and a good place to sleep, and play but not cruelty from the children, you need not reproach yourself when you hear the passage read out of the Bible about doing it unto "one of the least of these." I have always thought that verse should be interpreted to include every bit of the animal kingdom that is given to our charge.—LUCY THOMPSON.

Is Debbie Right?

"Debbie Duncan was talking about those poor English women who cannot get married because there are about a million more women than men in England, and she says it's a great pity because those women will never know how well off they are."

Now, with all their shortcomings it would be pretty hard to get along without the men but, on the other hand, there is more truth in Debbie's remarks than some people believe.

It was a young woman of 32 who set me thinking the other day about old maids, unmarried women, spinsters, or whatever they like, bless their hearts. Now most girls would prefer being married but they are not all as honest as this friend of mine who frankly admits that single blessedness does not appeal to her in the least. The trouble with her is that she is much more mentally gifted than the average person and she has had an unusually fine education. She tries to conceal both facts for, according to her views on the subject (and I don't doubt she is right) men are afraid of her when they find her out as she is; they want to be the head of their houses and they are afraid they won't be able to if they get wives who are too smart. Instead of making the most of her gifts and taking a chance on marriage, this young woman hides her light under a bushel because, as she says, "She would rather be dead than go through life unmarried."

To me, there is something dreadful in that way of looking at it. We are so constituted as never to be satisfied; always we are wanting something more and that is as it should be, for life will be pretty dull when we get

(Continued on next page)

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Our patterns are made especially for us by the leading fashion designers of New York City. No stock of patterns is carried in our office and, since all orders are forwarded to the factory, kindly allow a reasonable time for delivery of any pattern you order.

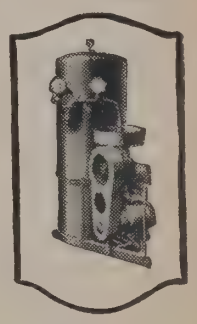
cistern *water for* washing

Fresh! well water to drink with one system

THINK of having running water — all you want, all the time—*both soft and hard!*

Soft water at the turn of a faucet, pumped from cistern, lake or stream—for washing clothes, scrubbing, sprinkling the lawn and garden. *Drinking water,* cool and sparkling, *pumped direct from the well.* Not just to one, but to *several* faucets anywhere around the premises! That's convenience for you!

The National stores the power—*not the water.* Air only is in the tank and serves each pump at the various sources of water supply. Strong faucet pressures are obtained against lifts up to 150 feet with pumping capacities ranging from 200 to 2,000 gallons per hour.



Install Anywhere—Nothing to Freeze

No water storage tank to freeze; no standing water to turn stale in Summer. Water is pumped only as it is used! Put the National in unheated garage, barn, granary, milk house or basement—it may be 10 feet or 10 miles from the source of supply.

New Power Unit

Patented, sleeve-valve air compressor—the result of several year's research and testing—makes possible continuous operation, hour after hour. Banishes the troublesome check valve and air leakage; makes unloading valve for starting unnecessary. Assures quiet operation with less power consumption. A triumph as great as the "O. K." National Pump.

This shows the new National Power Unit, electric type. Also supplied for gas engine power. Air stored in tank operates one or more "O. K." National Pumps which fit 4, 5 or 6-inch casings and are also built for shallow submergence.

Free 32-page book, "Fresh Water." A real guide to anyone planning a water system for farm, suburban home or public building. Write for it today.

Better Light for Home and Farm

—A Coleman Quick-Lite will give you the abundance of clear, steady brilliance that more than two million families are enjoying. You can have ***better*** light and ***plenty*** of it for any purpose—indoors or out—anytime you want it—all at less cost and without bother or work.

Coleman Quick-Lites are brighter than 20 old-style oil lamps or lanterns. No wicks to trim; no chimneys to wash; no daily filling. Make and burn own gas from common motor gasoline. Light with matches. Safe—can't spill fuel; can't be filled while lighted. Economical—more than 40 hours brilliant service per gallon of fuel. Lamp is beautifully designed, an ornament in any home. Lantern is sturdily built to stand long and hard service.

Dealers everywhere sell Coleman Lamps and Lanterns. If you dealer cannot supply you, write our nearest office and we will see that your wants are supplied promptly. Address Dept. HD22.

satisfied. But we must admit that there will be something we cannot have; some will miss having as much money as they would like, some will miss health, some will miss having children—the list is infinite—and some will miss marriage. Each will think that the thing he has missed is the one big thing worth having, yet there will always be found a host of the world's fine people in any of these classes. So with the unmarried women, I hardly see how the world could have run without them for they have done some of its most important work.

The "old maid" of former days is gone forever. The girl who does not marry no longer goes to her brother's house after her parents are gone and sits in the chimney corner waiting for "the end." She would rather be married, of course; but not to just anybody; no, indeed. She is pretty independent about that and she puts on her best hat and goes out and looks around her and picks out the thing she can do best and does it. It may be nursing, or housework, or running a food or candy shop, or sewing, or selling insurance, or raising chickens, or growing fruit—there's scarcely a line of work today that does not employ some women.

Is she happy? Of course she is for she is taking her part in the world's work. A friend of ours, age 46, called a few days ago. She drove up in an expensive car, came in, took off a handsome coat and hat and decided to stay for supper. We knew that Mr. A., an interesting bachelor, had been paying her a good deal of attention. "Why not marry him?" we asked her.

"Well," she replied, seriously, "I've thought it over a good deal and I look at it this way: I've got a good job making nearly as much as he is; I have a nice home, my car, and my friends. I know where I am, but if I married I don't know where I'd be. No, I think I'll just leave him for someone else."

That is the way one so-called "old maid" answers Debbie Duncan.—LUCY THOMPSON.

A Bit of Primping Now and Then

We have heard all our lives how much more lovely we could all be to look at if we would only take a little care of ourselves. Some of us feel that we have not much to start on and that there is no use in trying to make anything of what there is, but of course we all know the answer to that, too; the less we have in the way of natural good looks, the more imperative it is that we fix up that little the best possible.

I was interested the other day in reading of what is being done by one of our great women's organizations for the immigrant wives who come to this country to meet their husbands. Many of these men have been here earning money to send back for their families to get to America on and while here they have become so used to the American women that they have somewhat forgotten the peasant ways and looks of their own women. American women have more freedom than those of any other country and they also have more leeway in the matter of dress and personal appearance. What wonder, then, that the husband after being away from them for several years is somewhat surprised and disappointed at the way his family looks.

The organization of which I spoke makes it a business to go out to Ellis Island when the big ships come in and explain to the foreign wives the ways of American women and how they dress. Some of them will have nothing to do with any change and continue to wear their head shawls and their eight or more petticoats but most of them are delighted at the chance to change and often dance before the mirror when they see the grand appearance they make in their American clothes. A little powder is patted on, the hair is rearranged, and presto! the waiting husband's anxious look breaks into a grin of delight to see the fine "American" wife he has got.—LUCY THOMPSON.

Hand Lotion

We have found a remedy for rough hands that we think worth while. We keep a small bottle of sour milk on the draining board and when we wash our hands before they are dry put on a little. The acid immediately counteracts the alkali in the soap and then can either be rinsed or wiped off. It is as good for your face as it is for your hands. I have not needed any other remedy this winter. It will leave your hair soft and glossy, too, if rinsed well.

Ohio. (MRS.) J. F. MARTT.

Take any size bottle, fill one-third glycerine, one-third bay rum, and one-third rose water; mix well. Apply every night on going to bed. Rub in thoroughly.

So. Carolina. H. A. WARD.

Here is a hand lotion we think mighty fine and have used for face as well as hands. Put in clean jars or bottles, makes lovely gifts and inexpensive, too: Two ounces glycerine, 1 dram of oil citronella, 2 drams tragacanth, 1½ pints soft water. Put tragacanth and water together for 2 days, then add other ingredients. A few drops of perfume may be added but the lotion has a very nice odor of its own.

Wisconsin. (MRS.) ALVA HOWARD.

Take equal parts of lemon juice, glycerine, and alcohol. Roll and squeeze the lemon (one lemon makes a good deal). Take the quantity to the druggist and ask him to put into the bottle one-third as much glycerine and one-third as much alcohol as there is lemon. Use it plentiful at night, wearing gloves to protect the bed clothes. It will heal and soften the hands in a short time.

Wisconsin. A. F. CHAFFEE.

One ounce flaxseed steeped in 3 gills water; strain and mix with the following ingredients: 1 oz. glycerine, 1½ oz. alcohol, 15 drops pure carbolic acid, 15 drops benzoine, and a little violet water.

(MRS.) W. W. WAKINS.

Household Necessity

Butcher: You want some brains, madam?

Housewife: Yes, please. My husband hasn't had any for a long time. —The Progressive Grocer.

Teach Her to Sew

On page 38 of our Spring and Summer Fashion Magazine, there is a picture-lesson showing how the girl can make this dress for herself.

Let your little girl see this. She'll want to make the dress. Give her the lesson in the book and let her try it. She'll be taking the first step in an art she should learn.

Send 10 cents for the book to Fashion Dept., Hoard's Dairyman, Ft. Atkinson, Wisconsin.

YOUR BUILDINGS

the ASSETS everybody sees

THE appearance of farm buildings is the visible standard by which a farmer's customers and neighbors judge his good management. Your buildings, painted white or light colors with Eagle Pure White Lead in Oil, indicate careful attention to economy. They provide cheerful surroundings that add to the health and happiness of everyone on the farm.

Farmers who have painted with Eagle know its economy in first cost. When repainting time comes, they realize another economy of pure lead paint. It wears away evenly, slowly. It is tough and elastic—does not crack or peel off—leaves a perfect, deep-anchored foundation for repainting.

Leading paint dealers sell Eagle. *The Eagle-Picher Lead Company, 134 North LaSalle Street—Chicago.*

[You will appreciate the many helpful suggestions for mixing white lead paint contained in our "Tinting and Mixing Chart." Write today for your free copy.]

[EDITOR'S NOTE: This is the sixth and last of a series of articles on the dairy breeds in the United States.]

Well ventilated stables that provide pure, fresh air and that are comfortably warm in winter are equally as important to insure profitable milk production as are feed and water.—G. C. HUMPHREY.

"Is your mother in, sonny?" inquired the new minister as he stopped at the home of one of his members on his first round of pastoral calls.

"Betcha life," replied Willie. "Do you 'spose I'd be out here mowin' the lawn if she wasn't?"

$1.03 per year—that's all

That's the average upkeep cost of an E-B Spreader. Mind you, that is not an exceptional figure for one spreader. It's the average figure for 30,000 E-B Spreaders that have been in service for years. The E-B Spreader you buy will have the same long-lived construction as these 30,000 which have made a remarkable record for low upkeep.

Coupled with this economy of upkeep is ease of operation. The E-B Spreader spreads seven feet wide, consequently it travels only about half the distance other spreaders must travel to cover the same area. It turns a square corner, drives through a six foot door and the tight bottom saves the liquid manure. Its convenient height, 41 inches, makes loading easy. Mail the coupon for detailed specifications of this spreader and any other implement in the good old E-B line that has been saving money for farmers since 1852.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

A Farm Boy Follows Through

Part 1

EVER notice a good baseball pitcher? What happens after the ball leaves his hand? His arm, shoulder,—yes, and his whole body, follows through. That's what makes his pitching effective.

Babe Ruth slams the cover off the ball. When he swings at the old pill his bat doesn't stop after meeting

Herbert harvests his 1925 potato project, grading as he digs. The little potatoes go into the pail for the pigs; the marketable ones into the basket.

the horsehide. If it did, Babe Ruth would never be home-run king. His bat, shoulders, and whole body follow through in a mighty drive.

Many a basketball game has been won by following through on the shots, taking another one off the bounding board before the opponents have a chance to get the ball. "Follow, follow, follow," is the cry of the hardwood court.

A football player could get neither distance nor height on his kicks if he did not follow through after his foot meets the leather. Just as the follow through is essential for success in the world of games, so is it essential for success in the game of life.

Herbert Wisch is a farm boy who follows through. His is an all around development brought about by work and ambition. Follow through! High school, then college. Now he is a Freshman at the Wisconsin College of Agriculture.

A problem is a challenge to Herbert. No matter whether it's algebra or a balanced ration for his father's herd, he is not content until the problem is solved. It may take him fifteen minutes, it may take hours; or in the case of a farm project it may take months; time doesn't matter so much. Results are what count.

All around development—that's it. Here are the counts on his score:

Number 1—Born and raised on a farm two miles north of Ft. Atkinson., Wis., Herbert walked to high school every day during his four-year course. In 1924 at the age of seventeen, he joined the Hoard's Dairyman Juniors.

Number 2—Athletics. Noon hours he played baseball, his favorite sport, and was known as a "real ball player" among the fellows. Incidentally he keeps informed on big league stuff and can discuss leading batters, fielders, and teams for hours. Now he is a candidate for the Freshman baseball team at the Uinversity.

Number 3—Music. All through high school he studied the violin and was a member of the high school orchestra. Now he finds that his music gives him both pleasure and profit and can help him earn his way through college.

Herbert Wisch helped the Fort Atkinson high school team win first in swine judging and third in judging all live stock competing with 67 teams in the 1925 state contest at Madison, Wisconsin. Herbert was third high individual in swine judging among 204 contestants. Left to right—H. A. Hovde, teacher and coach; Herbert Wisch, Earl Hartel; front—Howard Purdy.

Number 4—Debating. In his Sophomore year he earned a place on the high school debating team. For three years teams of which he was a valuable member were leading contenders for the state championship. In his junior year the teams *did* win the state interscholastic championship, and in his last year the teams were in the state finals. Maybe you think that doesn't mean WORK.

Number 5—Scholastic. For his entire four years in high school Herbert maintained an average grade of 90.16 in all his studies. WORK did it! Now he is striving for scholastic honors in college.

Number 6—Agriculture. Herb Wisch started with a pure-bred Guernsey calf in 1923. She has had three calves. He also started a potato project that year which he has carried through four seasons, and he plans to raise potatoes this year as a means of earning some more money for his college education. A pig project was conducted for two years. In 1925 Herb also grew an acre of corn. In 1926 his principal project was the management of his father's dairy herd.

When Herbert went to college last fall he had $350 in the bank, profits from his projects. Every cent of that he earned. He paid for his calf by giving his father one of her calves. He paid for his sow and her keep with part of her litters. He bought his own seed and paid for the use of the land, horse, farm machinery, fertilizer, etc.

Herb Wisch was a member of the Fort Atkinson High School Live Stock Judging Team that went to the state contest at Madison in the fall of 1925 and placed first in judging hogs competing with 67 high schools from all parts of the Badger State. The team placed third in the judging of all live stock. Herbert Wisch was

In 1925 Herbert joined the Wisconsin Grain Growers' Association and planted an acre of Golden Glow corn. Here he is, looking up to his project.

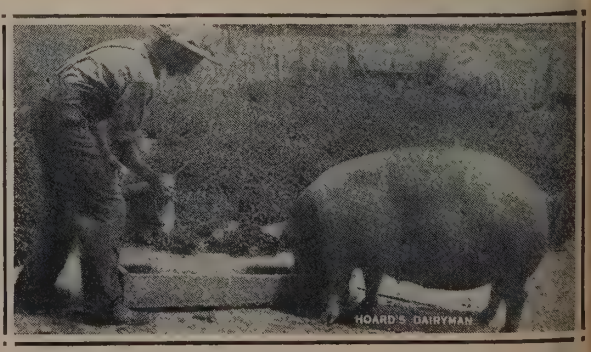
third high individual in the judging of swine.

The same year Herbert took part in a state wide seed and crop indentification contest and was one of nine boys to score 100 in forage identification.

In 1924 he exhibited five spring pigs, Hampshires, at the Jefferson County Fair. He won first on get of sire; second and third on boars and sows in the open class; in the club class first, second, and third on sows and first and second on boars. The prize money amounted to $28. In 1925 he fitted and showed two Guernseys from his father's herd and two calves from his uncle's herd, winning second on the senior yearling bull in a class of eight, first on the senior yearling heifer, first and second on the calves. He split the prize money with the owners of these cattle, winning a total of about $33.

Herbert did his project work under the supervision of his agricultural teachers at the Fort Atkinson High School, both Smith—Hughes instructors. H. S. Bingham was his teacher the first two years. H. A. Hovde succeeded Mr. Bingham and was Herbert's teacher through three project seasons.

Guernsey Calf Project—In the



In 1923 Herbert demonstrated in his first school project that certified potato seed outyields home grown stock. A row of home grown seed produced only 145 lbs. as compared to 230 lbs. from a row the same length of certified.

In June, 1923, Herbert joined the newly organized Guernseyway Calf Club and was elected its first president. This picture was taken at that meeting. Herbert is on the extreme right. J. C. Ralston, leader, stands behind at the left.

The pure-bred heifer with which he joined the club grew well. Her first calf, a heifer, went to his father to pay for its mother. This picture shows Herbert with his club heifer, and her second calf.

Herbert feeding his Hampshire sow. "Before she farrowed," he says, "I fed her a slop made of bran, ground oats, and middlings. She got about 24 lbs. of skimmilk a day. This ration was cut down just before farrowing."

mmer of 1923 Herbert Wisch ined the newly organized Guern- yway Calf Club and was elected its st president. The pure-bred heifer hich he selected from his father's rd grew well. Her first calf was a ifer. This Herbert gave to his ther to pay for its mother. He also ve his father the milk from the ifer to pay for her keep.

The second calf by his club heifer as a bull. Herbert grew this fellow t well in nine months and then sold m for $70. The heifer freshened ain this fall while Herbert was ay at school. Herbert hopes to ll his cow so that he can add to his llege fund.

"My dairy calf was born on September 13," says Herbert. "When I

For three years Herbert Wisch was a high school debater. The Fort Atkinson debate teams shown here were Wisconsin state champions in 1924—25. Seated, left to right—Herbert F. Wisch, George Sherman, Coach F. C. Bray, John Eales; Kenneth Westby; standing—William Urban, Assistant Coach Oscar Bienfang, Ilo Gross.

rted with my calf I put her in a arate pen and supplied her with ter at all times. I put a pail right her pen. I petitioned off a corner the feed manger so I could tell w much feed she ate. I left her h her mother for about three eks to give her a good start. When weaned her I put her on skimmilk once. I started out with 4 lbs. of mmilk and kept gradually in- asing this amount until she was

Herbert Wisch was the first president of the high school agricultural club organized in 1924. This club managed the annual community fair. Can you find Herbert's smiling countenance in the front row?

ting about 16 or 18 lbs. a day. d her skimmilk until she was over e months of age.

My father always left the calves k for the first three weeks because essened the labor. I think it is ier to wean the calf right away, gh.

As soon as I weaned my calf I ted to feed her whole oats to- er with some bran. Later, when was about three months of age, I ed up a grain ration of equal s ground oats and bran with a ll portion of oil meal to condition She also got alfalfa hay and e silage."

otato Project—Some interesting lts were obtained in a compari- of the yields produced by certi- seed and home grown seed. In spring of 1923 Herbert pur- ed some certified Early Ohio seed k at $1.25 a bushel. This he ted in rows beside rows of com- mon home grown seed. All got the same care.

When he dug his potatoes at harvest time he found that a row of home grown seed produced only 145 lbs. of potatoes as compared to a yield of 230 lbs. from a row the same length of certified seed. From his 22 rows Herbert figured he was $46.50 ahead by planting high grade seed. On one acre this difference would amount to about $70 with early potatoes selling at $1.50 a bushel as they did that fall.

The method of potato culture followed by Herbert during the four years he had a potato project was somewhat as follows: For fertilizer, manure was applied to hay land, clover or alfalfa, at the rate of 12 loads to the acre. The seed was planted in furrows four to six inches deep and dragged at once.

"One of the main things in growing potatoes is to keep the weeds down by dragging before the plants come up," says Herbert. "I like to drag my potato patch two or three times before, then drag again just after the plants push through."

The first year Herb did not treat his seed potatoes before planting because they were certified. The third and fourth years he gave his seed the corrosive sublimate treatment to protect them from scab. Every season but one the potato plants were sprayed, using Bordeaux mixture for the leaf hoppers and arsenate of lead to get the "bugs."

Pig Projects—Herbert Wisch's first pig project was a spotted Poland-China sow which he obtained from his father. The sow had a litter of seven pigs, part of which reverted to Mr. Wisch in payment for the sow and her feed. Herbert later sold the sow for $30.00. The pig project that year netted $75.00.

The following spring, 1924, Herbert invested $24 in a pure-bred Hampshire sow purchased near Delavan, Wisconsin. She had two litters. Some of these were exhibited successfully at the Jefferson County Fair as already mentioned. Herbert finally sold the sow. He felt that the Hampshires didn't put on quite enough weight for market, but that

$16.15 cash, f.o.b. factory for 500-lb. scale. (Add freight to your town) 1000-lb scale $18.90

Losing?

A pound here, a pound there. Look out! Watch those little discrepancies. Often they are the difference between profit and loss.

But you don't KNOW unless you use a scale — a good, reliable scale that will tell you exact weight of everything you buy and sell.

Put this scale on your farm, as hundreds of farmers have done. It is a genuine, Fairbanks long-life scale. Has the latest improvements including Easy-Reading Poise and Arrow Tip Beam.

Have your dealer show you this scale. Quantity production permits the extremely low price.

Here's Your Camera!

Of course you want a Camera. Every normal young man or woman wants a picture of the friends, the occasions and the surroundings, the memory of which brings so much pleasure in after years. Club members want a picture of their calf and other pictures showing its development.

Here's a chance for you to get your Camera without digging into the savings bank or "asking dad" for help. We offer this Goodwin Camera No. 2, (Ansco made) in return for a little work you can easily do among your neighbors.

We will send this Camera, free of charge and postage paid, to any Junior who will send us three — ONLY THREE — subscriptions to Hoard's Dairyman at $1.00 each.

You can easily get three of your neighbors to give you $1.00 each for a three year subscription to the "Dairy Gospel." Get 'em—send 'em in—and the Camera is yours!

HOARD'S DAIRYMAN JUNIORS, Ft. Atkinson, Wis.

Circle A Cork Brick provide *every* quality necessary for safe, comfortable floors in your stalls. They are *warm*. They are *dry* and *nonabsorbent* of moisture. They are *resilient* and *easy underfoot*. They are *nonslippery*.

Furthermore, Circle A Cork Brick are easy to lay and durable in service. At very reasonable cost, they insure comfort for your herd and protect them from disease and accident—an investment in floors that safeguards your investment in cows.

Circle A Cork Brick Floors

For Dairy Barns and Hog Houses

they were fine for home killing. He recorded a gain of $60 on the pig project the last year.

"I got my Hampshire sow in February and she farrowed on April 9," Herbert relates. "Before she farrowed I fed her a slop made up of equal parts bran and ground oats with some middlings. I fed her all the skimmilk I could get which was about 24 lbs. a day. I cut the entire ration down some just before she farrowed.

"At eight weeks the little pigs were weaned. Soon after that I put the sow and her pigs on clover pasture, feeding also some ground oats, bran, and middlings about equal

"I got my Hampshire sow in February, 1924," says Herbert, "and she farrowed on April 9." Here you see Herbert proudly looking over his new sow and her little "belted beauties."

parts. As soon as the corn ripened that fall I started feeding them about an ear apiece. When I started to fatten them I gave a bushel and a half to two bushels a day to the six little pigs. I also fed them some slops."

Corn Project—In 1925 Herbert joined the Wisconsin Grain Growers' Association and received 10 lbs. of superior Golden Glow seed, enough to plant one acre.

Since his Freshman year in high school he has tested his father's see corn regularly with a "rag doll" ou fit belonging to the high school. Ju this last year Herb threw out sever ears that his father would have plan ed had it not been for the test. As result the corn did not have to planted over, while many of th neighbors who had not tested had replant. Herbert did not test th Golden Glow seed which he plante for his project. He picked some his corn for seed and the rest was fe to the hogs.

Next time we will tell you ho Herbert Wisch managed his father herd—weighing and testing the mil keeping records, and figuring bett rations to cut down the cost and kee up the milk flow.

Herbert introduced improved pra tices at home. His father had nev kept production records. He fed l guess and the ration was not ba anced. Now he weighs and recor every milking, and mixes his feed a cording to rations which Herbert h balanced.

Our Review Column

[A regular feature of the junior department, reviewing the contents of Hoard's Dairyman for the previous issue. Let's talk it over.]

The corn borer is coming. Read about its invasion on page 237 of the March 10th issue.

When and how did the corn borer come to America? These insects came from Europe about ten years ago with a shipment of broom corn. It was introduced in three different locations at the same time, Boston, Mass.; Schenectady, New York; and St. Thomas, Ontario.

How far has it progressed? The Boston area has spread into New England; the Schenectady area has increased but slightly. From the Ontario region the borer has spread east into Western New York, Western Pennsylvania, Northern Ohio, Eastern Michigan, and Eastern Indiana. In January the corn borer was discovered in Illinois.

How does the corn borer work? The European corn borer is a worm which bores into the stalks, ears, and tassels of corn. The adult moth starts laying eggs in June and can fly as far as 25 miles. The eggs hatch in four to six days. These worms are the borers. From October to May they hibernate in the cornstalk and this is the period in which the borer must be attacked if the spread is to be stopped.

How can this insect be controlled? 1. Do not buy seed corn on the cob. 2. Use latest machinery to cut corn low. 3. Put as much corn as possible in silo. 4. Shred the remainder. 5. Plow all stubble and stalks und before May 15. 6. Before May shell all corn remaining in cribs. Burn all fence rows and refuse b fore May 15. 8. Keep cornstalks o of manure which will not be plow under by May 15. 9. Educate yo neighbor.

How is Dougan taking the gamb out of his dairying? By diversifi farming in both live stock and crop by controlling his income and e penses—using the budget syste (See page 236.)

Does sweet clover make good pa ture for cows? Yes, answer farme in Manitowoc County, Wisconsi who are growing over 10,000 acr of sweet clover for cow pasture, u der the leadership of R. R. Smit their county agent. Joe Svacina, o of these farmers, says, "I would n farm without it." (See page 240

How do they plant their sweet cl ver? According to Smith they ha had very good success by seedi in the spring with oats, barley, canning peas as a nurse crop, pla ning to pasture lightly that fall a heavy the following year. The ra of seeding varies from 8 to 16 lbs. acre. Scarified white biennial se has proved best. From one-half two-thirds of an acre per cow is lowed for pasture.

What happened to the McNar Haugen bill? This proposed measu for farm relief was vetoed by Pre dent Coolidge because he consider the bill unsound in principle and i jurious rather than beneficial to a riculture.

easonable Live Stock Notes

he South, cows are already out spring pasture; in the middle tes, some cows are out and the s of others are anxiously ready en the gate—their supply of is nearly exhausted. In the , cows must be content with si- hay, and concentrates for an- month. The important thing in g cows to pasture is not to put on too soon. To do so reduces eld of grass. It may also re- he yield of milk unless one con- to supplement pasture with feeds until the grass gets a start.

Build Up the Weak Cows

k over the herd. At this time year we find many cows de- in weight and mineral reserve. ed mineral reserve cannot be ily observed as outward physi- ndition.

ial Treatment for Unthrifty Pigs

ention is always better than nt or cure. It is so with fall quently subject to the results winter rations. Where the rations have not been right alts speak plainly at this time . Pigs are uneven in size, un- rough coated; they may be re, or lame in their legs; they rtily but do not get on like farrowed pigs of the same age differently. We suggest that igs be separated from the ones; that they be given as irect sunlight as possible; that given alfalfa hay or meal; me skimmilk be fed in addi- grain; and, that they be sup- mineral mixture composed of arts by weight of salt, bone inely ground, high calcium e, and wood ashes. As soon green grass is available, get to it.

Grass Good Pig Pasture

ng pigs on to green grass re- s that one must first have the grass. One cannot have good pig pasture in the same way that one obtains gasoline from the filling station. Pig pasture must be ordered in advance of the time it is needed. If one did not attend to this last year he should try sudan grass for this year and at the same time he should seed some alfalfa for early spring pasture for next year. Try two or three acres of sudan grass this year. Prepare a good seed bed as for corn, broadcast 15 lbs. of seed per acre and harrow it in. In 6 weeks the pigs may be turned in. Sudan grass seed will not start well until the soil is warm. Seed it right after corn is planted or from then up until July first.

To Prevent Azoturia

About this time of year one hears of neighbor so-and-so having a horse go down with azoturia, or maybe it is a horse at home. The veterinarian gets on the job right away. The horse is paralyzed behind, unable to get up, in great agony, sweating profusely, unable to urinate and frequently becomes a dead victim in spite of professional veterinary skill. Prevention is less risky and more certain than cure. The disease attacks well-fed horses that have stood in the barn day after day without exercise when such horses are suddenly put to work. The disease also attacks well fed horses when put to work after short periods of idleness if they have been fed heavily of grain during the idle period. Idle periods, as short as from Saturday night till Monday morning, may be followed by an attack if the horses are full fed over Sunday. Horses affected frequently go down in the harness, hitched, away from the barn.

Daily exercise of well-fed horses is suggested to prevent this trouble, or if not this, owners are cautioned to put well-fed horses into the harness very gradually, giving light work to begin with. Cutting down the feed (grain) during periods of idleness is an important part of preventing the disease.

To Cure Scratches

March winds and the cold slush of the field and road frequently cause "scratches" on the heels, rear pasterns, and rear lower legs of horses. It is found more frequently on the rear legs than the front legs. If not given some attention the condition may become somewhat chronic and serious. Treatment consists in first cleaning the affected parts with warm water and castile soap, wiping them dry. Apply a lotion made of 2 ounces of lead acetate, 1½ ounces of sulphate of zinc, 1 ounce of carbolic acid, and one quart of water. Shake well before using. Apply daily until condition is under control.

Galled Shoulders

Heavy spring work brings with it sore shoulders for horses whose owners are careless about fitting collars properly. It is easier to prevent a sore shoulder than to cure one. The poorly fitted collar is the chief cause. In fitting collars one should see that the draft is evenly distributed over the whole surface; that the shoulder surface of the collar is kept clean. This surface should always be cleaned immediately when the collar is removed. When at work raise the collars at resting spells; keep the mane from under the collars. At night bathe the shoulders with cold water followed by a lotion made of 6 drachms of sulphate of zinc, 1 ounce of sugar of lead in 1 pint of water to toughen the skin.

Wonderful New Milking Method

Milks Cows Like No Other Machine Ever Milked Cows Before

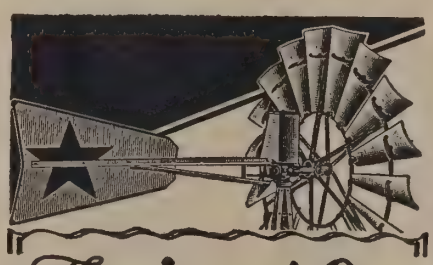
At last something really new in machine milking history! The wonderful new SURGE Milker!

A machine that is making records for Breeders who never dared use a machine before. A machine that produces low count, premium priced milk—and does it with no more work than you now give to washing milk pails. The Surge is sweeping everything before it!

Only These 4 Rubbers To Wash

Think of that! You men who have *tried* to keep old fashioned milkers clean—*mark this!* Only 4 simple pieces of rubber to wash. No long tubes. No claws. No places for the milk to lodge and breed bacteria. Easy to produce Grade "A" milk and get premium prices.

Which is easier to keep clean?



With The Surge Milker the milk travels ONLY 4 inches from Teat to Pail. With other milkers it travels through 4 feet of curling rubber tubes and twisted claws—where bacteria breeds and contaminate the milk. To produce CLEAN milk any milker must be thoroughly washed EVERY DAY. The Surge is so easy to clean that there is no temptation to slight the job.

Cream City GIANT- Milk Filtering Strainer Assures Clean Milk-*Quick!*

Two 14-quart pails can be poured into the Giant at one time

There is more profit in clean milk. Cream City Giant actually filters the milk, removing every particle of sediment. Pure milk keeps sweet longer.

Perforated strainer holds the filter disk so tightly against the strainer that not a drop of milk can escape without passing through the filter disk.

A giant in size, weight and strength—seamless—heavily retinned—indestructible—the most economical to buy as it will outlast a dozen light strainers.

Easy to Keep Clean and Sanitary

Two styles. The Cream City Giant for large production. The Cream City No. 1090 for the small farmer.

Cream City SANITARY MILK CANS

"The cans with the straight, strong breast."

Very Durable and Easy to Clean

The strong STRAIGHT breast makes it impossible to crush in the can at the point where the neck joins the breast.

DAIRY MARKET NEWS

February Butter

Butter prices in New York rose to 53 cents by the 19th of February and then dropped back to nearly the same prices as on the first of the month. The average for the month, however, was 51.5 cents, which is 2.4 cents above January, 6.6 cents above February a year ago, 11 cents above February, 1925, and 1.1 cents above February, 1924. The better markets are largely due to real shortages that have appeared in both receipts and storage. Withdrawals of butter from storage have been heavy, the March 1st holdings being the lowest on record for that date. Receipts at the four markets since January 1 are 4% less than for the same period a year ago.

For the first eleven days of March butter advanced from 50 to 52 cents, dropping back as this is written to 50 cents. While production, storage, and demand would indicate that the advanced price could be maintained, receipts of imported butter in fairly large amounts are largely responsible for the decrease. The market is sensitive at this time of year and even unconfirmed reports of purchases abroad that can breast the tariff wall are sufficient to cause buyers to be cautious. The latest quotations on foreign butter are 36 to 39 cents.

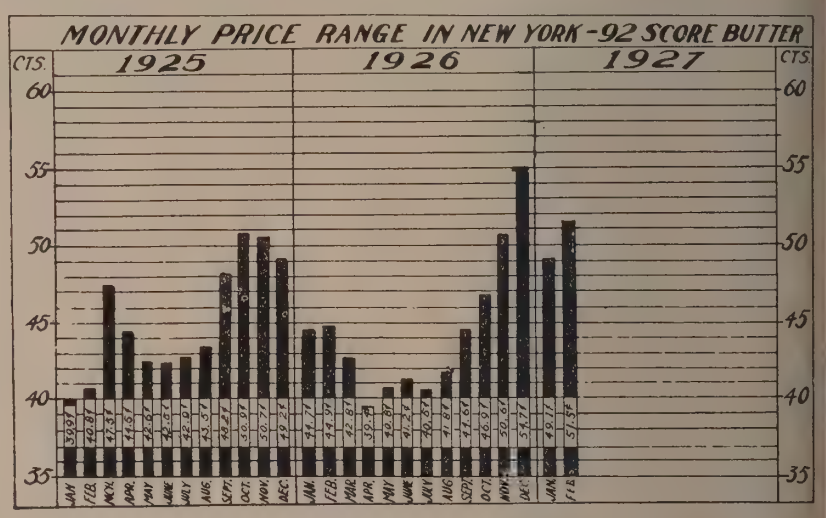
Creamery butter production for January was 94,346,000 pounds, a decrease of ninety thousand pounds from that of a year ago. Net imports were a million and a half pounds less, but because of a greater out-of-storage movement the trade output was nearly seven hundred thousand pounds greater than in January a year ago.

Daily quotations from the U. S. Department of Agriculture show the following average wholesale prices on 92-score butter (extras) at four of the principal markets, together with receipts and storages:

	Feb. 1927	Jan. 1927	Feb. 1926
	Cts.	Cts.	Cts.
Chicago	50.4	48.1	43.1
New York	51.5	49.1	44.9
Boston	51.9	49.5	45.4
Philadelphia	52.1	49.7	45.3
*Receipts for month	37,538	36,687	38,877
*Receipts since Jan. 1	74,225	36,687	79,503
*Storage (end of month)	4,222	10,208	14,018

*In thousands of pounds at the four markets (i. e.—000 omitted).

Ninety-score butter averaged 49 cents for February in Chicago, with centralized butter at this market selling for 49.9 cents. Jobbers' prices on extras sold to retailers averaged 53 cents in Chicago, a spread of 2.6 cents above wholesale.



February Foreign Butter

The following table of foreign butter prices gives the average of weekly quotations published by the U. S. Department of Agriculture:

Market	Feb. 1927	Jan. 1927	Feb 192
	Cts.	Cts.	Cts
New York	51.5	49.1	44.
Chicago	50.4	48.1	43.
Copenhagen	39.2	36.1	40.
Berlin	39.1	37.1	40.
London:			
Danish	41.4	38.9	42.
Dutch	42.9		44.
New Zealand	37.4	36.4	37.
Australian	35.9	36.8	36.
Argentine	34.1	34.4	33.

February Cheese

Cheese prices on the Wisconsin Boards averaged a decline of one cent from January but at 24.2 cents the month's average is st one cent in advance of prices a year ago. further decline of three-quarters of a ce

Owing to short supplies and good demand, February butter gained over January but failed by three cents to reach the December high average.

Cold Storage Holdings

(U. S. Department of Agriculture)

The following is a report of the cold storage holdings of dairy products on March 1, figures being given in thousands of pounds (000 omitted):

	Mar. 1 5-yr.-av.	Mar. 1 1926	Mar. 1 1927
	lbs.	lbs.	lbs.
Butter, creamery	19,288	26,313	8,086
Cheese, American	29,619	42,587	39,239
Cheese, Swiss	6,378	8,254	7,442
Cheese, Brick	1,229	1,605	1,547
Cheese, Limburger	774	1,192	1,467
Cheese, All other	4,736	4,537	4,230

These holdings include stocks in both cold storage warehouses and packing house plants.

Philadelphia Milk Prices

The Inter-State Milk Producers' Association announces that the March basic price for milk will be $3.29 f. o. b. Philadelphia and $2.71 per hundred at receiving stations in 51—60-m zone.

The February surplus prices were $2. first surplus and $2.20 second surplus f. o. Philadelphia. The February surplus prices all receiving stations on railroad were $2. first surplus and $1.62 second surplus.

These prices are based on milk testing 3 p cent butterfat with a differential of 2 cer for each half point of test up and down.

took place during March, the reported whol sale price on single Daisies being 22.25 cen on March 11.

Production of cheese for January was 21 496,000 lbs. as compared with 25,500,000 lb a year ago. Despite an increase of nearly million pounds in net imports and a slight larger storage withdrawal, the trade outpu was 2,441,000 lbs. less than in January a ye ago.

Daily quotations from the U. S. Departme of Agriculture show the following avera wholesale prices for American cheese on t Wisconsin Primary Market during February

	Feb. 1927	Jan. 1927	Feb 192
	cents	cents	cen
Twins	24.1	24.1	23.
Single Daisies	24.2	25.5	28.
Longhorns	24.8	26.5	23.
Square Prints	24.6	26.6	23.
*Receipts since Jan. 1	26,204	11,990	27,83
*Receipts for month	14,214	11,990	13,38
*Storage (end of month)	12,027	13,929	18,66

*In thousands of pounds at Chicago, Ne York, Boston, and Philadelphia (i. e.—0 omitted).

Milwaukee February Milk

The Milwaukee Co-operative Milk Produce announce the following prices for the mont of February:

For the portion sold as fluid milk, $2.90 p cwt.; and for the portion manufactured, $2. per cwt. These prices apply to 3.5 per ce milk delivered f. o. b. city, four cents bein added or subtracted for each one-tenth of o per cent variation in test. Sixty-eight per ce of the total receipts were sold as fluid.

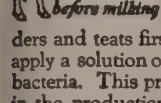
January Dry Milk

(From Report by U. S. Dept. of Agri.)

The wholesale prices given below are base on reports from manufacturers governing a tual sales F. O. B. factory during January.

Dry Skimmilk: Prices ranged from 7.5 cent to 12 cents for dry skimmilk in bulk, averag ing 9.5 cents a pound for sales, totalin

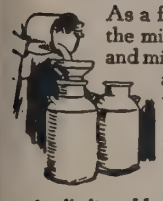
STERILAC



REG. U. S. PAT. OFF

An Ideal Disinfectant

Clean Barns



Dirt and manure teem with bacteria and mold. Remove the dirt and keep the floors, stalls, walls and ceiling clean. Apply STERILAC to all parts of the interior to destroy germs and to provide a suitable place to produce milk of low bacterial count.

Clean Cows

Wash the flanks, udders and teats first with water and then apply a solution of STERILAC to kill all bacteria. This practice is very important in the production of milk having a low bacterial count. It is a reliable procedure in the production of wholesome milk.

Clean Utensils

As a further precaution keep the milk cans, strainer, pails and milking machine and separator clean. Rinse these utensils with STERILAC solution before putting milk into them. After milking scrub thoroughly all utensils with alkali and hot water and then rinse with STERILAC solution.

Clean Milking Machines

In case the milking machine is used the metal parts should be thoroughly cleaned in alkali and hot water and then cleansed in a solution of STERILAC. The rubber tubing, rubber cups and other parts of the milking machine which are difficult to clean should soak in the STERILAC solution until ready to use. It is an easy way of keeping the machine clean.

Clean Bottling Machine and Bottles

STERILAC solution is ideal for use in bottling machines. After the bottling machine is cleaned with alkali and hot water let a solution of STERILAC run through outlets to destroy germs which may be present in the corners and other interior parts of the machine. STERILAC solution will also destroy germs inside bottles.

Sterilac for Dairy Factories

Dairymen, butter, cheese and ice cream makers will find STERILAC a most satisfactory disinfectant. It destroys the germs which produce off flavors and other forms of spoilage. Use STERILAC solution in milk vats, separators and anywhere in the factory where dairy products are produced. STERILAC destroys all kinds of bacteria which spoil milk and produce disease. STERILAC kills germs—*it does* not spoil milk which comes in contact with it. That is a very good reason why STERILAC is safe to use to produce milk that is safe to serve as human food.

Ideal to Handle

STERILAC comes in powder form—will keep its strength. Sunlight does not affect it. Special introductory offer of enough STERILAC to make 60 gallons of the strength used for ordinary sanitation $1.00. Complete directions enclosed.

Send a dollar bill today.
A trial will convince you.

The Sterilac Company
North Chicago, Illinois

4,589,672 lbs. When packed in one-pound cans the price reported was 32.5 cents a pound.

Dry Whole Milk: Prices ranged from 25.5 cents to 27.5 cents for dry whole milk, averaging 26.9 cents for sales totaling 372,077 lbs. When packed in one-pound cans the price reported was 47.1 cents a pound.

Dry Buttermilk: Prices ranged from 7 cents to 10.5 cents for dry buttermilk in bulk, averaging 9.1 cents a pound for sales totaling 1,420,937 lbs. When packed in one-pound cans the price reported was 10.8 cents a pound.

February Condensed Milk

(U. S. Department of Agriculture)

Information regarding prices paid producers during February is based on reports made by condensed and evaporated milk firms operating approximately 98% of the total factories in the United States:

Geographic section	No. of factories	Price per cwt. Range	Ave.
New England	1	$2.35	$2.35
Middle Atlantic	13	2.42—2.75	2.55
E. North Central	81	1.95—2.75	2.29
W. North Central	6	1.97—2.30	2.14
North Western	7	1.58—2.10	2.00
South Western	10	1.95—2.20	2.10
United States	118	1.58—2.75	2.28

Fifty-three additional factories reported prices to be based in part on the current month's wholesale butter quotation. Twenty-four factories reported prices not determined as yet and 20 reported plants closed.

Manufacturers' wholesale selling prices for sweetened condensed and unsweetened evaporated milk were as follows for January:

	Range	Ave.
Condensed, per case	$5.60— 6.55	$ 6.01
Condensed, per cwt.	9.28—13.00	10.44
Evaporated, per case	3.80— 5.05	4.34
Evaporated, per cwt.	7.50— 9.80	8.85
Condensed skim, per cwt.	5.00— 7.50	6.04
Evaporated skim, per cwt.	2.75— 4.50	3.53

The Feed Market Situation

(By the Grain, Hay, and Feed Market News Service, U. S. Department of Agriculture.)

March 11—Feed prices were not changed materially during the first two weeks of March. Some feeds were becoming more plentiful but demand continued of only moderate volume and buyers generally were apparently taking only sufficient feed for their immediate needs. Farm supplies of feed grains have been adequate for current needs in most areas and prices have been relatively lower than commercial feeds. Consumption has been fairly heavy, however, and according to the estimate of the United States Department of Agriculture stocks of feed grains on farms March 1, including corn, oats, and barley, were about 375,000,000 bushels less than at the corresponding time last year.

The production of wheat feeds appears to be increasing. During the first week in March flour production in the United States was 7 per cent above that of the previous week which would indicate a corresponding increase in the production of wheat feeds. Bran for April shipment is being offered by southwestern mills at about $1 per ton below spot quotations.

Light production of linseed meal at Minneapolis has caused an advance of $1—$1.50 in the price of that feed in the North Central States.

Cottonseed meal prices were reduced about 50c per ton in the southwestern markets during the second week in March. This reduction in price has been caused more by the limited demand than from any material increase in offerings.

The market for gluten and hominy feed is also practically unchanged.

The market continues dull for alfalfa meal and demand appears to be less active than a few weeks ago. In several markets, however, mixed feed manufacturers were buying alfalfa meal in larger quantities and quotations have remained practically unchanged.

Wholesale Prices of Feeds Per Ton in Car Lots, Bagged

	Boston	Buffalo	Philadelphia	Chicago	Minneapolis	Omaha
Bran*	35.75	31.50	35.00	29.25	27.25	
Bran‡			35.50			26.00
Bran†			36.50			
Middlings	36.75	32.50	36.50	31.50	28.75	
43% C. S. meal	43.50		42.50	39.50		38.10
34% L. S. meal	50.50	45.50		49.00	43.00	53.10
Gluten feed	39.90	36.65	38.75	32.75		
Hominy	34.50	32.00	34.50	29.50		28.50

*Standard spring bran; ‡hard wheat bran; †soft winter wheat bran.

Sheffield February Milk

The cash price for February paid Sheffield producers of New York for 3 per cent, Grade B milk in the 201—210-mile zone is $2.54 per hundred pounds with the usual freight and butterfat differentials. This is equivalent to $2.74 for 3.5 milk.—C. W. Halliday, Sec.

Wisconsin February Condensery Prices

Forty condenseries reported to the Wisconsin Department of Markets the prices paid in February per hundred pounds milk delivered at their factories. Reduced to a common 3.5 per cent test basis, these prices ranged from $2.19 to $2.30, the average being $2.28.

Eighteen factories sent delayed reports for January, the average being $2.31. This is 2 cents above the previously reported average of $2.29 for 46 factories.

Wisconsin January Butter

Wisconsin co-operative creameries paid producers a net price of 53.9 cents a pound for butterfat in January according to reports from 90 of these creameries to the Wisconsin Department of Markets. These creameries received an average of 47.6 cents a pound for butter, making a spread of 6.3 cents between the price received for butter and the price paid for fat.

The range of prices paid for fat was from 47.2 to 58.2 cents, with the price received for butter ranging from 46.7 to 49 cents. The overrun ranged from 22 to 24.3 per cent. Receipts of butterfat averaged 21,699 pounds per creamery.

Let Your Boy Save You Money

"I wish you could see my 13 year old boy do the milking", writes one Perfection user. "With my Perfection he does the work of two hand milkers."

Cash in on your boy's interest in fine machinery. It will easily save you the time of one or two men every morning and evening. Time is money. You can do more in the field.

Yet the boy will do more than save labor. He will do a better job of milking because the Perfection is never lazy. Its gentle suction, followed by a downward squeeze and a period of rest, is just like the natural action of the calf. Cows like it and give more milk.

Perfection does away with all the drudgery of hand milking, and the new sanitary two piece teat cup makes it quick and easy to clean. One pull and it's instantly apart for washing.

The Perfection Milker is the old reliable, backed by 14 years successful service. On farm or dairy it is a profitable investment, and you can depend upon a Perfection to give you long and satisfactory service.

Why milk by hand when Perfection saves needed and valuable time. Send today for free catalog.

The new 2 piece Teat Cup. One pull and it is all apart for quick and easy cleaning.

Perfection Mfg. Co. or **Perfection Milker Co., Inc.**
2100 East Hennepin Ave. Minneapolis, Minn.
240 West Jefferson Street Syracuse, New York

PERFECTION MILKER

OLMSTEAD Safe BOILERS

Sizes range from 3 to 30 H. P.

35 years record as the most economical steamer known. Do not fail to investigate the superior merits of this boiler, economical in fuel consumption, in attention and in space required. For steam or hot water for any purpose. Burns cobs, stalks, coal, or wood. Built to meet all the requirements of the different state boiler laws. Automatic damper regulator, etc. Repairs quickly and easily made by owner. Furnished with a complete equipment of fittings and fixtures. Quickly pays for itself.

May we send you our free complete catalog with valuable information?

ONTARIO IRON WORKS, Box 287 **PULASKI, N. Y.**

Furnishing Freight Cars When They are Needed

Good railway service to shippers consists in promptly furnishing freight cars when they are needed and moving them without delays after they are loaded. Farmers especially need such service.

In past years—even as recently as 1922—the railways were unable promptly to fill the orders of farmers for many thousands of cars, and this caused much well-founded complaint.

The railways have made great efforts and invested large amounts of capital to so improve the condition and operation of their properties as to prevent the return of such conditions. They have had valuable cooperation from the Regional Shippers' Advisory Boards.

As a result, even in the fall and winter of 1926, when freight business was the largest in history, all shippers were furnished daily an average of 99.7 *per cent* of all the freight cars for which they asked; and after being loaded the cars were moved more rapidly than ever before.

The unprecedented speed with which the large wheat crop of the southwest was rushed to the railways last summer would have caused a serious "shortage of cars" excepting for the increase in the efficiency of the railways that has been made within recent years. There would have been a serious shortage of refrigerator cars for handling the California grape crop last year excepting for the large increase that has been made in the number of refrigerator cars and the organized cooperation of the railways and shippers.

These are but two out of many examples that could be cited of ways in which increased railway efficiency, made possible by large investments of capital, has been of great direct benefit to agriculture.

The railways need the cooperation of the farmers to enable them to furnish at all times the kind of transportation that the welfare of agriculture requires.

WESTERN RAILWAYS' COMMITTEE ON PUBLIC RELATIONS

740 Transportation Building, Chicago, Illinois

We Needed One and So Do You

Many times at sales, farmers' meetings, on the street, in hotels, on trains and even at dances we have been asked for information regarding the Hoard's Dairyman herd. We missed many sales because we could not give our friends and new acquaintances all the information they wanted in definite form. In order to "be prepared" for these emergencies we planned the Hoard's Dairyman Vest Pocket Herd Book. The demand for them is exceeding our highest expectations The investment of $2.00 will come back to you many times and the satisfaction of having "your figgers" right handy is worth much more than the cost of the book.

Will accommodate 100 head. Loose leaves (easy to remove but firm during use); good leather cover; index, sketches, records breeding, service records, gestation table and blank pages for memoranda. All sent postpaid for $2.00.

A BOOK YOU WILL CARRY EVERY DAY

HOARD'S DAIRYMAN, Fort Atkinson, Wisconsin

Trailing Holsteins to South America

(Continued from page 309)

say, "The money required to keep it in fighting trim would operate many schools for our children."

Valparaiso is the largest city on the west coast and, approaching it from sea by night, resembles picturesque Seattle from Puget Sound. It extends considerable distance along the shore and backs on an unbroken rank of high hills. But it is getting darker and darker, the lights of the city make it look more and more like a forest of Christmas trees. The curiosity of the crew is dying and, after all, Valparaiso is just Valparaiso. It is only one of numerous ports in which this wandering crew of the Humming Bird has been. Save a carouse or a few drinks, or perhaps a little jaywalking, a foreign port holds no lure for the average seaman, and in the end one shuffles away, away to his bunk and the delight of quiet, and then another disappears, and so on, until they are all gone but my friend, the second mate. Before long there is no one to witness the chaos of contesting luminaries in the heavens and the playful slapping of waves on the weatherside.

The night air grows chilly. The second mate makes pretense at a sweater in his cabin and fails to return; so, lonely, I follow in his wake. The end of the trail to South America is here, and as I go aft to turn in, I hear a squeal, stop, and go on. Lindy is massacring another rat.

P. S. The cattle have arrived at the hacienda, San Vicente, in good condition. Their new home embraces the source of Aconcaugua Valley—50,000 acres, and with irrigation makes one of the world's garden spots. Again, as in Peru, cheap, reliable labor and not even a frost in winter makes dairying loom as a great industry in this country. Laborers receive forty cents per day plus a home to live in. Most of the farm work is done with oxen, which is most economical.

All about the premises of San Vicente are arbors of flowers prettily kept, blossoming magnolia, red-flowered pomegranate, chestnut, palm, eucalyptus, poplar, laurel, hawthorne, and alfalfa in abundance. Here, the life of a catch of alfalfa is 15-20 years.

We rode plump, calico-colored horses, with English saddles, several miles up in the mountains, crossing irrigation ditches often, viewing fields of ripening hemp, growing corn, cattle, thousands of sheep, and laborers working in most any direction you happened to look. The scenery was delightful.

Operated by the Susaeta brothers—Spanish gentlemen, San Vicente is a pioneer in dairying in Chile. At present they have a 150-cow dairy which consists of pure Holsteins. They yard feed, milk by hand, and have barns with the top half of the sides open and running water in each stall. A powdered milk plant is in operation on the hacienda, and everything is strictly modern.

South America has a future with promise ahead of it. It is wealthy with natural resources and virgin lands, and there are swarms of emigrants coming in from all parts of the world. There being no restriction on the Japs, they are flocking into Brazil in great number. Chile is 3,000 miles long and 100 miles in its greatest width. The north half is barren, rainless, and mountainous; this being where the nitrate fields are. Central Chile is arid, but with irrigation produces in abundance. In Southern Chile there is ample rainfall, forests, and good farming lands. Here, there are colonies of Germans ranching it and very prosperous.

But in going to South America there is one thing one should do; and that is to learn the Spanish language. Not the way you learn it in books here, but the way they speak it to you down there. There is a difference, and without a working knowledge of their tongue you are under a big handicap, no matter where you go.

(EDITOR'S NOTE:—This is the sixth and last of a series of six articles by Mr. Beattie.)

Wisconsin High Protein Barley

HOARD'S DAIRYMAN:—In 1898 when the Wisconsin Experiment Station started the breeding of barley, we built better than we knew. We did not favor the malting or brewing market at that time, but the chief thing that concerned the station was breeding a barley that had the highest possible feeding value.

It was felt at that time that the barley needed for the state of Wisconsin was a feeding barley and that farmers should feed barley more generously than they had heretofore. With the oncoming of the corn borer, we feel that this high protein barley is going to take an important part in the controversy. If the corn borer strikes Wisconsin, we will not be able to let our crops of corn mature the way we have in the past, but in order to get silage will be forced to cut it at a rather green stage. This is going to necessitate the bolstering up of the silage by ground feeds and no grain feed is going to function so well as the Wisconsin pedigreed barley.

If farmers were fully aware of the danger that is confronting them at this time, there would be no doubt but that the barley acreage would be doubled this year so that each and everyone would be prepared for the coming of the corn borer, which is sure to reach Wisconsin in a year or two. It is fortunate for Wisconsin that we have that large body of pure-bred seed grain growers that produce sufficient pedigreed barley each year to more than plant the barley acreage of the state.

Other States Alive to the Situation

It seems strange that far-away states have sensed this danger so much more quickly than the farmers in Wisconsin. We hope before the state is entirely drained of this fine seed barley that our own farmers will wake up to the necessity of putting in a goodly acreage of pedigree barley this year on their more fertile soils.

Barley bulletins will be sent to any farmers who are interested in the growing of this great crop and lists of seed grain growers can be readily secured by writing the College of Agriculture.

Wisconsin. R. A. MOORE.

MILK WAGON IN SWITZERLAND WITH POWER FORE AND AFT

Dairy Markets in 1926 and Comparisons

(Continued from page 310)

exceeding it, cheese production will apparently be some 5 per cent less, with condensed and evaporated milk showing even a greater reduction. The immediate situation is one of actual shortage in many sections, particularly those supplying cities with fluid milk.

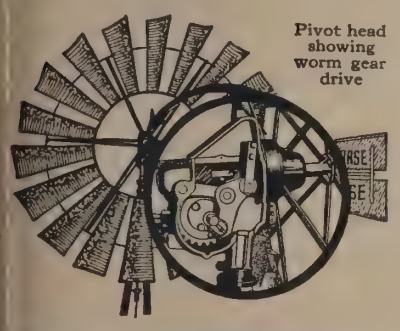
"One of the remarkable things all through 1926 was the active demand for dairy products, particularly butter. Even in December, when wholesale butter prices were up to 56 cents and retailers were charging well above 60 cents, the buying public continued to indicate a willingness to pay the price, providing quality was satisfactory. While high quality was commanding premiums, the same good demand did not exist for medium and low grade butter and producers of these grades suffered penalties throughout the whole year; the higher the price level the greater being the penalty.

"The close of the year finds the domestic situation on a sound basis, with the lighter 1926 production and an active consumptive demand standing out as primary elements of support. Prices are high, especially butter prices, but the inventory of reserve stock on hand suggests that it is plainly a case of supply and demand.

"Hog producers have a favorable outlook. The market supply of hogs probably will be little if any larger than in 1926, and domestic demand is expected to continue strong. Hog prices are likely to be maintained near the 1926 level. Prices now prevailing can be continued through 1928 only if farmers hold down hog production to the level of the past two years.

"Egg and poultry producers in most sections of the country may expect a fairly satisfactory year, although perhaps not as profitable as 1926.

"With beef cattle marketings in 1927 probably materially less than in 1926, and the demand for beef maintained, prices of slaughter and feeder cattle are expected to average somewhat higher than in 1926. On the whole, cattle prices are expected to continue the upward price swing begun in 1922."



World Trade

The following statement concerning our world trade in dairy products was issued by the U. S. Bureau of Agricultural Economics:

"Throughout the three months ended January 31, 1927, butter prices have been sufficiently low in European markets to maintain a margin in favor of domestic markets equal to or exceeding our import duty of 12c a pound. Accordingly, imports of butter have been considerable enough to make a total of 8,029,000 pounds for the year just closed, which is slightly greater than the 7,212,000 pounds imported in 1925 when the duty was 8 cents a pound. Comparative cheese prices have been similarly affected, and cheese imports were increased from 62,403,000 pounds in 1925 to 78,417,000 pounds in the year just closed. On the other hand, exports of condensed, evaporated, and powdered milk declined from a total of 151,412,000 pounds in 1925 to 114,549,000 pounds in 1926.

"Foreign prices had not, as late as the end of January, shown any recovery from the level prevailing in the middle of December when the Copenhagen quotation was 19 cents lower than for 92-score butter in New York. Rather, the narrowing of the margin to 12 cents by January 27 had come about wholly by reduction in the domestic prices. Butter of 92-score grade in New York was quoted at 56 cents on December 16 and at 48 cents on January 27, while the Copenhagen official quotations on the same dates were equivalent to 37 cents.

"Production and consumption of dairy products within the United States are now so closely balanced that a peculiarly delicate adjustment tends to prevail between domestic and foreign market prices. Despite the prevailing comparatively high protective tariffs on dairy products, it is demonstrated each year that developments affecting world prices determine the limits within which domestic prices may at any time advance or decline. The prevailing import duties make for a degree of price stabilization in our markets without being prohibitive of importations sufficient to make contacts between foreign and domestic markets and thus to bring about adjustments of prices between them. Furthermore, with dependence upon foreign markets for a part of the concentrated milk output of the United States, at the same time that fresh milk and cream, cheese, and generally butter are being imported, the markets for milk and its products in this country are never wholly free from the influence of foreign price movements."

The windmill that sets its own standards

IN the Steel Eclipse Windmill you will find quality and workmanship ordinarily considered too good for a windmill. And right there is the secret of its leadership!

No other windmill has all these features: worm gear drive, machined bearing surfaces throughout, machine-cut gears, drop forged crankshaft. Only the Steel Eclipse has the compact self-oiling mechanism enclosed in a rigid cast iron housing.

Starts sooner — pumps longer

MACHINED bearings with accurate, non-binding alignment reduce friction to the minimum. So the Steel Eclipse starts in the slightest breeze. Moreover it has less load to pull in doing a given amount of pumping because its job is distributed over two-thirds of the time that the wheel is turning—as shown by the diagrams opposite. It pumps as you would pump—at the end of the working stroke it makes a quick down stroke and *keeps the water moving*. Scientific design has put almost human intelligence into the windmill!

Let service-life and proved performance be your measures of windmill worth and your next mill will be a Steel Eclipse!

How much protein

Quaker Answers This Problem for All Dairymen by Providing a Complete Line of Dairy Feeds to Meet the Individual Needs of Each Farm.

Protein requirements vary, according to the quality and type of hay, other roughage, or pasture that are available. No single feed can meet all conditions, everywhere! That's why Quaker offers you a complete line of feeds—to give you exactly the combination that will return most profit.

Quaker Boss Dairy Ration is the ideal grain ration for cows receiving timothy hay, grass hays, straws, corn and clover, or poorer grades of clover.

Quaker Big "Q" Dairy Ration exactly meets the need of those herds receiving poor alfalfa hay, fair clover hay, or real choice mixed clover-and-grass hay.

Quaker Dairy Ration has no superior when cows are receiving choice clover hay, good alfalfa hay, or an excellent grade of fine mixed grass-and-clover hay; a good ration for dry stock and for young growing stock.

Quaker Sugared Schumacher Feed has a real place with dairymen when the herd is receiving liberal quantities of choice alfalfa hay. It combines beautifully with any Quaker high protein feed. For all stock—dry stock, horses, swine, sheep or steers.

All of these feeds contain molasses in dried form and are rich in the minerals cows must have to make milk

Choose the feeds that fit your conditions! Buy the feeds in striped sacks—Quaker Dairy Rations in red stripes; Sugared Schumacher in black stripes.

Send for the free book, "The Dairy Herd." This tells you just how to meet the peculiar conditions of your farm with Quaker Feeds.

Wisconsin Holstein Sales Association

Breeders from 15 Leading Holstein Counties Cooperating

600 Registered Holsteins

To be Sold April 12 to 21

AALTJE SALO HENGERVELD PONTIAC NO. 382874
A grandson of King Pontiac Champion and Pabst Hengerveld De Freule (10½ y.—39.15 lb.—1040.82 lb.). Consigned to Mauston Sale by Hattie M. Curtis.

125 BULLS—A number of 30 lb. bulls, and bulls out of dams having records up to 30 and 1000 lbs. Many of these bulls are show animals which combine high record backing and breeding to an unusual degree.

300 COWS—from 2 years to full age. These cows are splendid individuals of the practical producing type. Many of them have never been tested but are capable of making good records. On the other hand there are many richly bred cows included in this number that have good records—up to 30 lbs. There are daughters of Creator and Prilly including 20 lb. 2-year-olds.

175 HEIFERS—under 2 years. These heifers are good individuals from high producing, well bred herds. They are splendid prospects for building new herds, and are the kind that will make acceptable additions to practically any herd.

Order in which the Sales will be held is as follows:

APRIL 12 LAKE MILLS 70 Head
Breeders from Rock, Columbia, and Jefferson counties cooperating.

APRIL 13--14 MADISON 125 Head
Breeders from Dane, Iowa, Richland Counties cooperating.

APRIL 15 REEDSBURG 70 Head
Breeders from Sauk County.

APRIL 16 MAUSTON 70 Head
Breeders from Juneau County

APRIL 18-19 FOND DU LAC 125 Head
Breeders from Fond du Lac, Washington, Waupaca, Winnebago, Sheboygan and Manitowoc Counties cooperating.

APRIL 20 MARSHFIELD 70 Head
Breeders from Wood and Marathon Counties cooperating.

APRIL 21 NEILLSVILLE 70 Head
Breeders from Clark County.

These hogs belong to Frank Hazen of Ohio. Mr. Hazen gives his hogs clean quarters to sleep in and a clean place to eat. The feeding floor is cleaned daily.

Keeps Feeding Floor Clean

HOARD'S DAIRYMAN:—Frank Ha-n, of Marion County, Ohio, handles s feeding floor differently from ost farmers. His winter feeding gs spend most of their time in the rn that is bedded down to be sani-ry and comfortable. Here the hogs ve access to water and to minerals d to concentrates in self-feeders. These hogs do not go out into mud d filth. The picture above was apped on a soft February day, yet ybody can see that the Hazen hogs e clean and dry. The feeding floor dry also as the reader can see by ıall patches among the hogs. Twice day after feeding the floor is ɔoped off with a wide sheet metal ow shovel. If the weather is fine, course the hogs remain out in the n awhile, but when they are re-rned to the barn the floor is aned. By this frequent cleaning e job is a light one and the floor is y and comfortable for the hogs to ed on without slipping and sliding d encountering accumulating filth. These hogs are all vaccinated and r several weeks past the gains have eraged about two pounds a day. r. Hazen carries his hogs to about 5 lbs. weight.

Ohio. G. P. WILLIAMS.

Sudan Grass Pasture

The Kansas Experiment Station re-rts a feeding trial comparing al-lfa pasture with sudan grass pas-ture that should interest swine grow-ers particularly from the standpoint of supplying pasture.

This trial was carried on for 60 days from July 1 to August 30. Two lots of brood sows in good flesh were used; one being grazed on sudan grass pasture, the other on alfalfa pasture. The amount of grain fed per day per sow was the same in both lots. The average daily ration was 1.19 lbs. of corn, .13 lb. of tankage, and sudan pasture in one case, alfal-fa in the other.

These rations did not quite main-tain the weight of the sows in either case, the loss per sow on alfalfa pas-ture being 4.67 lbs. for the 60-day pe-riod, and 11.6 lbs. per sow for those on sudan grass pasture.

Not only did the sudan grass com-pare very well with the alfalfa pas-ture but a point of greater interest lies in the fact that sudan grass, be-ing an annual, may be used to good advantage as an emergency pasture for hogs during a time when other crops fall down in supplying palata-ble green forage.

Feed Laxative Feeds

A frequent cause of unrest and fe-verishness in sows at farrowing time is found in the way they are fed just previous to and immediately after they farrow. This condition contrib-utes to the loss of pigs from tramp-ing, scours, and many believe that fe-verishness has an influence in causing sows to eat their pigs.

The prevention is found in not only cutting down the amount of feed but also in changing the ration to one that is laxative. This should begin about three days before the sow is due to farrow. Plenty of water should be provided. One should not be too anx-ious to get the sows up on full feed immediately after farrowing. Crowd-ing the milk supply with feed at this time frequently causes scours, a con-dition to be avoided in young pigs.

One of the best combinations for feeding sows at farrowing time is a thin slop made from ground oats and bran. Corn should be avoided then.

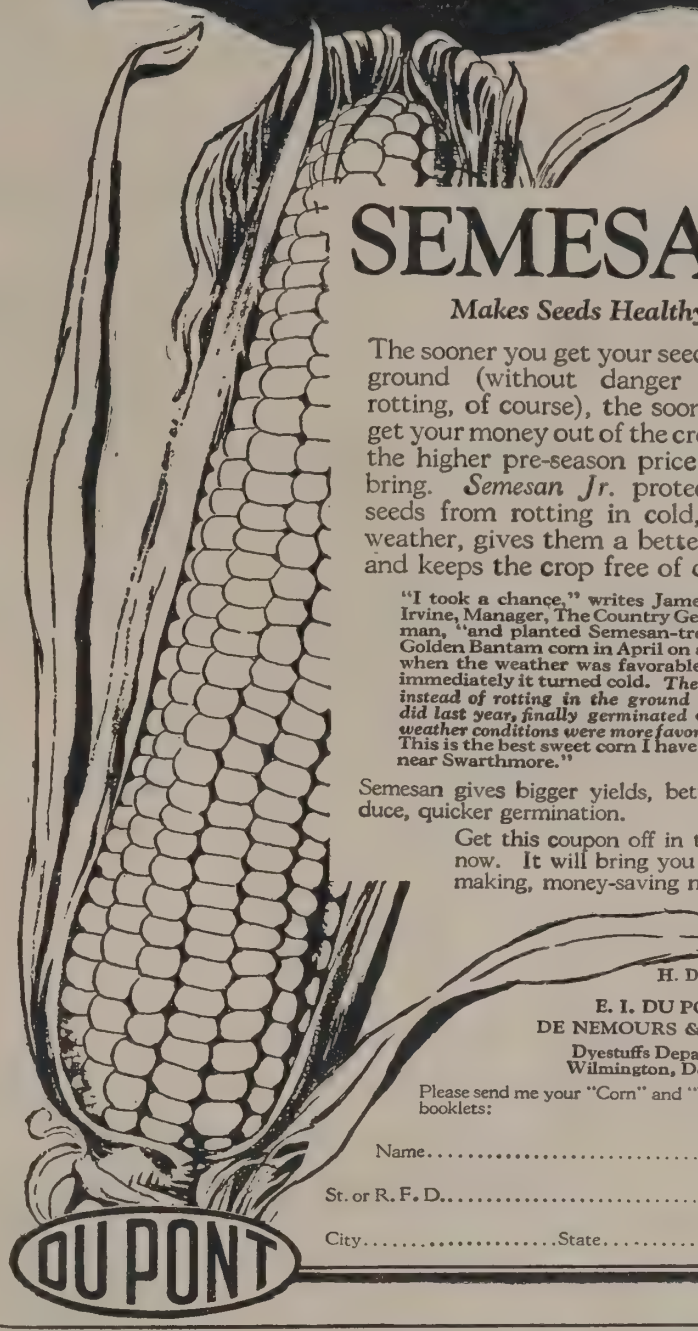
Thumps

The term "thumps" calls to mind the peculiar yet well known spasmod-ic action of the diaphrams of pigs less than three weeks of age. The ex-act cause is not well known. The fat-test, best looking pigs are the ones most likely to become affected. Thumps will invariably develop in small litters whose dams are good milkers if nothing is done to prevent the condition. The best known pre-vention is to force the pigs to take ex-ercise and to give them the advantage of as much direct sunshine as is avail-able. Turn the sows into the alley two or three times a day and chase the pigs around in their pens until they become tired. This will usually suf-fice to cure mild attacks and prevent the condition.

LIVINGSTON COUNTY TRUST COMPANY

To YOUNG FARMERS Seeking Opportunity

Investigate our attractive proposition:



Write to us for details regarding the fertile Genesee County of Western New York. We will tell you how good farms may be bought or leased on easy terms if you own your own farm imple-ments. These farms offer most alluring prospects for farmers en-gaged in dairying, raising can-ning crops, alfalfa and timothy hay, small grain, and sheep and cattle feeders.

Good roads, nearby markets, rail-road facilities, schools and churches make these farms most desirable. Address

Earlier Planting
No Rotting of Seeds

SEMESAN

Makes Seeds Healthy

The sooner you get your seed in the ground (without danger of its rotting, of course), the sooner you get your money out of the crop, and the higher pre-season price it will bring. *Semesan Jr.* protects the seeds from rotting in cold, damp weather, gives them a better start, and keeps the crop free of disease.

"I took a chance," writes James M. Irvine, Manager, The Country Gentleman, "and planted Semesan-treated Golden Bantam corn in April on a day when the weather was favorable but immediately it turned cold. *The corn, instead of rotting in the ground as it did last year, finally germinated when weather conditions were more favorable.* This is the best sweet corn I have seen near Swarthmore."

Semesan gives bigger yields, better produce, quicker germination.

CHLORAMIX
THE BACTERIA KILLING CLEANSER

More Money for Milk
—Less Labor in the Dairy

Here is the product that will help you produce Grade A milk and premium sweet cream.

Milk dealers are paying extra prices for milk of low bacterial count; cream buyers pay more for sweet cream than sour. Consumers are buying on quality.

Chloramix helps you to control bacteria that de-stroy quality, that cause souring, that rob you of your opportunity to get the higher prices.

Chloramix simplifies your daily task of cleaning and conditioning utensils and equipment responsi-ble for eighty per cent of bacterial troubles. Chloramix kills bacteria as it cleanses. It de-odorizes foul smelling corners; it sweetens the whole dairy. It does not hurt the hands; is safe to use; contains no poison; no grit to injure metal; kills bacteria as it cleanses.

Chloramix costs less than cleansers and disin-fectants bought separately to accomplish the same purpose.

Louse Powders

The control of lice on cattle and other farm animals during the winter season is a problem, as liquids cannot well be used. Powders, at best, do not exterminate lice and may only be regarded as fairly effective in lessening the numbers and activity of the vermin until dipping or spraying can safely be done. Just which powder or combination of powders to apply is a question.

Powdered sabadilla seed often has been prescribed as a louse destroyer and in this paper has been suggested as an ingredient of a louse powder; but we are puzzled to know whether it is quite safe to use. We say that for the reason that a farmer whose son applied it to the cows reported that the young man was nearly killed by the powder affecting his breathing organs. It seems that he had a sore throat at the time and that the dust at once aggravated the trouble so that he had to be taken to a hospital for treatment. As to that it may, of course, be stated that a person suffering from a sore throat or affected with a bad cold or bronchitis should not expose himself to any irritating powder, dust, or gas. It seems possible, too, that a person not so affected would not suffer any material discomfort from applying sabadilla powder or any other louse powder; but we should like to hear from others who have applied sabadilla and so determine whether it must be used with great care or entirely abandoned as a louse destroyer.

In this connection it may also be well to state that some people have an individual idiocyncrasy against certain drugs, and sabadilla possibly is one of them. We have heard of a person so sensitive to the effect of ipecac that he would vomit were a bottle containing the tincture merely opened in his presence. Some people, as is well known, are peculiarly susceptible to poison ivy eruption and irritation, while others handle the weed with impunity. We have only heard of one complaint against sabadilla, but we certainly shall not feel confident in prescribing it if others report similar poisoning or irritation. The drug contains the alkaloid *veratrine* which is deadly to lice and must, in consequence, not be inhaled or swallowed. It might be better to cover the nose and mouth with a cloth, while making the application, or to apply it outdoors where the dust will not be so likely to be inhaled. The treated animal should also be blanketed immediately after the application.

No reports of bad effects have been reported from the application of powdered pyrethrum, another louse destroyer; but much of that powder is so "shop-worn" or so much adulterated with powdered ox-eye daisy flowers that it is ineffective. Knowing that, we have thought it well to prescribe a mixture of the drug with powdered sabadilla, flowers of sulphur, and powdered tobacco leaves or tobacco snuff. A mixture of equal quantities of Portland cement and flowers of sulphur has even been suggested by one cow owner as an effective louse destroyer. The latest drug suggested is sodium fluoride which has given good results in controlling lice of poultry, either when used as a powder or in solution. We have not had sufficient experience with it, for cattle louse destruction warrant recommending it for gene use and some have found it irritat at the time of application. Reports its value will be welcomed.

Books are Balanced

Can you tell me where science begins luck ends in cow breeding? I have a of forty grade Guernseys. For the past years they have brought me three he calves. I have used three bulls; bred t when coming in heat and going out, and and odd times; also bought six cows—t bred to Guernsey and three to Holstein b The three bred to Holsteins came in

NO HOLD BACK

When the milk comes hard—when t cow is nervous and fidgety—you are l ing milk you ought to be getting. A disorder or hurt to the udder or teats, matter how slight, can undo all of yo efforts to get a full milk yield.

Bag Balm is a marvelous healer of injuries to the delicate tissues of t udder and teats. Sore teats, chaps, cu inflammation disappear quickly und the soothing, penetrating action of th greatointment. For Caked Bag, Bunch Cow Pox or any stoppage of the m passages Bag Balm gives quick relief.

Bag Balm is a wonderful healer of annual sores—and it *can't taint the mi* The big 10-ounce package, 60c at fe dealers, general stores, druggists. B ware of substitutes. Order direct fro us if you have difficulty in getting B Balm.

black heifer calves and from the Guernsey bulls came all bull calves. Do you suppose it will ever turn the other way?
Topeka, Kan. H. N. R.

Nature "balances her books" in such cases. Your cows may next have a preponderance of heifer calves, but there is no certain method of determining sex by breeding so that science fails. It is as certain that there is no such thing as "luck." "Sufficient unto the day is the evil thereof" and we must also be thankful for our mercies!

Osage Orange Poisoning

As tester of a cow testing association I find that among many of the members there is a strong belief that when the cows eat the balls that grow on hedge trees it will cause them to dry up. Is there any ground for such a belief? They also think the same about the pods from locust trees.
Fort Scott, Kans. C. W.

Some people are susceptible to osage orange poisoning, even when handling the leaves, but the thorn puncture is most painful and serious. Most people are not affected by the leaves. We have many times heard that the osage orange fruit causes a shrink in milk flow when eaten by cows but have no personal, corroborative evidence to that effect. However, we are strongly of the opinion that when an osage orange hedge has grown into trees which develop fruit or "balls" it has become an intolerable nuisance and should be grubbed out. There is no need to expose cows to possible danger from eating the balls. The bark of the black locust is notoriously poisonous for horses and the pods may have the ill effect you suggest, but we have no data on that phase of the subject.

"Losing Cud"

I have a 2-year-old heifer coming fresh this spring that has been sick for one month. She would not eat for the first ten days. Now she eats ground feed. She acts as though she wanted to suck or chew. When she does this she froths at the mouth. This is worse after she drinks. She gets only lukewarm water and a little separator milk. Is there such a thing as a cow losing her cud? I thought this was what was the matter.
Stillwater, Minn. O. P.

"Losing of the cud" is not a disease, but rumination (cud chewing) stops when there is derangement of the digestive organs or some serious disease affecting the system. It is resumed when the discomfort and disease subside. An artificial cud of salt pork, red herring, or some such substance, given with the idea of curing" lost cud, stimulates secretion of saliva and causes the cow to work the tongue in her mouth, and consequently may induce temporary cud chewing. There is no special merit in such treatment. In the case in question we suspect presence of some foreign object lodged in the mouth and that should be removed, or the teeth may need attention. Actinomycosis of the tongue ("wooden tongue") is another possibility and would require special treatment. Write again, if necessary, when the mouth has been examined.

Abortion

1. Is there any remedy of any value on the market for contagious abortion?
2. Will contagious abortion develop in a herd without coming in contact with infected cattle?
3. Will heifers that have not come in heat get infected same as mature cows?

I am having a great deal of trouble with my cows aborting the past year.
Melrose, Iowa. J. B. W.

1. We know of no specific or certain remedy for the contagious abortion disease, but the infection can be gotten rid of in time by putting into effect the methods of control advised in bulletins on abortion published by the U. S. Department of Agriculture and the state experiment stations which you should obtain and study.

2. The disease can only be caused by invasion of the cow's system by the casual germ which is the *bacillus abortus* of Bang. However, abortion may also be caused by accident, or possibly by the ill effects of moldy or damaged feed, or by inadequate or incomplete feeding. The chief source of the contagious disease is feed contaminated by the vaginal discharge of an affected cow. Your cows possibly were infected in that way.

3. Heifers, before arriving at breeding age, may be so infected that they abort when pregnant. To determine whether your heifers or cows are so infected, a sample of blood from each of them should be tested by the agglutination method at the state experiment station, veterinary department. Your veterinarian can attend to that. Meanwhile isolate cows that have aborted and then cleanse, disinfect, and whitewash the stable, including the floors and gutters. Have your veterinarian give discharging or barren cows such treatment as he deems necessary.

Tuberculosis Infection

If a cow has tuberculosis, is her calf liable to react also, even if it has not been fed on her milk?

We had our herd tested awhile ago and two cows out of 48 reacted. Before these two cows reacted something went wrong with their spines, so instead of cooling their milk and sending it to town, I fed it to the calves for about two weeks until they were all right again. I am therefore anxious to find out if the calves fed on these two cows' milk will react also.
South Africa. P. S.

Tuberculosis is not hereditary and the calves in question may be raised free from the infection if fed milk from nonaffected cows and kept absolutely away from infected premises and affected cattle.

Goodness made Camel famous

CAMEL is the cigarette that won the world through quality. Camel's blending can be found nowhere else. It is rolled of the choicest Turkish and Domestic tobaccos grown. Even the cigarette paper is the finest—made especially for Camels in France.

If you want smoke enjoyment full and satisfying, get acquainted with Camel cigarettes. They will never tire your taste nor leave a cigaretty aftertaste, no matter how many of them you smoke. To light a Camel is to discover a goodness in tobaccos — an entirely new sense of smoking pleasure.

Camels are famous because they are good. They lead the world in popularity and demand. They invite your comparison with any cigarette made.

Farmers are invited to spend this summer in Oregon. Oregon is a very beautiful state with a temperate climate and all kinds of outdoor sport and recreation. Oregon is also an agricultural state—with a more diversified soil and a greater variety of crops than almost any state in the Union. You will enjoy a vacation in Oregon and perhaps, if you are contemplating a change, may find the ideal new location you have been looking for . . . mild winters, cool summers, good markets, good schools and splendid highways. Write, today, for any kind of information to the publicity dept., room 744, PORTLAND CHAMBER OF COMMERCE, Portland, Oregon.

Dairy—Have an ideal location for a dairy close to Casper. Will sell at a sacrifice, irrigated, ditches all in, water right fully paid, gravity flow from the Platte river, bottom land, sandy loam soil, under cultivation, 320 acres—more acreage can be arranged for—5 room house, large barn, fenced and out buildings. $70.00 per acre, 1-3 cash, 5 years on the balance. Casper and vicinity ship in 75% of her dairy products. 40,000 population for a market and milk wholesales at 52c per gallon. For further particulars write J. E. NELSON, 1044 E. First St., Casper, Wyoming. 4-3

Dairy farm 160 acres, Barron County, Wis. Modern 8-room house, light and water. 2 barns; 1 has cement floor, 16 stanchions; silo. Cement floor granary; machine shed; tile milk house; hog house. Position wanted on large dairy farm as working foreman by married man. Life experiences. Three years on last place. Sale of farm reason for change. References as to character and ability. Address BOX 343, care Hoard's Dairyman.

Young man wants work on dairy or grain farm. Experience in milk house and route work and can handle all farm machinery, including tractors and trucks. Reference if necessary. Address BOX 335, care Hoard's Dairyman.

Wanted—Position as working herdsman or entire charge of test cows. College training, practical experience, 35, married, no children. Address BOX 337, care Hoard's Dairyman. 6-2

Young Danish man wishes work in a creamery or cheese factory. 9 years' experience. Any place in U. S. A. Write A. PEDERSEN, 518 62nd Ave., Milwaukee, Wisconsin.

Herdsman wants position taking care small herd of cattle. Single, age 25. References. Prefer Wisconsin. BOX 338, care Hoard's Dairyman.

Capable dairy farm manager desires good proposition. Shares, or salary. GRANT E. VOLLAND, Brookfield, Wisconsin.

Experienced farm hand desires position. Do not use tobacco. State wages and fully describe work. WALTER CORDING, Boone, Nebr.

Scotchman wants job as calf man. 12 years last job. Experience at shows. JOHN McCORMACK, Iowana Farm, Davenport, Iowa. 6-2

Wanted by April 1st work on dairy, or general farming. 8 years experience. H. KITSMAN, Eau Claire, Wis.

Four Wisconsin Holstein Herds Sold

The dispersion of the Walcowis and J. W. Houard Holstein herds at Waukesha, Wis., March 1, brought out buyers from seven different states who were willing to pay fair prices for good animals.

Eighty-seven animals—the two herds—averaged $183, with the Walcowis herd of 58 head averaging $194. Carnation Milk Farms paid the top price, $410, for a 2-year-old granddaughter of Iowana Sir Ollie from a 908-lb. dam.

The average for animals of the different age classes were as follows: Five bulls of all ages averaged $194; 34 cows 4 years old or over averaged $222; 3 three-year-olds averaged $242; 8 two-year-olds averaged $240; 37 heifers under 2 years averaged $125.

At the dispersion of O'Connor & Sons' and Lawritz Larson's herds March 2 at Watertown, Wis., 100 head brought $13,180, an average of $132, with $330 the top price.

Averages for March 2 follow: Three bulls averaged $91; 34 cows 4 years old or over averaged $173; 12 three-year-olds averaged $155; 18 two-year-olds averaged $155; 32 heifers under two years averaged $70.

Haeger, Baird, and Darcey managed the sales, and Mack and Haeger did the selling.

Census of Dairy Products

The Department of Commerce announces that, according to data collected at the biennial census of manufacturers taken in 1926, the establishments engaged primarily in the manufacture of butter, cheese, and condensed milk reported, for 1925, products valued at $973,827,000, an increase of 1.9 per cent as compared with $955,350,000 for 1923, the last preceding census year.

The total for 1925 was made up as follows: Butter, 1,445,204,000 pounds, valued at $632,373,000; cheese, other than cottage, 504,186,000 pounds, $111,286,000; cottage cheese, 50,161,000 pounds, $4,159,000; condensed and evaporated milk, 1,799,694,000 pounds, $144,866,000; powdered milk, including dried and powdered buttermilk, 110,684,000 pounds, $11,865,000; "ice cream mix" or stock, 85,361,000 pounds, $9,215,000; miscellaneous products, such as butter oil, dried casein, sugar of milk, canned sterilized milk, surplus milk and cream sold, skimmilk, buttermilk, etc., $60,063,000.

Of the 6,830 establishments reporting for 1925, 2,726 were located in Wisconsin, 863 in Minnesota, 523 in New York, 417 in Iowa, 292 in Michigan, 202 in Ohio, 201 in Illinois, 164 in Pennsylvania, 162 in California, 124 in Oregon, 121 in Washington, and the remaining 1,035 were distributed through 26 other states and the District of Columbia.

Soil Management

A good example of finding out what the soil needs and then giving it the proper treatment is shown by an Indiana soil fertility experiment begun in 1913 at North Vernon. The land, although it had been receiving some manure and fertilizer, was averaging less than 30 bushels of corn to the acre. The soil was naturally wet, sour, and low in available plant food. With proper tile drainage, liming to correct soil acidity, and the application of six tons of manure and 200 lbs. of acid phosphate per acre per rotation, the average yield of corn for the four crops of corn since corn first followed clover in the rotation was 80.6 bushels per acre.

Losing?

A pound here, a pound there. Look out! Watch those little discrepancies. Often they are the difference between profit and loss.

But you don't KNOW unless you use a scale — a good, reliable scale that will tell you exact weight of everything you buy and sell.

Put this scale on your farm, as hundreds of farmers have done. It is a genuine, Fairbanks long-life scale. Has the latest improvements including Easy-Reading Poise and Arrow Tip Beam.

Have your dealer show you this scale. Quantity production permits the extremely low price.

FARROW CHIX FOR SUCCESS

WINTER EGGS

200 EGG STRAIN

BANKING

Buyers of Farrow Chix start banking their winter receipts sooner than raisers of unknown Chix.

Our 200 egg strain are positive winter layers

MORE WINTER EGGS

This is the cry of thousands of poultry raisers. When eggs are high and profits the greatest you need Farrow Chix to fill the egg basket. Our Star Matings White Leghorns—bred to produce 200 egg pullets—can do this for you. A few dozen eggs in winter will more than pay difference in cost of these chix and common stock.

You can't get blood out of a turnip. Neither can you expect to have laying chix from non-laying hens. Be sure of winter eggs and order our Star Matings. They are winners in egg contests. They will win for you. Tancred, Hollywood, Barron blood lines. Chix from America's Wonder Layers.

Poultry on the Dairy Farm

Poultry Record Work Pays Dividends

HOARD'S DAIRYMAN:—Inheriting a flock of Barred Rock chickens from another member of the family and building up the flock to a high production standard has been the experience of Mrs. C. L. Wiles of Cass County, Nebraska. Co-operation with the college of agriculture extension

MRS. WILES AND ONE OF HER RECORD HENS

service in the poultry record flock work enabled Mrs. Wiles to gradually raise the egg production of her flock from 118 eggs the first year to 123 eggs the second year, then to 132.6 eggs the third year and, finally, at the close of the fourth year in the record flock activities, to make a record of 148.6 eggs per hen.

This consistent increase in average production per bird, Mrs. Wiles attributes to the lessons secured in the record flock activities—lessons on housing, lessons in sanitation, lessons in feeding, and lessons in culling. Mrs. Wiles also appreciates the fact that being enrolled in such work gets her in touch with hundreds of other men and women who are engaged in similar work.

Asked by the writer why she preferred the Barred Rocks, Mrs. Wiles said: "The Barred Rocks, in my opinion, have about the finest meat of any breed. They are especially good as broilers. My egg records show that they are a real dual-purpose breed."

Two feeds which Mrs. Wiles regards as well nigh indispensable, especially during the winter months, are sweet milk and soaked oats, fed in connection with a regulation laying mash. The soaked oats are always fed in the morning. They are soaked all night and in the winter are heated before being fed. Alfalfa is a feed whose virtues in the poultry ration is never doubted by this poultry woman. A load of good alfalfa hay is stacked near the poultry house each fall and covered to keep out rain and snow.

Although some of her neighbors may be enthusiastic about marketing broilers, Mrs. Wiles feels that when one has a pure-bred flock of birds there is more money in keeping the fowls a little longer and selling the males and females as breeding stock. Her standard laying mash consists of ground corn, oats, bran, and salt. She does not use bone meal, feeling that the sweet milk takes its place. Use is made of plenty of wood charcoal and oyster shells at all times.

Nebraska. H. HOWARD BIGGAR.

Cod Liver Oil for Poultry

HOARD'S DAIRYMAN:—We read about feeding cod liver oil to the poultry flocks and the benefits that accrue from it, but most of these writings are not very definite in methods or amounts to be fed. For two years past we have been feeding the oil and we do not hesitate in recommending its use. It is not a cure-all but it is one of the best preventives of disease and trouble that we are acquainted with. Curing sick hens and chicks is a mighty unsatisfactory process, anyway. Prevention of disease is much better.

The usual method of feeding the oil to young chicks is by mixing with the mash. One pint daily to five hundred chicks has been the formula used; that is, one pint of oil is mixed with the amount of mash placed in the hoppers each day. This year we have tried out a different method. Just before dark the chicks are fed all the scratch grain they will consume. It is placed before them in a hopper so they can get it quickly, the theory being that the crops should be stuffed just before the long sleep of twelve or more hours. Before the grain is placed in the hoppers it is moistened with oil and worked over with the hands, until every grain has a coating. The chicks do not object to the oil, indeed they seem to like it after they get the taste. By this method we use something like one pint daily for five hundred chicks and all of them get a share. This means for chicks three or four weeks old. Each day they get practically the same amount, while the oil is always fresh. When mixed with the mash, it may become rather stale before the chicks eat it.

We are feeding a flock of laying hens in the same manner, administering the oil in connection with the last feed of scratch grain just before dark each day. We feed a certain amount of grain each day and use enough of the oil to coat each kernel in good shape. We believe we should feed enough of the oil to see results. It does not add greatly to the cost of feeding when the oil is purchased in bulk. We feed at least a half pint a day to each one hundred birds. Our plan is to pour enough over the grain to moisten it thoroughly, both in the case of chicks and old birds.

Cod liver oil is an excellent medicine for ailing birds. We had several hens come down with some trouble which appeared to be paralysis. We separated them from the flock and administered three doses of oil with a medicine dropper each day until they got on their feet and recovered. The oil has a wonderfully invigorating effect upon the appetite, hence it is valuable with the molting birds. We believe its use will shorten the time of molt very materially.

Chicks and older birds which are kept closely housed particularly re-

spond to the oil treatment. Chicks grow faster and winter broilers are ready for market several days earlier as a consequence of feeding it daily.

Cod liver meal is now on the market, but there is a question whether the oil in this form retains its potency as long as does the pure oil. Get a good quality of oil and do not be afraid to feed it without stint.

CHARLES H. CHESLEY.

New Hampshire.

Turkey House

In your Hoard's Dairyman of January 25 you show a picture of a turkey house. I would be very pleased if your could send me more particulars about it. I keep over 12 or 15 hen turkeys each year but have never had a house for them.

L. Waterford, Vt. J. W. D.

The house illustrated in Hoard's Dairyman of January 25th is just a building tightly boarded on three sides with a wire front which answers the requirements for a satisfactory turkey house in that it is draft proof, being closed tightly on three sides and acts as just a shelter for them and also aids in the protection for the birds.

A person wants in building any type of a house for turkeys, which is merely a shelter, to be absolutely positive that there is no possibility of draft occurring. I know of one instance of a turkey farm where they had a severe outbreak of roup and associated ailments in a flock and upon visiting, at their request, found that they had drawn two colony houses up, allowing a space of about two feet between them and put a bunch of roosts across there and then had boarded up the back with a roof over it, and this back was just rough boarding with knot holes in it; in fact, there were some places that were cracked two or three inches wide. This, of course, caused cross drafts which resulted in the colds. The rest of the flock which had roosted out in the trees was not bothered because they were not in a drafty roosting place. They thought they were doing them a kind act in supplying this protection, but the birds would have been a great deal better off in the open than roosting under these conditions.

The investment in a house such as this is very small, since we do not attempt to emphasize heat or uniform temperature or any of those things which we do in a regular laying house for poultry.

There are no plans that I know of that are available for buildings such as this, but I believe that the pictures given show up enough so that it illustrates this type, and the same is true of any other building which we might wish to construct.—J. B. Hayes.

Lameness

We have some kind of a disease in our chickens that I would like to have your advice on. When they first get sick they refuse to even as much as drink water. They live for about two weeks. They get lame and when they die their heads get real dark red. Is there anything that we can do to stop the disease?

Sherburn, Minn. W. B.

The symptoms given in this case are very meager on which to attempt sort of a diagnosis of the trouble in the flock.

The lameness noted is probably due to either one of two causes. When we hear of any prolonged sickness in the birds followed by death, associated with lameness, we usually suspect that it is due to avian tuberculosis. In this case you will find upon posting out one of the dead birds that the liver is spotted and you will also find this condition true of the spleen. Usually in bad cases the nodules will be found on the intestines and the bird is very, very thin and emaciated. If those conditions appear when you

Genoa Quality Chicks

Several years of hatching, rigid culling and selecting has given us chicks that verify our claims for QUALITY. Our flocks are headed by Males from Mahood, Harrison, Bonnie Brae, J. T. AT ASTONISHING LOW PRICES. WHY PAY MORE?

Genuine high quality is found only in chicks from stock bred many years for laying ability and exhibition purposes. Sieb's Certified Chicks are produced from flocks bred thru generations for these qualities. Every bird in our flocks HOGAN TESTED and certified for high egg production.

PROOF OUR CHICKS ARE BETTER

We received hundreds of letters similar to these. It shows why our customers are PLEASED and SUCCEED. Mr. Roy Burke, Wis., writes—the 150 Ancona chicks arrived May 3. I raised 144 of them. Pullets started laying Sept. 27th. Sold some cockerels at $25.00 when eleven weeks old. Kindly mail me your new catalog my order will go to Sieb Hatchery again. Mr. Geo. Wood writes—The red chicks received from you last year were the best I have ever seen. I sold some of the pullets at $1.50 each. The laying average of my flocks last Fall and Winter was 71%, while the so called celebrated Leghorns around the neighborhood were idle. 71% FLOCK AVERAGE during Fall and Winter is equal to a yearly average of 255 EGGS PER HEN. Why experiment with others when you can get this quality at our low price? Sieb Certified Chicks are of only ONE GRADE—the BEST. SEND FOR CATALOG or order direct from this ad. 97% live delivery guaranteed, prepaid.

open up a dead bird you can feel positive that it is due to this trouble.

In other cases we find that lameness is often associated with worm infestation in the flock. In these cases one can open up the caeca, or those two pouches that we find extending off the intestines or the intestines themselves and the worms will be found there in big numbers.

In cases of T. B., of course it means a clean-up of the entire flock in the spring of the year with the necessity of raising the young flock brooded under artificial conditions on clean ground, keeping them there until fall, selling off all of the old birds in the spring of the year and then not keeping any birds on the range until the stock is brought in the following fall. With this procedure one can usually clean up in one year. No medicine is of any advantage.

For worms there are two methods recommended, one the Kamala treatment for tapeworms, the other one is the nicotine sulphate capsules for roundworms. These have both worked out to the satisfaction of a great many people.

Until you are sure of what the trouble in the flock may be, I should advise that you give the entire flock Epsom salts at the rate of 1 pound to 100 birds in a moist mash or in the drinking water. If the trouble is due merely to some decomposed material that the birds have picked up, causing poisoning, this will straighten them up to some extent. I doubt very much whether this is the case, however, since poisoning usually means the death of a bird in a short time, and you state that they usually hang on for about two weeks.

It would also be well for you to check this with your local veterinarian or to send a specimen in to the Veterinary Department of your State University, providing you cannot get the advice of a local veterinarian. This would be a whole lot more conclusive than it is possible to do merely by the symptoms which you have indicated in this case.—J. B. HAYES.

Size of Brooder

My wife and I have always hatched and brooded chickens in nature's way, but this year we plan to build the 8x12 brooder house recommended by the Wisconsin Experiment Station and brood 300 baby chicks in it. Are we overestimating the capacity of the house? What size brooder would safely handle these chicks?

Blanchardville, Wis. W. R. B.

If you contemplated brooding 300 chicks as one lot it would undoubtedly be advisable to construct the 10x12 colony house rather than the 8x12, since we can never depend upon our spring conditions and it may be necessary to carry these birds in confinement over a longer period. Undoubtedly if we were sure of being able to turn them loose on range at an early period, the 8x12 house would accommodate the bunch during that time in a satisfactory manner.

For a 300-chick lot a person would be justified in probably buying the so-called "1000-chick size" brooders. The principal advantage in this is that they usually carry a larger magazine on the stove which necessitates coaling only twice a day. Many of the smaller chick size, such as the 500, carry a smaller magazine and during extremely cold weather it may be necessary to give attention to this stove three or four times a day. A recent change, though, in a great many of the stoves has been made in that the only difference between the two is in the size of the canopy and the stove and magazine are the same in each instance. The size required would be to a great extent determined by this.

Another advantage which lies in buying the larger one probably comes from the fact that if you did in the next few years plan on obtaining a larger number of chicks than the 300, they could still be accommodated under the 1000-chick size, while the 500 would be usually too small.

There isn't any general application to the rule but most of the brooder stoves are double rated, in that the 500 should be used for about 250 chicks and any number above that a person should invest in a 1000-chick size and then plan on carrying about 450 as the maximum number in one lot.—J. B. HAYES.

Worms in Poultry

We are having trouble on the farm among our several hundred W. Leghorn hens or perhaps I should say pullets only. The ailment perhaps first is noticed by drooping wings, later a staggering gait, then more or less complete paralysis. When bad they flop around helplessly till they die or maybe they will remain in that condition for a long time; a few seemingly recovering. The appetite in many cases seems good and they act like they had lots of pep though their efforts end like those of a drunken man. I surmise that we have lost half a hundred and we are not the only ones by any means.

Now we know that long worms infest them and no treatment that we have tried so far eliminates them. Where the worms came from we do not know as all the flock were secured as baby chicks and we have no reason to think that the soil was infected, for last winter the smaller flock did extremely well and we saw no symptoms.

I might say that so far as we know the tapeworm is not troubling us and we have been feeding a balance ration and they have fresh running water from the house supply which is piped to the runs.

Scottsdale, Ariz. C. H. E.

There are one or two possibilities which might be the cause of the trouble which is noted in the pullet flock of White Leghorns. The first and most prevalent, of course, is that paralytic condition in maturing stock which is indicated in cases where the birds are infested with worms, either tapeworms or roundworms. For the elimination of the tapeworm, tobacco dust has usually been recommended, but has not been giving satisfactory results. A second method, and a very stringent one, was the use of the lye treatment when given with some sort of grain.

Recently most of the stations have recommended the drug known as kamala, which has apparently been satisfactory as a treatment of tapeworm. It has sometimes been said that this could be given to a flock without any serious or noticeable after effects.

This, apparently, depends entirely upon the condition of the flock at the time it is given, since in one instance a number of the decidedly weakened birds were lost and the entire flock had quite a setback. In another instance, I know where the drug has been administered three times during the year, and aside from the loss of the very emaciated, decidedly weakened individuals, no noticeable effects were observed.

I believe that a person can take it pretty much for granted that if the treatment is going to be satisfactory in expelling tapeworms from a flock, it is going to be sufficiently severe so that a setback will be noticed in the bird, and those producing at that time will be thrown out of laying condition and the entire bunch will indicate sort of a droopy condition. There may also be some deaths in the flock as a result of the weakened

GLOVER'S
IMPERIAL DOG MEDICINES

ones being unable to survive the treatment. These birds will undoubtedly die anyhow, and one can be certain that the flock will not produce satisfactorily until a satisfactory worm treatment will be followed. For this purpose, kamala can undoubtedly be recommended.

We have also rather believed that there is another condition in a flock where the pullets or about half matured birds would indicate something wrong by paralysis that may or may not be associated with worms. This is noticed usually in birds that are about half matured, but I believe in most cases that we should treat them for worms even under those conditions.

As long as the young birds are running on the range that the old birds have been on, or even in case they haven't been on, there is a chance for worm infestation, and we all, undoubtedly, will soon come to a point where sanitation of poultry range will become of greater importance, and even then we will undoubtedly adopt the practice of treating our birds internally for worms, before they go into winter quarters, just exactly the same as we treat them externally for other purposes.

I rather believe that between the two possibilities the worm condition in the birds is to blame for this trouble since this indication of drooping wings and staggering gait and more or less complete paralysis is usually associated with worms in poultry.—J. B. HAYES.

Wet Picking Poultry

The wet method of picking poultry was demonstrated by H. J. Rahmlow at the recent Farmers' Week at the Wisconsin College of Agriculture. His remarks were, in part, as follows:

"You will notice we brought the chickens here alive. That is to demonstrate the first essential step—don't kill the chicken a long time before picking, as the muscles will set and it is more difficult to take the feathers off.

"The second essential is the temperature of the water. Boiling water will cook the skin and set the feathers. This is especially true with broilers, as the skin is torn if the water is too hot. Water too cool will not loosen the feathers. Scald pickers do not agree on the proper temperature; between 170 to 190 degrees Fahrenheit is all right. I prefer the lower temperature for younger birds. It will pay most poultrymen to have a floating dairy thermometer, which can be bought for less than $1.00. A good guess, without a thermometer, is one gallon of boiling water and one quart of cold water.

"The third essential is to leave the birds in the hot water for the right length of time. For fast picking a number of birds are dipped at one time. Dip until the long wing feathers pull out easily. It is necessary to try them often. Stop dipping as soon as the wing feathers pull out easily, or the feathers will set again to a certain extent and the skin will tear.

"Lay the bird on a smooth table. If the table is wet and has feathers on it, less bruising will result.

"First, grasp the wing close to the body, and with a gentle twisting motion rub the feathers off toward the tips of the wings. All feathers will come off quickly. Keep a few feathers in the hand and gently rub the feathers from the side and leg in the same direction as the feathers lie, and then repeat on the other side. The feathers on the back and neck are usually rubbed in the opposite direction.

"With a little practice any one in this audience can take the feathers off a bird in less than 15 seconds. If the bird is dipped in cold water as soon as it is picked it will improve the appearance and make it look plump.

"Scald picking has the merit of requiring less skill and being quicker than dry picking. On the other hand, it soaks the skin which seriously injures its keeping quality.

Turkeys, ducks, and geese can also be picked in this way, but it is better to dip burlap or a blanket in boiling water, and leave the bird wrapped in it for 10 to 15 minutes to steam it.

"In singeing the birds do not use printed paper, gasoline, or wood flames, as they smoke the carcass. Plain wrapping paper is all right, as well as gas or alcohol flames. If a good job of picking is done, very little singeing will be necessary."

What Good Hen Eats

What one good hen eats in a year was shown by the poultry department of the Minnesota College of Agriculture in an exhibit at the Minnesota State Fair. Of scratch grain she consumes 20 lbs. cracked corn, 10 lbs. oats, 10 lbs. barley. Her laying mash which is fed dry in a hopper totals 8 lbs. each of corn meal, ground oats, wheat bran, wheat middlings, and beef scraps with the addition of 1% charcoal and 1% salt. She eats 4 lbs. of oyster shells and 2 lbs. of grit fed separately in a hopper. Her feed bill totals $1.523 a year.

If she eats she must more than pay her board bill, says the poultry department, and they showed the yearly egg production of four different hens: 1, pays board and little more; 2, pays board and 90 cents; 3, pays board and $1.80; 4, pays board and $4.70.

Laughter is like oil to machinery—it soothes many of the hard places as we go along through life.—Mead Co-operation.

Town Line POULTRY FARM

the PERSONAL SERVICE Hatchery

Michigan Accredited 96 UNCULLED PULLETS LAY 7,611 EGGS FROM SEPT. 1, 1926, to JAN. 1, 1927, writes customer from Muskegon, Michigan. This is an average of 21 eggs per pullet per month. BROWN SWISS

Brown Swiss Bulls Mark Imprint on Grade Herds

Extra large production in a herd of grade cows may be gained by breeding with a Brown Swiss bull. They sire strong calves of a uniform type, well adapted for the general dairy farm. Mature bulls weigh between 1,800 and 2,500 lbs.

We will be glad to help you secure a Brown Swiss bull and, if you desire, a heifer or a cow.

Write Your Own Farm Relief Bill

Good dairy cattle afford immediate relief to those who have been following an unprofitable system of farming. The income from dairying is not seasonal, and the industry as a whole is prosperous.

Jersey cows have the knack of staying on the job all year, and year after year; producing milk or butterfat at a low cost.

Full information on Jerseys or assistance in locating stock will be furnished without cost. Write to us today.

THE AMERICAN JERSEY CATTLE CLUB, Dept. B,
324 West 23d St., NEW YORK

Jersey Bull Calves

We are offering at reasonable prices a few bull calves sired by Vive La France's Darling Son and out of cows of rich Sophie's Tormentor breeding. Vive La France's Darling Son is out of Vive La France, the first cow to make over 1000 lbs. fat and the cow whose average of 890 lbs. butterfat for first 6 lactation periods exceeds that of any other dairy cow. He is sired by Darling's Gallant Boy, the silver medal sire and full brother to Darling Jolly Lassie, 1141 lbs. fat as Jr. four-year-old. Two of these bull calves are out of granddaughters of Sophie's Agnes, the first Jersey cow to make 1000 lbs. butterfat.

With This End in View

— No Cow Compares With the Ayrshire

FOR the Ayrshire has a certain style and beauty all her own. Strength and freedom of movement are written in every detail of her make-up. No hillside is too steep, no pasture too rough and no trail too long for the Ayrshire. The Ayrshire is always ready to meet conditions too unkind for cattle of less character.

Invest in Ayrshires now and enjoy the pleasures and profits of this sturdy breed with perfect type and heavy production.

Write for free booklets or let us help you locate a foundation.

1877 After Fifty Years of Progress — 1927

GUERNSEYS TETHERED IN PASTURE AT LES VAUXBELETS
One of the scenes awaiting those who join the Pilgrimage party of breeders, college and press representatives, and others whose friendship and livestock interest will take them on a delightful, inexpensive voyage of education and recreation.

The Guernsey Pilgrimage

WHEN eleven charter members laid the foundation for The American Guernsey Cattle Club in 1877, they built ruggedly for the future on the principle that the Club's chief function was that of service to its members and breeders.

During the last fiscal year the Club registered as many pure bred Guernseys as during the first thirty years of its existence. This remarkable figure has been reached by steady, progressive annual increases. In practically every year the number of transfers issued has increased over the previous year, which is indicative of the market activity of the breed itself. In every year the average production of the breed has been increased by about 100 pounds of milk and five pounds of butter fat.

In proper and fitting celebration of this fiftieth anniversary year, the Guernsey Pilgrimage has been conceived and planned as an appropriate means of recognizing the growth of the Club. Leaving New York on May 14th, a specially conducted party will visit England and the Channel Islands — returning arrive in New York on June 20th. Jersey as well as Guernsey will be visited, and the principal Island Shows will be held to coincide with the time of the visit. Attractive additional tours in the live stock districts of the British Isles and the Continent are also being arranged.

Address the **PILGRIMAGE SECRETARY** for details on the itinerary, estimated costs, etc.
This is the opportunity of a lifetime. Write or wire today!

8 Grove St. **The American Guernsey Cattle Club** PETERBORO N. H.

REGISTERED GUERNSEY HERD
Offered At Private Sale !

Having decided to sell Oakwood Farms in small tracts, I am offering for sale my entire herd of Pure-bred Guernseys which was started in 1910 with three Foundation Cows purchased from W. W. Marsh of Waterloo, Iowa. My herd consists of 45 head of females and 10 males, mostly young, and in splendid condition.

My last two Herd Bulls were sons of Prince Cherub and Eminent of Sarnia. If interested in purchase of one or more Guernseys from a clean herd, it will pay you to write me for list with full description and prices.

L. S. MEYER Route 8, Springfield, Missouri

High Grade Dairy Cows

The Chicago Dairy Cow Exchange is offering at private sale high class dairy cows, mostly Guernseys and Holsteins. Most of them are fresh or springers. These cows come direct from herds in accredited counties, from accredited herds, or herds that have passed at least one clean test.

When you are in the market for healthy, profit producing, cows, come to the "Exchange." Write us today for complete information.

January, 1926—2,187 lbs. Milk—ONE TON
Our present sales list carries equally good ones.

BROOKMEAD FARM, 526 Land Title Bldg., PHILADELPHIA

New Vermont Guernsey Champion

Recently the Vermont State record for the production of milk and fat by a Guernsey cow was increased by a generous margin. The winner of this honor is Helen of Phillips Farm, a four-year-old Guernsey cow owned by T. Redfield Phillips. During her official record of 365 days, Helen of Phillips Farm produced 14,766 pounds milk and 786.6 pounds fat. The previous state record which has stood since 1915 was 12,399.6 pounds milk and 717.7 pounds fat by Noblesse 3d from the former Andrews herd.

By this exceptional record Helen becomes Vermont's Guernsey Queen and also leader in her own Class C (cows 4—4½ years of age) in the Guernsey Advanced Registry in Vermont. She was already champion in Class G by reason of her record made in yearling form: 10,972 pounds milk and 613.5 pounds fat. This record stands fourth in the Guernsey breed for that age.—The American Guernsey Cattle Club.

Canadian Holstein Affairs

HOARD'S DAIRYMAN:—Canadian olstein-Friesian breeders adopted system of Advanced Registry for emales at their annual meeting in oronto in February, and added a ecial class to their Advanced Regtry for bulls.

As with the bulls it is optional hether a breeder enters his animals r Advanced Registry or not. Those ntered will be graded into five classs in the case of females, the first ree based entirely on the confoation of the animal and her score each of the main divisions of the olstein-Friesian scale of points. The st two classes known as "Excellent" d "Gold Medal" require the cow or ifer to score 75 to 85 or over 85, spectively, in the scale of points d in addition to have a record of) per cent above the standard for alification in the regular divisions the Record of Performance or cord of Merit, or 33⅓ per cent ove the standard in the twice-a-day lking divisions of the Record of rformance.

The new class adopted for bulls d known as the "Extra" class reires that a bull must at least quali in the class that has been in effect r over a year, and in addition must ve at least sixty per cent of his ughters available for inspection aded as "Excellent" in the Adnced Registry for females, the six- per cent provision to apply only ter he has at least 10 daughters so alified.

An arbitration board is provided r those dissatisfied with the decins of the association's inspectors t no appeal has yet been made to s board from the decisions with spect to bulls.

The association passed without a senting vote an appropriation of 0,000 for extension work during coming year, an increase of $5,-0 from the year just passed. Three manent fieldmen will be employed, only association in Canada with large a staff engaged in this work.

It was a particularly good year for association last year financially they were able to pay off a mortge of about $10,000 on their head ce building and invest another),000 in stocks. Registrations toled 18,625, the largest for any ar in the history of the association d 2,625 more than last year. Transs numbered 18,090, an increase of 43 over 1925. There was a growth membership of 422 compared with the year before.

A special trophy was offered for petition at the Royal Winter Fair t year for the best provincial or te herd, the herd to consist of six mals; a bull two years old or over; ull under two years; two females ee years old or over; a two-year- heifer; and a yearling heifer. This s hoped will stimulate a competi- both from Canadian and Ameri- herds.

HOLSTEINS

MICHIGAN

Pure-bred Holstein Herd DISPERSAL

At the farm of the owner, E. L. Salisbury

SHEPHERD, MICH., APRIL 6

42 Registered Guaranteed HOLSTEINS

THIS HERD is pronounced by good judges one of the best of its size in the state.

EVERY ANIMAL was bred and raised on the farm except the herd sire (who is in the sale with 25 daughters).

A YEARLY AVERAGE OF NEARLY 11,000 LBS. for the 16 milkers (all heifers but 4) indicates the quality of the dairy.

A 31-LB COW with 3 daughters and 2 granddaughters, also 28-lb. and 29-lb. cows with daughters and granddaughters are in the sale.

DESIRABLE CALF-CLUB MATERIAL is represented by a dozen heifers from 7 to 20 months—extra good ones.

A NEARLY 17,000-LB. YEARLY RECORD has just been finished. This is a herd of producers.

SALE OF EQUIPMENT will precede sale of cattle. The owner is retiring from farming.

FOR CATALOG or other information write Mr. Salisbury or address,—

1246-Lb. Bull For Sale!

To Avoid Inbreeding — I Offer

KING SYLVIA CAR BORN 355610

A son of Echo King Sylvia 267292, who is by King Valdessa Pontiac (6 daughters above 30 lbs.) and out of May Echo Sylvia, the world famous milk producer. Dam, Echo-Sylv Car Born 528386, Pennsylvania's champion milk producer with a yearly record of 31,970 lbs. milk and 1,246.12 lbs. butter. A splendid straight bull, born Aug. 20, 1921. His offspring are showing up fine, both those in my herd and in the Bell herd at Coraopolis. Write for further details.

R. W. EMRICK, Homestead Park, Penna.

KING PIETERTJE JEWEL ONA WAYNE

A son of the Grand Champion King Pietertje Jewel Korndyke from a dam that completed the world's record six-generation group. His first six dams in direct line have records averaging over 900 lbs. butter including his dam's record as a two-year-old for only 269 days and carrying calf 227 days. His 16 nearest tested dams average over 1,000 lbs. Born August, 1925. Ready for heavy service.

THESE TWO FULL SISTERS WERE UNBEATEN THROUGHOUT AN 8000 MILE CIRCUIT

Including The National Dairy Show, Pacific International, Wisconsin, Illinois, Kentucky and Illinois State Fairs and the Trenton Tri-State Fair. No Other Full Sisters of the Breed have such a Show Record.

We Offer You A Herd Sire of This Combination That Has Been Thoroughly Proved Out in Our Own Herd

The cow, Tillamook Daisy Butter King De Kol (see picture above, left), and her famous sister, Tillamook Lola May De Kol (right above), are All American Champions. The highest record National Champion of any breed is Tillamook Daisy Butter King De Kol, with 32,488.4 pounds of milk containing 1246.75 pounds of butter as a 4-year-old.

Our work with this combination of breeding has brought into our herd a good sized group of outstanding animals some of which are males. Naturally this presents a rare opportunity to the man searching for a herd sire that will prove safe and profitable. We have four bulls to offer you ranging in age from six months to six years. The daughters of the oldest one in our herd are milking 100 to 106 pounds a day right now and the type of all these bulls is excellent. They represent the combination above and include other All American Champions in their pedigree. Priced from $400 to $1500.

U. S. National Blue Ribbon Sale

APRIL 26-27 — WAUKESHA, WIS.
U. S. National Spring Sale

APRIL 28-29 — WATERTOWN, WIS.
U. S. National Spring Sale (Continued)

This important series of Holstein Sales has been set ahead one day and will be held on the dates given above instead of as previously announced in the Holstein and Dairy Press.

This will be the most unusual opportunity ever offered to secure highclass Holsteins—*real seed stock*—with the desired combination of Production and Type. A few sample offerings are pictured here. In addition to these super-animals that will be in great demand as breeding stock for the more highly developed herds of the country, *there will be many that might be described as the highest class of commercial dairy cows—all registered Holsteins and proven profitable producers—the kind that will make good as a strictly dairy proposition.* Clean cattle, fully guaranteed, valuable as replacements for TB losses or as foundation animals for purebred herds.

A Sale of Wonderful Bulls

Some of the greatest young bulls in the country have been consigned, as well as several great proven sires. Many of them are from 1000-lb. dams and all of them are bulls that are bred for production and type. Some choice show bulls among the number.

HOLSTEINS

—Producers of Cash!

Holsteins stand supreme as butterfat producers. Holsteins in most instances are leaders in cow testing associations, both in individual and herd records. Under official test the important records for butterfat are all held by Holsteins. Their ability to produce butterfat, milk and calves economically, make them consistent producers of cash.

Sons and Grandsons of Dutchland Creamelle Colantha Lad

We have several excellent youngsters for sale, a very few near serviceable age. Most of them are from good record dams and many carry the blood of Grahamholm Colantha Segis Maid, world record daughter of "Dutch." Write today for sales list.

GRAHAMHOLM FARMS, D. C. Twentyman, Mgr., Rochester, Minn.

Spring

Soon Come *and Gone!*

The rich pasturage of spring stimulates sudden increased production. But its benefits do not last.

Perpetuate the Season's Gains

Spring promises too much. It stimulates increased gains for a short time only. Soon, without the proper concentrates to supplement pasture, the animals begin to draw on their own bodies for nutriment. For no animal can eat enough grass to produce lasting gain.

Later, when grass begins to get scanty or dry, the lack of sufficient concentrates is shown in the usual "summer slump" which heavy barn feeding in the fall fails to offset; dairy cows in particular cannot be brought back to normal milk flow.

Linseed Meal perpetuates the beneficial effects of pasturage. It is rich in protein. It is slightly laxative. It has certain other beneficial elements which help it make better use of other feeds. It produces that "bloom" so essential to success—either in everyday farm practice or in the show ring. And it pays the feeder as high as 100 per cent profit year after year under wide and varied conditions. It pays with *all farm animals*—and with poultry.

Let others tell you their stories of profit in feeding Linseed Meal—in the booklets described herewith. Write us for any or all of them.

CHICAGO, ILL.

"How to Speed Farm Stock to Market"

is the title of a brand new book that will prove of great value to every one who buys, feeds and sells hogs, cattle and sheep. It emphasizes the fact that skillful marketing is equally as important as skillful feeding. It shows how Linseed Meal enables the feeder to market his live stock thirty to forty days earlier than otherwise, but is primarily a book of "pointers" on the best weights, the best time and the best place to buy and sell. By all means get this book—and the others, too, if you do not already have them.

"Dollars and Cents Results"

This book written by successful dairymen, feeders and breeders—practical men who have learned by the hard knocks of experience the "100% value" of Linseed Meal.

"How To Make Money With Linseed Meal"

This book written by Prof. F. B. Morrison, author with W. A. Henry of the famous book, "Feeds and Feeding," and Director of the Wisconsin Experiment Station.

HOARD'S DAIRYMAN

A JOURNAL DEVOTED TO DAIRY FARMING

Volume 72, No. 7 Fort Atkinson, Wisconsin April 10, 1927

The Ball-Bearing *Cream Separator* is McCORMICK-DEERING!

Some of the points in
McCORMICK-DEERING
construction:

1. Ball Bearings
2. Easy Turning
3. Slow Crank Speed
4. Greater Capacity with Less Labor
5. Long Life
6. Steady Running
7. Visible Oiling System
8. Improved Oiling
9. Easy Bowl Adjustment
10. Supply Can Locked in Position
11. Spun Metal Anti-Splash Supply Can
12. Improved Tinware

Made in 5 sizes. Hand-operated or power driven.

WHEN you invest in a cream separator let one thing be your guide: *See that it has ball bearings.* In the old days the turning of the best machine was a man's work—work requiring strength and endurance, day in, day out. That day is past; the swing is all toward the easy-turning, durable, ball-bearing cream separator. In every state, in every county, the popularity of the machine equipped with ball bearings—*McCormick-Deering Primrose*—is advancing. The good news travels.

McCormick-Deering brought in this great feature, by far the greatest improvement in separator design in recent years. Any woman can turn the McCormick-Deering Primrose with the greatest ease—the children can turn it easily too. Friction in the cream separator for the first time is reduced close to the vanishing point. And ball bearings *keep* the machine that way—plain bearings can never be so satisfactory.

Light-running durability is in keeping with McCormick-Deering quality and efficiency throughout. Years of steady service in every community testify to clean skimming, sanitation, easy cleaning, and a faultless splash lubrication system (positive, automatic, to every moving part). This machine comes to you to earn the money that pays for it—our 12 months' payment plan will help. Don't fail to have the McCormick-Deering Ball-Bearing Cream Separator demonstrated. And compare it with others. Sold by the McCormick-Deering dealer in your town.

THE *Ball-Bearing* McCORMICK-DEERING MAKES CHILD'S PLAY OF A MAN'S JOB

Polarine

THE PERFECT MOTOR OIL

is a Money-Saver!

POLARINE saves machinery—repair bills—*money*. Polarine lubricates an engine completely and thoroughly. It reaches the most remote frictional surfaces. It covers every fast moving part with a protective film of oil. It stays on the job!

Polarine means life to a tractor—a longer life and a smoother life. A tractor lubricated with Polarine works away powerfully—steadily—without interruption.

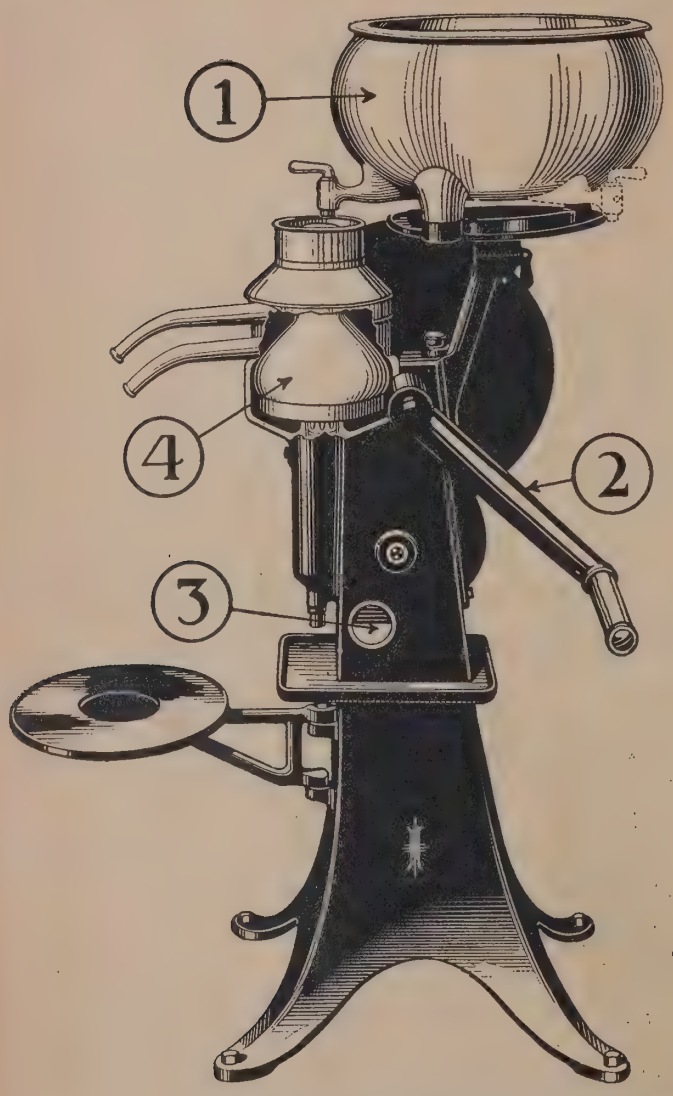
Polarine keeps a tractor in good condition—always ready when you need it. Tractor power is more dependable than man power—*if you take good care of your tractor.*

The engine of a tractor is a complicated mechanism that must have proper oil protection. Polarine provides it!

Polarine is one of the major products of the Standard Oil Company (Indiana). There are different grades of Polarine especially made for different types of tractors. One of these grades is exactly right for *your* tractor.

Polarine was produced by careful scientific work. Men of long experience and training in the Standard Oil Company (Indiana) studied farm lubricating problems *on the farm.* They developed an oil to meet *farm needs.*

Polarine is the result—an oil which gives maximum lubricating efficiency at a minimum cost. Polarine is a money-saver.



To get Best Results—change your motor oil at frequent intervals.
For correct grade consult chart at Any Standard Oil Service Station.

Announcing!

The NEW 1927 SERIES DE LAVAL SEPARATORS

Ask your agent to show you a new De Laval. Try one side-by-side with any other machine. Not one in a hundred who does so fails to choose the De Laval. Sold on easy terms. Trade allowances made on old separators.

THESE brand-new De Laval Separators are **now** on displa by De Laval Agents. We invite all cream separator user to see and try them, for we are confident all who do so will agre that they are the best cream separators ever made. They ar the crowning achievement in nearly 50 years of separator manu facture and leadership. **New** features are:

1. Turnable Supply Can. The supply can may be turn ed so that tinware and bowl may be put in place or remove without lifting the supply can from its position on the separa tor. Every user will like this feature.

2. Easier Turning. For three years the De Laval exper imental and engineering departments have been conducting ex tensive tests, to develop still easier turning separators. The re sults of these tests are embodied in this new series, which bot start and turn easier than any other machines of even les capacities.

3. Oil Window. The new oil window enables you to se at all times the level and condition of the oil. It shows at glance whether or not the separator is being properly oiled.

4. Floating Bowl. All new De Lavals have the wonderfu "floating bowl," now used in De Laval Separators with suc wonderful results. It is self-balancing, runs smoothly withou vibration, with the least power and wear, skims cleaner an delivers a richer, smoother cream.

BOVINE TUBERCULOSIS IN HUMANS

DR. C. H. LOCHEAD, Mayo Hospital, Minnesota

UBERCULOSIS in cows is a cause of tuberculosis in humans. It is necessary to rete that because there are still le, some of them pseudo-scienwho deny it. And also while it old story to all of us and all le generally have been told it y times, human nature is prone rget.

om every part of the world rets have come to us within the few months for facts conng the danger of milk tuberculous cattle. In places hearings are being on the protests of milk ucers or milk distributors nst the laws passed for the ction of human health; from the large number of s from which requests for mation have come one t be led to suspect that propaganda was being ed on to lower the bars nst tuberculous milch cows, pite of the fact that even the economic standpoint rculosis in cattle is a ge to our stock raisers, irective of its influence on an health.

e danger of bovine tuberis to man was greatly exrated by well-meaning but enthusiastic workers; and ty-five years ago, just t the time when people becoming accustomed to new idea, like a thunderout of a clear sky came the ouncement by the great that tuberculosis in cows not cause tuberculosis in ans.

The Answer to Koch

eat and all as Koch was in e tuberculosis world, his ments were questioned and ually from all over the l came contradictory statens and evidence to dispute mpressions, even from his land, Germany. The Ger- government had appointed mission to study the ques- which reported that 25 per cent e cases in children studied by had derived their infection from e sources.

e British government also aped a commission to inquire into elationship, if any, between boand human tuberculosis. After ing the question for nine years, reported unanimously that, the germs are not exactly alike, germ can and does cause disin the other animal and that botuberculosis spreads to man gh infected milk and meat.

ch was answered by work done e state live stock sanitary board nnsylvania. Evidence was also ced by the Bureau of Animal Industry in Washington, by the New York City laboratory; and as time has gone on, each year has brought word from many sources opposing Koch's impressions.

Some of the most brilliant and conclusive work to prove the error of Koch's statements was done by Fraser and Stiles. These observers had under their care many cases of surgical tuberculosis in children in the Royal Edinburgh Hospital for sick children. Fraser very carefully examined the material obtained from the cases of surgical tuberculosis and determined whether it was due to the human or bovine type. He proved that 62 per cent of a series of definite bone and joint tuberculosis owed their origin to the bovine type of bacillus.

An excellent summary has been made by Rosenau who reports that out of 2,527 cases of tuberculosis studied by several observers, 16.2 per cent were bovine. In people over 16 years there were 2.9 per cent bovine; between 5 and 16 years 28.9 per cent; and under five, 32.4 per cent. There were 1,079, or 42.8 per cent, pulmonary cases, of which six were bovine. There were 1,437, or 57.4 per cent, other forms of tuberculosis, of which 28 per cent were bovine.

Tuberculosis in Children

As is well known to the medical profession, pulmonary tuberculosis of bovine origin, especially among adults, is, so far as proven by any investigation, of extremely rare occurrence. In non-pulmonary tuberculosis, especially among children, however, the facts are different. Fishberg says, "Under five years of age 61 per cent of cervical tuberculous adenitis, 58 per cent of abdominal tuberculosis, and 66 per cent of generalized tuberculosis and meningitis, which may be of alimentary origin, are caused by the bovine virus." Dr. A. Stanley Griffith, of London, has in a recent series of tests tabulated 1,068 cases of tuberculosis, finding 20.7 per cent showing bacilli of the bovine type. He found the percentage to be much larger among children under ten years of age. Of 221 children less than five years old examined, 37.55 per cent showed the animal germs. Of 312 children between five and ten years old examined, 29.45 per cent showed animal rather than human germs. Of the total of 1,068 tubercular children examined, 216 showed purely bovine tubercle bacilli, 847 showed purely human tubercle bacilli, and the remainder showed bacilli of both sorts.

Studies of this subject by German and French authorities, while less recent, are no less conclusive. French tests have shown 33 per cent, and German 24 per cent of tubercular children examined, suffering from bovine infection.

Chesley of Minnesota reports, "In children 23.8 per cent of generalized tuberculosis, 40 per cent of tuberculosis of cervical glands, and 49 per cent of abdominal organs are due to infection with the bovine variety."

From such figures there can be no doubt that a considerable proportion of tuberculosis affecting children is of bovine origin, more particularly those forms involving primarily the abdominal organs and the cervical glands. Even in adolescents and adults so large a proportion of the cases investigated show the presence of bacilli of the bovine type as to inicate that the same sources of infection are possible at other periods of life than childhood. The more deeply we go into the subject, the bovine side of the question comes to take a larger place especially in connection with surgical and abdominal tuberculosis, not only in the child but also in the adult. Children, of course, are especially susceptible to the disease and as a rule the younger the child the greater is its susceptibility.

There is still some difference of opinion as to the actual danger—that is, the proportion of children who are actually infected by the bovine germ—but that it does occur is doubted by no one. It is not too much to say that there is no scientific man of any standing in any part of the world today who questions the transmissibility of bovine tuberculosis to human beings. Bovine tuberculosis is undoubtedly responsible for a large percentage of non-pulmonary tuberculosis of childhood, which means that it is also responsible for a large percentage of tuberculous cripples, and it may so materially affect the health of the children that they will be seriously handicapped throughout life.

While bovine tuberculosis disfigures, cripples, and handicaps hu-

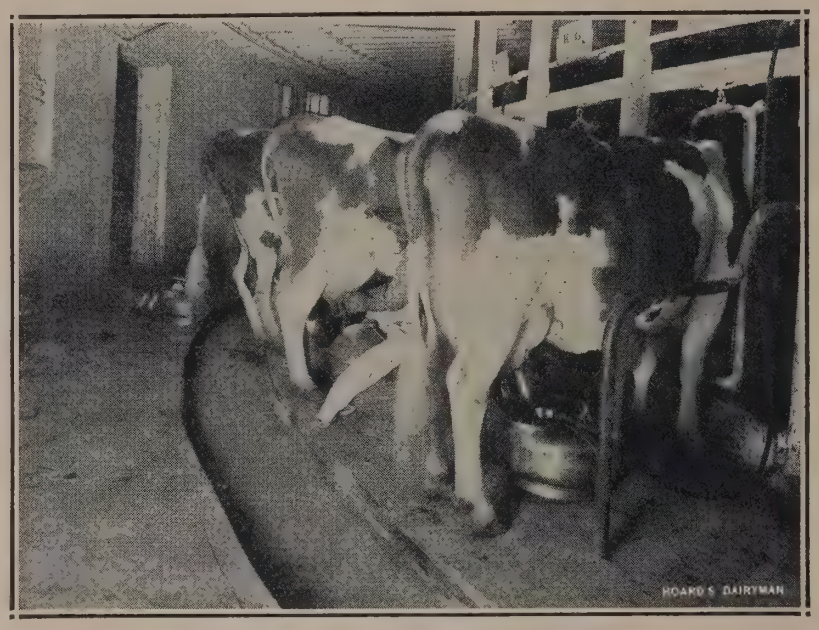
What I Am Trying To Do On My Farm

To Get Life As Well As A Living



W. J. DOUGAN, WISCONSIN

To discuss getting life on the farm, we must come to an understanding of terms. What is life—human life? It is easy to understand the life of the lower animals: enough to eat and a comfortable place to sleep. Physical comfort—this seems to be the total of life for the hog. Physical comfort is not the total of life to man. He has a complex nature; the aesthetic, social, and spiritual as well as the physical natures are to be considered.

Our problem, then, as farmers is: How to secure time, means, and equipment for the development and enjoyment of this complex life. There are some conditions, in working out this problem, peculiar to the farm.

First, the farm cannot provide unlimited wealth to satisfy our longing for beauty. We cannot move mountains, create lakes, and build villas, nor can we revel in works of art. Neither can the farmer be released from service to gratify his aesthetic tastes. The farm family must develop their higher natures in and through their work and in their surroundings. They must learn to enjoy the simple pleasures and to utilize all nature about them. The farm has many natural advantages that are free for the taking. The sweep of the landscape, the open sky, the forest and field and stream, as well as all animate life, will lend themselves to our plans.

It has always been a fixed purpose on our farm to so manage the work, secure conveniences, and develop the beautiful that we might get life on the farm as well as a living. We are trying to develop the beautiful, first, by eliminating the ugly. A rusty, rotting old farm implement under the tree in the corner of the yard, or a few loose sticks and boards scattered about will mar an otherwise desirable scene. A lopping door will make the whole building look shabby. Every farm needs a junk day occasionally; a day in which to scrap the unusable and to bury the worthless, or to get it out of sight. We try to conceal the unsightly by hedge or building, or, if possible, change its face to beauty.

MILKING TIME ON THE DOUGAN FARM

The other way we are trying to develop the beautiful is by taking advantage of natural beauties. I love wide, open yards studded with a few majestic trees. I lay out the field in order and keep the corners clear. I cherish a wild plum hedge at the end of one field, and a sumac hedge that hides the railroad across another field. There is one natural beauty that no place has a monopoly on; we all can claim our canopy of blue. I have my dwelling so placed in the home site that there is an unobstructed view of the sky from sunrise to sunset.

In the home we have an abundance of light, some inexpensive art, music and literature, and, withal, a home spirit.

I am trying to get life on the farm by conveniences to make the home work lighter and more enjoyable such as running water, bath, drain, light, airy kitchen, electric lights, electric dish-washer, etc. It reaches back to our material problems. We have always to keep in mind that the farm must pay a profit sufficient to get some of the requisites of life for the farm family.

I try to cultivate social life by bringing guests of character and culture into the home, and by mingling with my fellows in community life.

The endeavor to cultivate these higher tastes and to satisfy the higher nature reacts to ennoble the ordinary work. Some of the most exalted moments of my life have been while doing common tasks on the farm and communing with God through the natural life about, and enjoying the beauties in God's natural world.

May we farmers plan to get life on the farm and not be a King Midas, turning everything into gold.

THE HOME AND MILK HOUSE OF W. J. DOUGAN

THE BARNS AND SILO ON THE DOUGAN FARM

Decentralization of Industry Would Help Agriculture

FAR-SEEING men of every generation have issued warnings against concentration of industry and crowding people into small areas. Up to a certain extent, centralization of industry is economical, but it is the judgment of many manufacturers that it has been carried too far.

In a recent address before the National Electric Light Association, General G. E. Tripp, chairman of the Westinghouse Electric & Manufacturing Company, in part said:

"Industry in this country is over-centralized. The day of the huge manufacturing plant and the crowded industrial city is passing. The future will probably see much of our manufacturing done in small unit plants scattered throughout the rural districts. This will directly benefit the farmer in many different ways.

"The farmer must pay high prices for the things he buys," said General Tripp, "but because of these high costs he cannot sell his products with satisfactory profits in the world markets where he must meet the competition of other countries where costs are lower, and in his home market he as an individual is confronted as to the bulk of his products by highly efficient organizations whose guiding principle is to buy at the lowest price and to pass the benefits to the consumer. This is a natural and perfectly honest process, but to the farmer the picture is that most of our industries are so well organized that they are passing the heaviest burden of society on to him.

Industry's Problem

"On the other hand, consider a large industrial city which contains scores of factories and employs thousands of people. As these factories grow, congestion increases until a point is finally reached when newcomers find it impossible to obtain satisfactory homes in the city itself except at prohibitive prices, and the transportation facilities from outlying points become intolerably overcrowded. Wages, therefore, begin to increase, but without benefiting the wage earners because their expenses likewise increase.

"Under these circumstances considerable economies for both industry and wage earner can be secured by establishing relatively small unit plants in the small towns of the rural districts. Not only are new sources of labor thus opened up, but production costs can be reduced, certain managerial difficulties can be minimized, and the workers can live comfortably and more inexpensively within easy reach of the plant.

Decentralizing Now Going On

"While labor conditions form the most important factor favoring decentralization, others are also influential, such as the reduction in rent and taxes, nearness to sources of raw material, and so on. The outstanding example of the operation of these forces is the movement of the cotton mills to the rural districts of the South. California is already dotted with small industrial plants, and it is not improbable that many of the great manufactories of the Atlantic Seaboard and the Middle West will care for their growth in small unit plants, each devoted to the production of certain standardized parts.

Increasing the Farmer's Earning Capacity

"Under present conditions the farmer's family usually has no alternative between working on the farm and going to the city, which means that either the family as a unit will be uneconomically employed, for the

HOW EUROPE FARMS

A Holland Dairy Farmer

HERBERT R. COX, NEW JERSEY

MR. BOER STANDING ON THE HIGHWAY IN FRONT OF HIS HOME
There is a canal between the road and the house.

IMAGINE, if you can, a dairy farm which is eight feet below sea level, entirely and permanently in grass, worth $650 an acre. This is the case of a farm which I visited this summer and which is not a freak farm. It is typical of the intensive dairy section of the province of South Holland in the neighborhood of The Hague, Leyden, and Utrecht.

The farmer's name is Willem Boer of Bodegraven, and he owns and operates 69 acres of land surrounded and bisected by ditches and canals. Most of his land is only about a foot above the level of the water in the ditches but some of it is a little higher. It must be understood that about 40 per cent of the Kingdom of Holland—the western part bordering the North Sea and the Zuider Zee—lies not more than three feet above mean sea level and would be inundated if the sea broke through the barrier of dunes and dykes. Some of this land is as much as sixteen feet below sea level, the water being removed by several series of pumps at different levels.

Mr. Boer converts his milk into cheese. It would be more proper to say that Mrs. Boer does this, since she has charge of the cheese manufacturing on the farm. The kind of cheese made is Gouda, a 45 per cent full cream cheese, one of the varieties which has made Holland famous. This cheese is sold under close government inspection and every piece made must bear a serial number so that it may be easily traced to its source in case it falls below the percentage of butterfat or is deficient in other respects. At the time of my visit this farm was producing four cheeses a day of 35 pounds each. The cheese is kept at home to ripen for a period of four weeks before it is taken to the cheese market at the village of Bodegraven.

If you stand off and take a general view of this farm you will note that it is typically Dutch. Beyond it in all directions extend similar acres of absolutely level land in grass with windmills dotted here and there and with scattered trees along the canal and ditch banks. Mr. Boer's home is a large brick structure with a high, steep tile roof. In one corner of the farm is a small orchard of apple trees under indifferent care. The farmers here are dairy specialists and have no time for anything else.

The machines that produce the milk on this farm are 39 head of cows. There are also 15 head of one-year-olds, 2 head not in calf two years old, 16 calves, and 1 bull; a total of 73 head, all registered Friesian Holsteins and as nice a looking herd as you will see in many a day. We might add that this farm also carries 70 sheep, 120 hogs, 20 chickens, and 2 horses. When we state that the Boers have five children, all youngsters, we have completed the census of the farm.

The general scheme of management is rather simple. The cattle and sheep are fed on the grass, both pasture and hay, together with purchased concentrates. The whey from the cheese making is fed to the hogs. It is a system that is quite general in this part of Holland. To get all the work done on this farm requires the services of

A FEW OF THE 73 PURE-BRED FRIESIANS, AS HOLSTEINS ARE CALLED IN HOLLAND

THIS FARM IS EIGHT FEET BELOW THE SEA AND IS AS LEVEL AS A FLOOR

A GOUDA CHEESE MADE ON THIS DUTCH DAIRY FARM

Mr. and Mrs. Boer, three men t year round hired by the day, and house servant who helps with t milking.

About 24 of the 69 acres are cut f hay every year. After haying, t aftermath is pastured. The manu produced, of which there is a lar quantity, goes on the grass. Litt else is needed to fertilize the land, b Mr. Boer usually applies about 5 to of a complete fertilizer every yea most of it to the area to be cut f hay.

Mr. Boer is a true cow man. Stan ing nearly six feet high in his wood shoes, he took me to t pasture where the co were being milked. G ing from one to anoth he would state the pr duction of each and gi her pedigree for gener tions back, all with t gleam of the enthusia in his eye. It was rath difficult for me to foll him here even with t aid of a very efficie interpreter.

The hogs constitute important source of re enue on the farm. T pigs are not raised b are purchased wh young and sold wh

(Continued on page 421)

A SEVERE WINTER ON CLOVER SEEDINGS

Dairy Farmers Should Try Soy Beans

R. A. MOORE, WISCONSIN

REPORTS are coming to the college of the killing of clover from many portions of the state. The freezing and thawing weather during the middle of the season and this spring has had a very detrimental effect especially upon clover fields where the snow had been blown off, and many farmers will be disappointed this year in finding that although they had a fairly good stand of clover last fall, it has winter-killed severely. The dairy farmers of Wisconsin rank among our best clover growers and it is nothing short of a calamity for them to lose their leguminous hay.

Those who do not have alfalfa fields should immediately begin thinking about getting a crop put in for leguminous hay as they cannot afford to be without it. No crop fits into this place better than the soy bean. Soy beans are becoming grown generally throughout Wisconsin as a hay making crop. Soy beans, when cut and cured properly, make a grade of hay that is even more nutritious than clover hays and ranks almost equal with alfalfa.

The following varieties are used from north to south in the state: Manchu, Black Eyebrow, and Ito San in the southern half of the state and Pedigreed Blacks and Mandarins for the northern part of the state.

Method of Planting Soy Beans

When the farmer feels that his stand of clover is so damaged that it will not pay for him to grow it, he should immediately plow his field, prepare it nicely, and plant his soy beans about corn planting time. The planting can immediately follow corn planting to very good advantage as there is no real object in getting the soy beans into the ground before the soil has lost its winter chill. Spring plow land, roll quite heavily; clay should be planked or corrugated roller run over the same so as to firm the soil. Soy beans can be planted with corn planter, or with a regular grain drill. When drilled in rows, from twenty-four to thirty inches apart, between the rows one can use the regular grain drill, stopping up the intervening holes so that the beans will drop the desired distance. When beans are put in twenty-eight or thirty inches apart between the drill rows and dropped about two inches apart in the row, one bushel of soy beans will plant two acres.

Soy beans are then cultivated the same as corn and they grow so rapidly that the broad leaves spread out over the rows and the field looks almost as if it were a solid field of beans. Level cultivation is practiced so that the mower can be run over the land. Soy beans should be cut just after the little beans are beginning to develop. The stand is then in the best possible condition to make into hay. Many farmers have made the sad mistake of cutting soy beans too late in the season as the soy bean stems become woody and the pods had fully developed beans in them.

The soy bean is not so very different than any other legume and we know that clovers and alfalfa and many of our other legumes are cut when in full bloom. The soy bean is just a little past the blossoming stage when it can be cut to the best possible advantage.

Another factor that prompts us cut the soy beans somewhat earli than has been advocated in the pa is that the bean, in order to cu properly for hay, must be cut in go hay curing weather. Where farme have left soy beans until the pods a all filled out, it took them way in the latter part of September wh the nights were cool and the da were beginning to become short a the hay could not be made in t best possible way. Soy beans usua reach the proper stage for maki hay the latter part of August or fi week in September. It is then ni and warm and the hay can be cut a made just as readily as clover hay.

Another method of planting s beans is to let them run the regul width of the grain drill. This may six, seven, eight, or nine inches whatever it happens to be on t grain drill that the farmer happens have. Beans are dropped about fo inches apart in the drill row. usually takes about a bushel a three pecks to two bushels of s bean seed to plant an acre when p in in that way. Many prefer putti them in broadcast rather than putti them in the thirty-inch drill row,

(Continued on page 422)

THE L. P. BAILEY COMPANY

The Story of a Family That Pulled Together and Built a Successful Business on Quality Products

SOME folks chase rainbows all their lives looking for pots of gold but Mr. and Mrs. L. P. Bailey of Belmont County, Ohio, nailed down the end of a rainbow and dug out a pot of gold at the end of it.

The L. P. Bailey Company which now represents the material pot of gold dug out by this hardy, pioneer couple is a unique institution in affairs among American farmers. It represents a desire on the part of parents to keep their children near them; it also is a means whereby members of the Bailey family may invest themselves and their savings at home in a regular incorporated business if they so desire.

The business of this concern is to produce high quality foods and sell them direct to consumers or to them through retail grocery stores. The chief foods produced are Jersey butter, Hampshire pork products, cottage cheese, buttermilk, eggs, dressed poultry, and vegetables.

Let us go back over half a century to the time when Mr. and Mrs. Bailey began nailing down the end of the rainbow and follow the story through.

In 1871, when L. P. Bailey was 21 years old, he married Elizabeth Stanton who was 24 years old. Both were born and reared in Belmont County. Love was just as blind then as it is now for the groom had to and did borrow $65 with which to give his bride a glorious wedding trip. At the end of a week they returned. Their beginning cash capital was less than nothing but their faith in each other and in what the future held for them knew no bounds.

In 1872 they rented a farm of 70 acres for $150 cash rent. In 1873 they bought a farm of 115 acres and paid $7,500 cash for it, though nearly all the cash belonged to farmers for which the borrowers agreed to pay 8 and 9 per cent interest. In the next 6 years they learned something about the abuse of credit and they also learned that a farmer's suspicions are easily aroused, especially if he has loaned one money. It was a battle to keep the money lenders satisfied.

At the end of 6 years an opportunity came to sell 50 acres of the land, including the buildings, for $100 an acre cash. They sold, they paid up their debts, but had no place to live.

They rented again, this time tacking 240 acres for an annual cash rent of $400 on a 5-year contract. The land was very thin and the buildings poor on this farm. The owner would do nothing to improve these conditions. With his own hands and the help of one hired man, Mr. Bailey built a pole stable large enough to house 28 cows. He put in stanchions and made a gutter behind the cows; he made a loft overhead for hay and bedding. They stayed on this farm 5 years and when they left, the owner, though he may have realized the value of a good tenant, gave Mr. Bailey no compensation for improving his property.

The previous experience in farm ownership told them they were not ready to buy a farm. They rented again for two years and then bought the farm they were on. A deciding factor in buying this farm was a barn very much to the liking of Mr. Bailey who had, about this time, learned to appreciate the dairy cow. This barn, while not built to house dairy cattle, could be converted handily to serve this purpose. It was the talk of the countryside when built. This farm is now the home of The L. P. Bailey Company.

THE L. P. BAILEY FAMILY

Top row, left to right: J. S. Bailey and wife, Lydia M.; Fred R. Bundy and wife, Clara (Bailey) Bundy; O. J. Bailey; Laura E. and Alva C. Bailey. Bottom row, left to right: Clarence R. Patten and wife, Anna (Bailey) Patten; L. P. Bailey and wife, Elizabeth Stanton Bailey; Lillian M. Bailey and husband, E. M. Bailey.

Mr. Bailey became interested in the dairy cow more through the persuasion of his wife than by any choice of his own. During the time they were moving about from one farm to another and paying cash rent, Mr. Bailey found it necessary to supplement the farm income. In 1878 he became the owner of a threshing machine and operated it successfully for 2 years after which he traded it for a pure-bred Jersey bull, a cow, and a heifer. Mrs. Bailey had also been supplementing the cash income and she finally convinced her husband that her way was best. She liked cows and from two common ones had been making butter. It was such good butter that it soon created a demand beyond the supply. In 1881—ten years after they were married—the first print butter that entered the Pittsburg market was from Mrs. Bailey's churn. It sold as "Bailey's Best" for 35 cents a pound on yearly contract. The Jersey cows were just what she wanted.

By accident Mr. Bailey got some grade Jerseys. Needless to say that this also pleased his wife. She continued to make more "Bailey's Best" butter. Her husband became interested in pure-breds. In fact he had become quite fully convinced that the dairy cow offered greater possibilities than running a threshing machine. Furthermore, he became convinced his wife could make good butter.

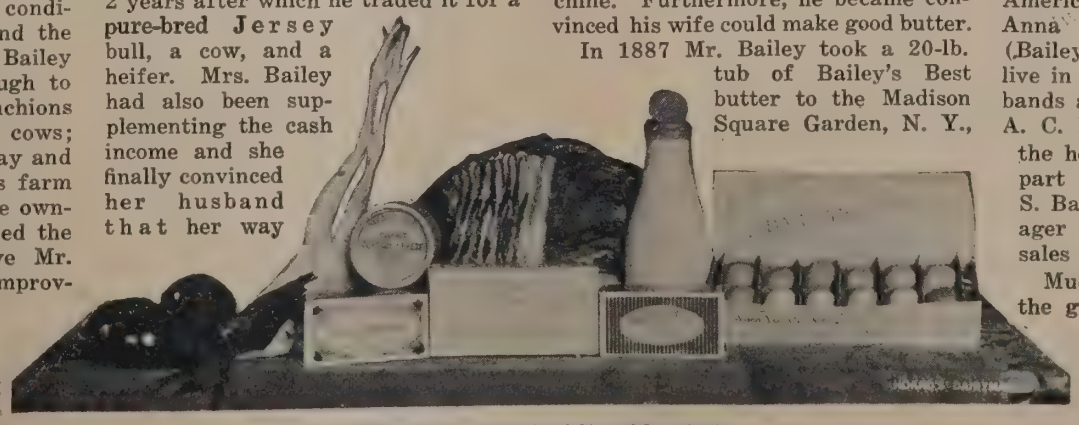
In 1887 Mr. Bailey took a 20-lb. tub of Bailey's Best butter to the Madison Square Garden, N. Y., Dairy Exposition. There were 200 entries in the class. He stayed 5 days asking questions all the while but not once saying he was an exhibitor. The Bailey entry won third and a cash prize of $30 which amount was duplicated by the Vermont Farm Machinery Company because Mrs. Bailey had used a Cooley Creamer manufactured by this company.

Since then many samples of milk, cream, and butter have been entered in national competition. It is said that this farm has won more prizes on dairy products at national and state dairy shows than any farm in the United States. For example, in 1914 a sample of cream won second place at San Francisco in a class of 2,500 entries. At the National Dairy Show held at Columbus, O., in 1917, a sample of cream scored 98.5 and had a bacterial count of 100 per c. c.

Mr. and Mrs. Bailey have not built this splendid business alone. Four sons and two daughters have all had a part in the development. The business has been built on the principle of producing a product just a little better than any one else was producing it. The family members have all pulled together. With team work and quality products the business has prospered.

Like all parents Mr. and Mrs. Bailey desired to keep their children near them. To do this a company was incorporated in 1924 and capitalized for $150,000. The paid up capital is now $80,000. The stock is all owned by members of the Bailey family.

At the time of incorporation Mr. Bailey gave each of his six children $500 and each of his 24 grandchildren $100 in stock certificates of the company. The oldest son, E. M. Bailey, put in $17,000 in the stock to help finance the business though he is not actively engaged in it. He is retained on the board of directors, however, for his wise counsel in business affairs.



The oldest son, E. M. Bailey, is a milk distributor and manufacturer of ice cream in Pittsburg. Besides this he is president of the American Dairy Federation, president of the Pittsburg Dairy Council, and vice-president of the National Dairy Products Company. The second son, O. J. Bailey, owns and operates a farm near the company farm. He spends considerable of his time in local and state farm bureau affairs, representing his state as a voting delegate at the last annual meeting of the American Farm Bureau Federation. Anna (Bailey) Patten and Clara (Bailey) Bundy, the two daughters, live in the community and their husbands are on the board of directors. A. C. Bailey is general manager of the home farm or of the producing part of the company's business. J. S. Bailey, the youngest son, is manager of the manufacturing and sales part of the business.

Much of the work is now done by the grandchildren of Mr. and Mrs. L. P. Bailey. They receive wages and may buy stock when they have saved money to do so. While it is made

"BAILEY'S BEST" FOOD PRODUCTS

If you want extra traction and long tread wear in addition to balloon tire comfort, be sure you get this quiet-running *new-type* Goodyear All-Weather Tread

Costly NOT to Have

When it comes to the lowest possible mileage cost, a good tire is only half the battle.

The other half is the *service* performed for you by your local Goodyear dealer.

He makes sure the tire you buy is the right size and type for your car. He mounts it on the rim for you. He fills it with air.

During the whole life of that tire he is pledged to help you give it the care it should have to deliver the maximum results.

This service cuts down your tire bills. It saves you money. It is something mighty costly *not* to have.

It is part and parcel of the Goodyear policy: *to build the greatest possible value into Goodyear products,* and *to provide facilities so that the user can get all this inbuilt value out.*

Goodyear makes a tire to suit *you*—whether you want the incomparable All-Weather Tread Goodyear, the most famous tire in the world, or the lower-priced Goodyear standard quality Pathfinder

The Silo and the Corn Borer

HOW the silo can be used to combat the European corn borer, analyzing the cost of producing silage, and methods of reducing the cost of filling a silo were discussed at the National Silo Conference at Chicago on November 30 and December 1, 1926.

Its value as a means of fighting the corn borer and the work done by the federal government in eradicating the pest were discussed by L. H. Worthley of the U. S. Department of Agriculture.

The pest's life history is roughly as follows: During the winter it is in a worm stage. About April 15 it becomes active and in May it enters the pupal stage. About July 7, it becomes a moth, when it lays eggs. (Each moth lays approximately 350.) The eggs then hatch into worms which feed on the leaves and the tassels of corn, and then eat their way into the stalk under the tassel. They continue working downward until the second frost, when they are within one or two inches of the ground.

If the stalks are left in the field, the farmer provides winter quarters for the worm. The most practicable way for him to fight this menace, if it is a local evil, is to cut his cornstalks an inch or two above the ground and to make ensilage of them. The resulting fermentation kills these worms and thereby helps destroy the pest.

During the discussion, Dean G. I. Christie of Purdue University said, "The borer can be eliminated. If it multiplies, it will increase the cost of growing corn from 10 to 15 cents a bushel."

Regarding filling costs: Professor F. W. Duffee of the University of Wisconsin stated that the average filling cost on 282 farms in Southeast Wisconsin was $2.06 per ton. This figure represents approximately 40 per cent of the cost of silage, and includes such items as silo depreciation and repairs, ensilage cutter depreciation, and interest on silo and equipment.

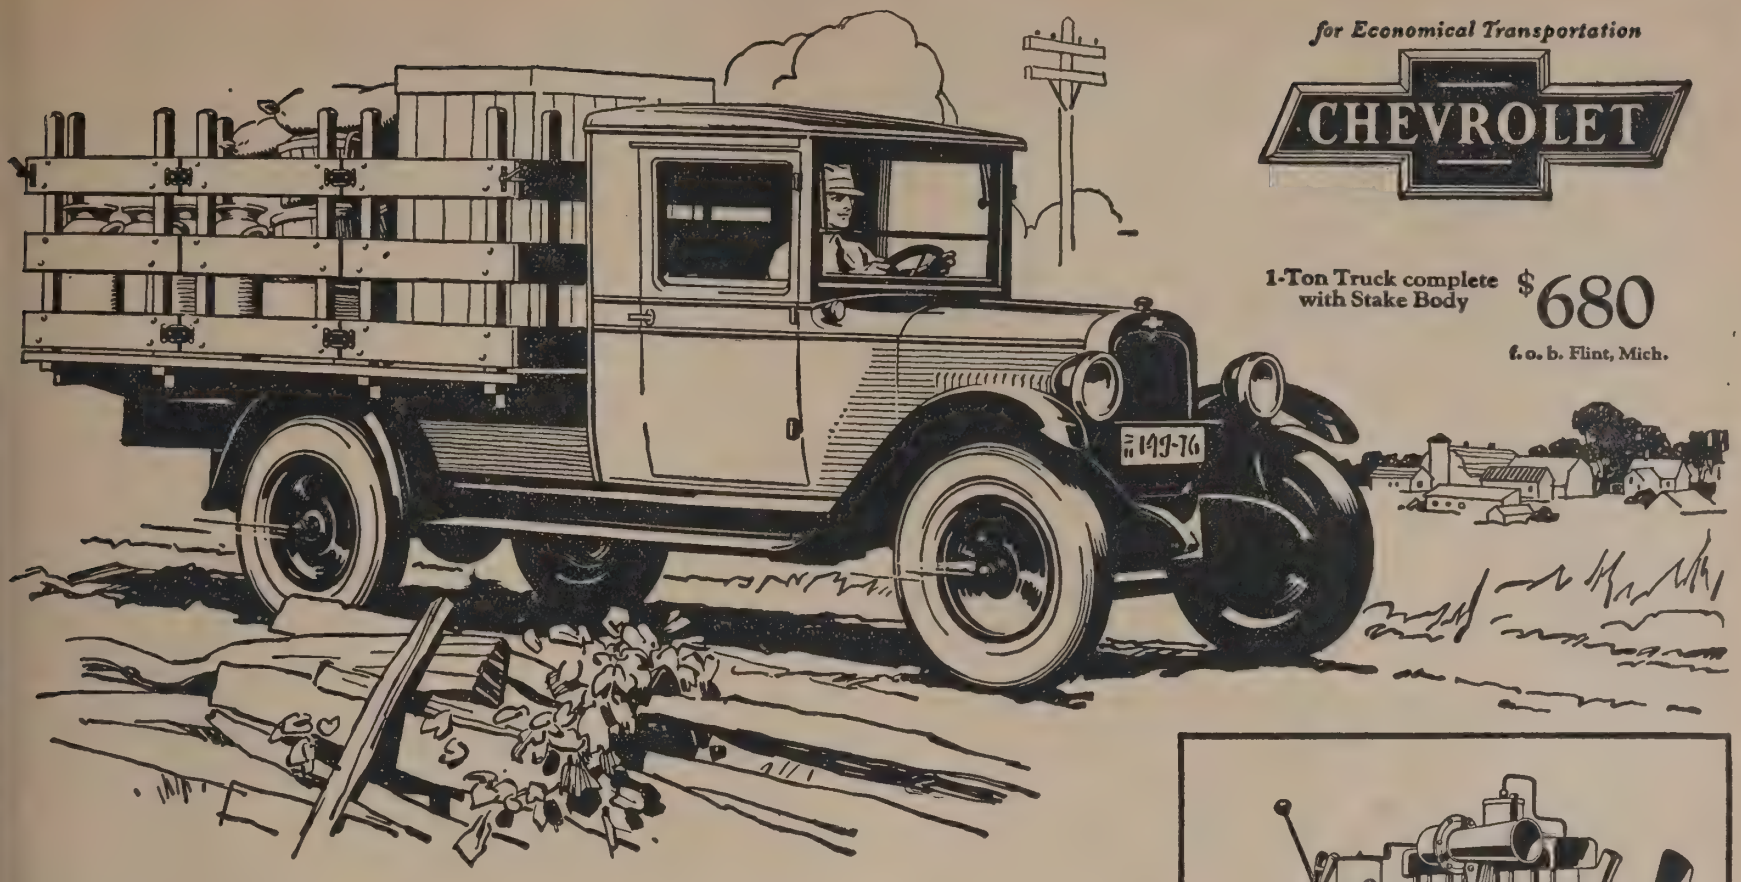
Of this cost, 58 cents went for man labor and 46 for machinery. Both these items showed wide variation on the farms studied. Man labor had a low cost of 27 cents and a high of 9[illegible] cents, while machinery charges ran from 31 to 88 cents.

One step recommended by Professor Duffee to lower costs is the building of larger silos, since the number of men on a crew is usually the same on all sized silos. A 150-ton silo he says, is usually filled at a cost of 50 cents per ton less than a 60-ton silo. By building the silo from four to six feet higher, it will not be necessary to have a man inside to pack down the ensilage, since if the taller one is filled to the top, the packing can be taken care of by natural settling without reduction in capacity. By this simple method the cost of one man's labor is eliminated.

On the farms from which the cost of filling silos was studied, it was found that 10.6 per cent of the total expense went for silo depreciation and repairs. As this was an average, it is probable that this figure varied greatly between farms. In other words, the item of repairs and depreciation may be a highly important one, or it may be minimized. Sound construction with good materials will materially decrease the depreciation rate and minimize the repair bills.

It is very often possible, he declared, to cut down the number of men on the machine. A skillful planning of the work often makes a saving possible here. Another method of saving which he suggested consisted in having a slanted feed table for the cutter so that the corn could slide down by the action of gravity.

The conference led to the specific value of ensilage. While no single feed is in itself all-sufficient, ensilage should form a part of all balanced rations. Roughly, there are six major considerations in selecting feed: Economy, balance, succulence, palatability, bulk, and variety. Ensilage ranks high in economy, succulence, palatability, and bulk. It saves 40 per cent of the corn crop that would otherwise be lost in the field. Through manure, it returns many of the natural elements of the soil.



STATUE TO A GUERNSEY COW

A creamery company in Los Angeles has just completed this large life size statue of a cow which has been set up on a prominent highway entering the city. The statue is primarily for advertising pure certified milk and also to create a wider use of milk. The sculptor used a real cow for a model in his studio while preparing the original of this statue. Other statues will be erected along the important highways of the district. At last the faithful cow will have a statue in her honor and thousands of people will remember that life would be very much hampered without bossy to furnish them with their daily supply of milk.—WILLARD D. MORGAN.

for Economical Transportation

CHEVROLET

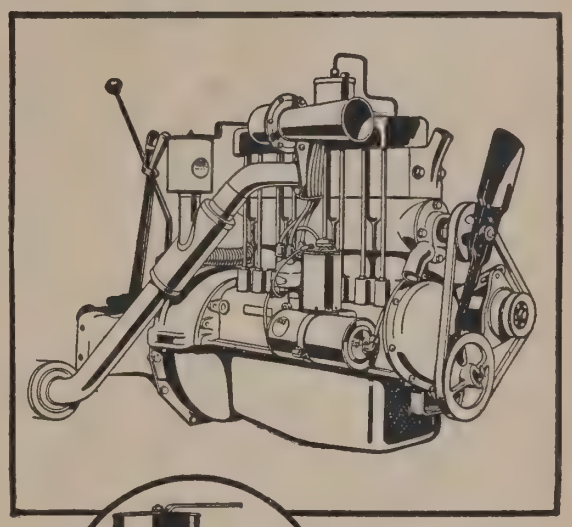
1-Ton Truck complete with Stake Body $680 f. o. b. Flint, Mich.

Quality Features of the world's most popular gear-shift truck!

Chevrolet is the world's most popular gear-shift truck because it offers, at amazingly low prices, scores of quality features not found on any other haulage unit in the low price field.

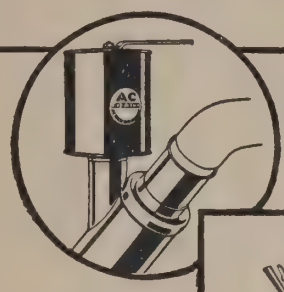
These all contribute to the modern design which has made Chevrolet Trucks famous the world over for dependable, economical transportation, slow depreciation, handling ease and driving comfort. Included in the list are numerous recent mechanical improvements of the utmost importance, such as—AC oil filter and AC air cleaner to protect the motor from excessive wear and to maintain at its peak efficiency the smooth, effortless power for which Chevrolet's motor has long been famous.

Other new features are an improved transmission and new gear-shift lever; a new and more conveniently located emergency brake; crowned fenders; a new radiator of greater cooling capacity; a new 17-inch steering wheel —and even bullet-type headlamps have been added to give a distinctive touch of smartness.



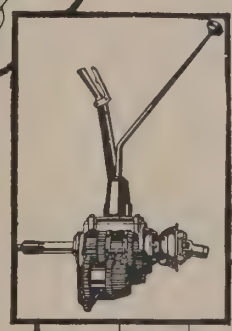
These are but a few of the many new quality features offered you in Chevrolet Trucks—in addition to the 6-inch channel steel frame, super-rugged rear axle, oversize brakes, semi-elliptic springs set parallel to the load, and numerous other examples of truck-type construction that long ago swept Chevrolet to unrivalled sales leadership in the field of gear-shift trucks.

If you want the utmost in commercial transportation combined with true economy, see the nearest Chevrolet dealer. Have him show you why Chevrolet Trucks have been the choice of so many thousands of buyers—from men who operate only a single unit, to large companies which maintain huge fleets. Have him give you a trial load demonstration—*have him prove the advantages of buying a Chevrolet Truck!*

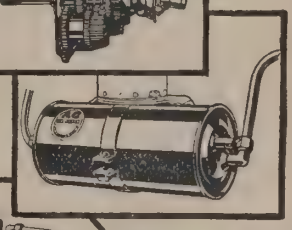


CHEVROLET MOTOR COMPANY, DETROIT, MICH. *Division of General Motors Corporation*

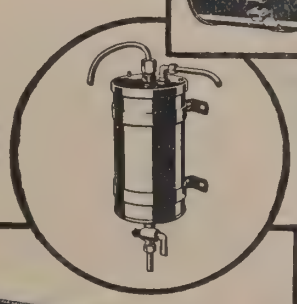
1-Ton Truck Stake Body $680	1-Ton Truck Panel Body $755	1-Ton Truck Cab and Chassis $610
1-Ton Truck Chassis $495	½-Ton Truck Chassis $395	*All prices f. o. b. Flint, Mich.*



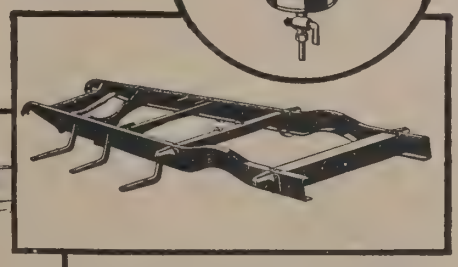
In addition to these low prices, Chevrolet's delivered prices include the lowest handling and financing charges available.



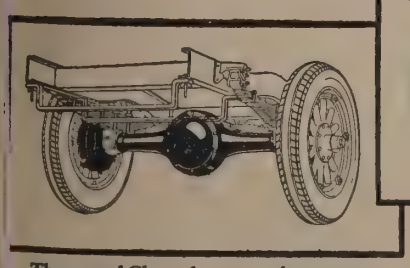
The Famous Chevrolet valve-in-head motor has been made even more dependable--with even greater operating economy.



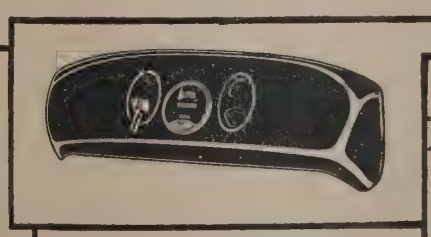
A new AC Air Cleaner prevents dirt and grit getting inside the motor—assuring longer life.



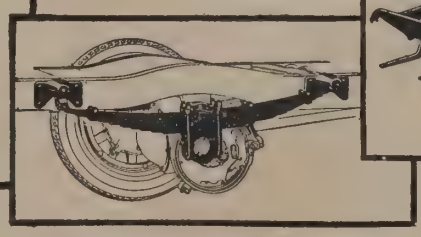
A modern, 3-speed transmission provides proper gear ratios for maximum power under every condition.



Modern Vacuum tank assures constant supply of gasoline to the carburetor on every grade.

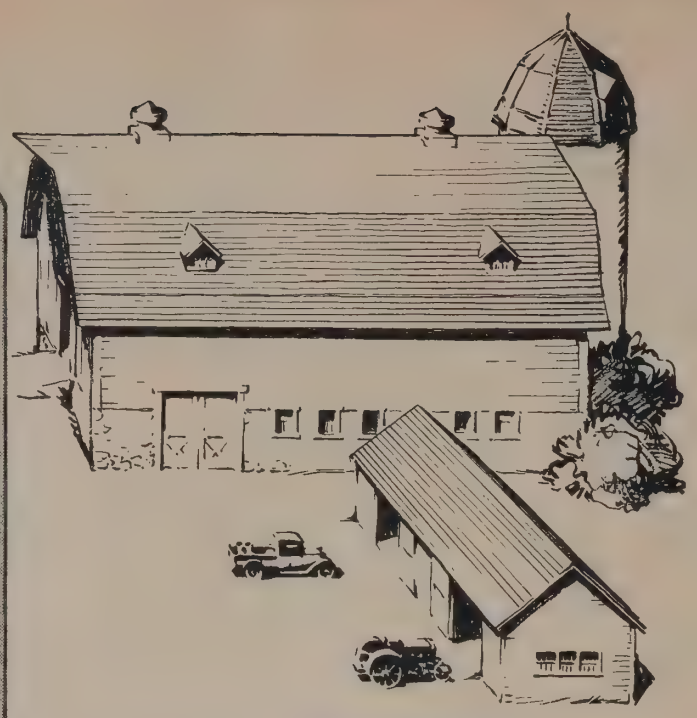


The new AC Oil Filter removes all foreign particles from the crankcase oil—providing for fewer oil changes and longer engine life.



A husky, 6" channel steel frame is a contributing factor to the long life and faultless performance of Chevrolet Trucks.

The rugged Chevrolet rear axle possesses abundant strength and stamina for the heaviest haulage duty—giving faultless performance under every condition.



The instrument panel is conveniently located and is complete with speedometer, oil gauge, ammeter.

Heavy, extra-leaved semi-elliptic springs—set parallel to the frame—effectively cushion the load and chassis against road shocks.

World's Largest Builder of Gear-shift Trucks

Whatever you build build FIRESAFE!

Firesafety is the biggest value you can build into any farm home or building. Sheetrock, the *fireproof* wallboard, provides that safety-value in walls and ceilings.

And Sheetrock does that easily and at low cost.

FIREPROOF . . INSULATING . . VERMINPROOF . . NON-WARPING . . TIME-TESTED . . TAKING ANY DECORATION . . EASY TO PUT UP AND PUT UP TO STAY

Sheetrock is made from pure gypsum, 3/8 inch thick, specially surfaced, and made with the USG patented folding edge for nailing strength.

It will not burn, and therefore provides maximum protection where fire so often originates, in the work buildings of the farm.

Where you want decorative results—in your home—Sheetrock with the USG reinforced joint system that seals and conceals all joints, provides smooth, flat surfaces that take wallpaper, paint, or *Textone*, the plastic paint.

You can always tell Sheetrock by the USG Sheetrock brand on the back of every sheet, with the Underwriters' stamp of approval. Made only by the United States Gypsum Company. Your local dealer has it in stock or can get it for you promptly from our nearest mill.

Sheetrock is inspected and approved as an effective barrier to fire by the Underwriters' Laboratories, Inc.

Cutting Labor Costs

J. HOWARD CLIFFE, PENNSYLVANIA

I NOTE an inquiry requesting information regarding labor-saving methods, particularly in haymaking and silo filling. I would heartily second this request for I have noted that many short cuts are used in one section which are totally unknown in another.

Regarding the silage harvester-cutter, I would say that one of my friends who has a half dozen silos to fill uses one and is well pleased with it. The cost of the machine (about $700) is too high for the man with only one or two silos. I am, however, convinced that when one of the big machinery companies puts out a machine of this sort, operating from the power drive of the tractor and priced under $500, that it will sell like hot cakes.

A method which we used last year to fill our 10x45 silo requires a minimum of labor, as it can be worked intermittently by two men and a boy, over the stubs to carry them to t wagon.

The disadvantages are:

1. The work proceeds slowly w so small a crew.

2. The tractor must be lined anew to the cutter each time t wagons come in.

3. The outfit in the field has wide turning radius. It will tu toward the wagon as sharply as t wagon wheels will permit, but to tu toward the binder, the wagon m be dropped back by two or thr feet by a short piece of chain that the binder can swing o in front of it without hittir and even then the turning radius large. For this reason, the way begin a field is to cut a couple rows through the middle by har and sufficient turning space at t ends, and then turn toward the wa on each time, gradually working t field out from the middle and tur ing idle at the ends. A 1,000- field will make a load to the rou

TRACTOR HAULING BINDER AND LOW DOWN WAGON

or continuously by five men and a boy. The equipment needed consists of tractor, corn binder, three low flat wagons, silage cutter, and two horses. The tractor is used in the field to draw the binder and wagon. A wagon tongue is hooked to one side of the tractor drawbar, and the corn binder to the other side of the tractor drawbar, using in the binder a stub tongue of such length that the bundles are discharged against the front corner of the wagon. Two men are on the wagon. They take turns in catching the bundles and piling them on the wagon. Very large loads can be easily put on.

When the wagons are all filled, the tractor takes two of them and the team one, and brings them in to be cut. This makes a short half day's work and the silage will mount about a foot to the load. No one was in the silo, but at noon and night the silage was levelled off and tramped a little around the edges. No spoilage has resulted. Of course the last three or four feet were levelled and tramped well as filled. The advantages of this system are:

1. Minimum crew of five men.
2. Minimum horses.
3. Two men load a wagon faster than three men can load when picking up from the ground.
4. The corn is loaded as cut and does not lie on the ground to wither in the sun for several hours. This is important when the corn is becoming rather dry for ensiling.
5. The labor of loading is vastly lighter than when the loader is on the ground, stooping to pick up the heavy bundles and then stumbling

(varying of course with size of co and size of wagon) and this is ve desirable.

In regard to the second matter- haying—I would recommend the u of a modern windrow loader. T draft is very much lighter than wi the old push-bar types, and the h is much easier to pull loose as it delivered to the wagon.

When mowing away, there is a d vice for distributing the hay in t mow which I have used for two yea and can recommend. The princip is this: When the fork or harpoon set ready to take up a bunch of ha a spear or "needle" with a rope a tached is thrust down through t bunch and anchored in the hay r maining on the wagon. Thus wh the bunch of hay goes up, this ro is threaded vertically through t middle of the bunch and is take and snubbed around a hook at t side of the mow. Then when t forkful is released, instead of falli straight down on the middle of t mow, it slides down the rope over one side. But little hand forking necessary, and one man in the mo is sufficient. The hard center of t

LOADING SILAGE CORN ON FARM OF J. H. CLIFFE, PENNSYLVANIA

ow under the track is done away th, but the sides are packed tight-

The device is especially helpful a wide mow. It does not work ll with very short, slippery hay, as s will fall apart instead of sliding wn the rope. In heavy, tangled y, however, it saves a great iount of heaving and pulling in the w, and will actually pack more ly in a given mow, as we have und later when we came to bale it t.

The accompanying illustrations e some idea of the hook-up which have recommended and indicate w little lifting and carrying of ndles is necessary. A little cau-us experimentation will show how hook up these machines as closely possible without chafing or strik-g each other. The method is too nple not to have been discovered others than myself, but it does t seem to be generally known en where corn binders are com-only used.

An Advanced Register for Milk Goats

HOARD'S DAIRYMAN:—The Ameri-n Milk Goat Record Association s recently adopted requirements for Advanced Register equivalent to ose enforced by the dairy cattle eeds. Hitherto any registered doe at gave a certain minimum amount one month could be admitted. Now, e must show a yield of a minimum 1500 pounds during ten consecutive nths or, as an alternative, 52½ unds butterfat. Under the old rules, e month's yield was computed on e basis of the result of four days' ilking (not consecutive). Now, the tual yield for ten months, as shown the owner's daily record of every ilking, and checked by the official pervisor each month, determines lmittance to A. R. and is entered on e certificate given, together with e amount of butterfat produced.

Lack of confidence in the claims of oduction made by breeders of milk ats has been a serious drawback to e progress of the industry. It will w be possible for records to be of-red that are authenticated in the me way as those of dairy cattle. hat section of the public intelligent-interested in live stock will have liable data on which to base their dgment of the efficiency of the milk at as a producer of milk. Those oking for breeding stock will be le to locate the best strains by udying the records. The conscien-us and painstaking breeder will be couraged to persevere when pro-cted from the competition of those ho are turning out scrub pure-breds rapidly as possible, and foisting em on the public by misleading ad-rtising.

While this Advanced Register con-rms in general to those maintained the various breeds of dairy cattle, ere are some significant differences. dual standard, making it possible r a breeder to select either quanti- of milk or amount of butterfat as s way into the A. R., is necessary cause both Swiss and Nubian goats ust be considered. The heavy milk-g Swiss breeds give milk much low-in butterfat than that of the Nu-ans. If the Holsteins and Jerseys ere in the same record association, e situation would be a parallel one.

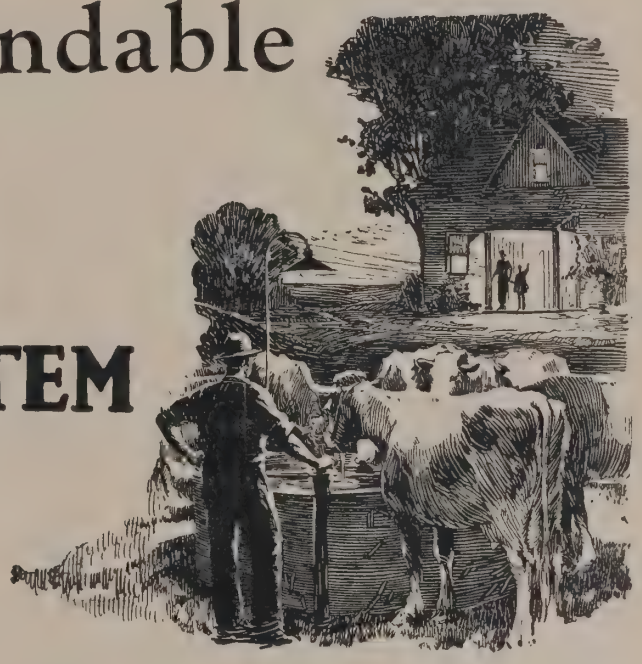
Nubian doe giving 7% milk would t in on an annual yield of 750 unds, while a Saanen in the same ass would require 1,500 pounds of ½% milk. This ratio may not be e one ultimately used when suffi-ent data accumulate to enable one test it thoroughly.

Any daughter of a registered sire may be registered in the A. M. G. R. A., and consequently be eligible to the A. R., if she can meet the requirements. It matters not who or what her dam was, scrub or Angora, she is listed as a member of the breed her sire belongs to and will be rated higher in the A. R. than any pure-bred of the same age that does not give an equal amount of milk or butterfat. This would seem sufficiently democratic but the door is opened still wider by the admission to registry of the male offspring of the fifth cross of a pure-bred sire and an unregistered doe as an "American Pure-bred." Distinctions of breeds and grades are made quite clear in all papers and literature sent out but there is some danger of confusion in the minds of those who think of "registered stock" as an expression meaning the same as "pure-bred."

California. GEO. CAMPBELL.

Use of Milk Powder Increases

Milk powder and condensed milk are replacing whole milk and evaporated milk in the manufacture of confectionery, ice cream, and bakery products, the Bureau of Agricultural Economics of the United States Department of Agriculture has announced. The reason for the shift is that the concentrated products are easier to transport and store.



Figures collected by the bureau show that 66 manufacturers of milk chocolate used 171,542,708 lbs. of whole milk last year as against 228,-821,543 lbs. used by 61 manufacturers in 1925. The quantity of evaporated milk used to manufacture milk chocolate last year was 2,912,-639 lbs. against 3,037,669 lbs. in 1925, and of skimmilk 26,689 lbs. against 6,168,287 lbs.

Consumption of milk powders, on the other hand, shows an increase. The 65 manufacturers used 6,652,127 lbs. of whole milk powder last year, as against 4,396,231 lbs. used by 61 firms in 1925; of condensed milk there was used 5,499,095 lbs. against 4,369,769 lbs., and skimmilk powder 3,270,577 lbs. against 1,437,810 lbs.

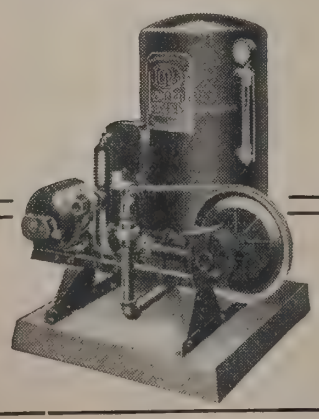
The consumption of all products reduced to the common equivalent of whole milk used in the manufacture of milk chocolate last year shows a decrease of about 10 per cent under 1925.

Save time—save work—with a dependable

WATER SYSTEM

ON THE stock farm, a dependable water system is more than a convenience. It is a time-and-labor-saving necessity.

When you have a D-L Water System, you turn a faucet and you know you are going to get a strong, steady flow of water any time of day or night. D-L Water Systems give you the kind of reliable service that is demanded on the modern stock farm.



D-L Water Systems Low in Price

D-L Water Systems are designed and built to give years of service—without repairs, without attention and without interruption. They are available for use with either central station or farm electric plant current. Capacities range from 200 to 400 gallons per hour capacity and they are priced as low as $83, f.o.b. Dayton.

Product of General Motors

D-L Water Systems are built by the makers of the famous Delco-Light electric plants. Both are products of General Motors, with all that that means in conscientious design and construction. Like all products of General Motors, D-L Water Systems may be bought on the convenient General Motors plan of deferred payments.

Mail the coupon below for more specific information.

400 gallons per hour—every hour

EDITORIAL COMMENT

WISE breeding of dairy cows means to so direct the currents of heredity by a union of male and female as to constantly increase the dairy power and productiveness of each generation of cows. In other words, we must aim to make the heifer a better cow than her mother. We must breed to strengthen and enlarge the dairy current.

THE question is sometimes asked whether cows with yearly records made in a cow testing association will sell for more than those of good type and without records.

According to a recent quotation, best grade springers with records are selling for $130 to $170, and best grade springers without records from $100 to $135. Cows with records average at least $150 apiece and those without records about $120.

DR. H. C. Sherman of Columbia University recently stated that there could be an almost unlimited extension of the dairy industry in this country. Investigations, he said, show that the full allowance of a quart of milk a day is needed for the development of children up to the age of 15. He also stated that milk is just as important to the vigor and resistance of the adult as it is to the child. He recommends a quart of milk a day for every child and a pint for every adult.

In sections of this country where little or no fluid milk is consumed, there is opportunity to develop a dairy industry of sufficient size to provide consumers with the dairy products they need. This will require an educational campaign to get the consumer to use the required amount of milk. If this were done the production of dairy products could be materially increased without causing an overproduction and a break in the present prices.

A DAIRY FARM STATEMENT

We would call our readers' attention to a letter we are publishing on another page under the above title. It may be that Mr. Charles was unusually fortunate, but it is interesting to know that a man with no unusual markets, but with a good producing herd, can make a labor income of nearly three thousand dollars. And this was done despite the fact he credits his farm with only $332 for rent and food supplied by the farm. Many a city laborer would be happy if rent, milk, potatoes, and green vegetables cost no more than this.

But our particular reason for calling attention to this report of farm income and expense is to ask others to send in similar reports of their farms. For the three best prepared reports, not highest profits shown, we will pay five dollars each. The name of the person sending the report will be withheld from publication if desired. We will also pay three dollars each for such other reports as we deem worthy and find space available for publication.

THE CORN BORER

The corn borer is threatening the corn crop and has already done enough damage to show what it is capable of doing if permitted to have its way. Congress has made an appropriation of $10,000,000 to destroy it and plans for battle are being laid. Just how difficult it will be to subdue this insect is problematical. We are sure its destruction will be accomplished, but just how and when we would not care to venture an opinion. The job at present seems large and puzzling, but it will be done.

We remember the chinch bug and its destruction to wheat, corn, and other crops. It seemed for a spell nothing could be done to stay its destruction, but now it is little heard of. The Russian thistle caused many a man in the grain sections of the Northwest to declare it would ultimately take possession of that country. But it has not. The boll weevil of the South was for a time a threatening pest of the cotton crop, but it was considered both a blessing and a curse. It promised to force the cotton grower to practice diversified farming and it did in many instances—that was a blessing.

All these insects and weeds which caused the farmer alarm for a time have been subdued to a sufficient extent that no one is concerned about them. We are prepared better now than ever to fight the corn borer and we believe it will be effectively handled. The dairy farmer with a silo will be able to protect himself from heavy losses and plans being laid by the federal government and authorities in the several infected states to control this insect should prevent severe losses to other classes of farmers.

SAVING AGRICULTURE

President Glenn Frank of the University of Wisconsin, in an address before the annual meeting of the Wisconsin Cheese Producers' Federation, made the following statements:

"These are the times of ready solutions; we want the solution handed out a finished product—like rabbits out of a hat. But a magician is a showman, not a statesman. Wisconsin doesn't need a showman. It needs a statesman.

"The problems of the farmer can never be solved by government subsidies, laws, or ready-made articles built around personal and political ambition. The solution of the farmer's problem will come just as soon as he takes into his own hands the distribution as well as the production of his own products.

"Farmers will never succeed with any marketing scheme they aren't big enough to think out themselves. Here is one thing I want you to remember, if you forget everything else I say to you today: Relief for agriculture must come from the bottom up, not from the top down."

It is not out of place to carefully consider these statements of President Frank and not be carried away by ready-made schemes to save agriculture. Some of them sound plausible, but it is well to remember that no industry is saved from without but rather from within—by those engaged in it.

TWO DAIRY FARMERS

The chief ambition of Hoard's Dairyman is to help develop a dairy industry that offers opportunity for those engaged in it to make a good living, to provide well for the family, and lay aside a competency for old age. The progress made in the past few years toward this accomplishment is most encouraging. As year succeeds year we find more dairy farmers with good cows; better systems of feeding practiced; more suitable crops grown for building rations; and an increased number of organizations for marketing dairy products. But with all this, not all farmers are making money.

Recently our attention was called to two dairy farmers operating farms under practically the same conditions, but with entirely different results. Both handled most of their work alone; sold milk and hogs chiefly and patronized a co-operative creamery. One made a labor income of $1,200 and better than 10% on his investment in 1926; the other did not quite make expenses. The farmer who made a profit keeps 20 good cows and knows how much fat each one produces. The other farmer keeps 12 cows but does not know their yearly records. The farmer who finds dairy farming a profitable business sells three or four grade cows each year at prices ranging from $150 to $250 apiece; the other farmer sells none. The successful farmer also turns off each year a good bunch of hogs raised at minimum cost; the other farmer has hard luck with his swine.

How can we help the farmer who is unable so far to make any money on the farm? His family desires things that make life more pleasant ; we would like to help him. He doesn't read v any purpose or will he put into practice impro methods. He works hard with his hands but head is idle.

These men well illustrate two classes of d farmers, the successful and the unsuccessf those who are students of their business and t who are not.

THE GAS TAX

According to the Minnesota Highway Ne good roads save from 2 to 3 cents a mile on automobile, tires, and gas, and more if tim considered. The gas tax is a good investm The chief purpose of the gasoline tax is to b and maintain good highways, and anyone objects to raising money in this way to build g roads has not considered the fairness of a of this character and the amount that can saved by building good roads.

On the average, a gallon of gas will carry automobile about 15 miles. If the road is m of concrete or other hard material, there wo be a saving of at least 30 cents in the use o gallon of gas. If the tax on gasoline is 2 ce the motorist will be ahead 28 cents, to say noth about the time and temper saved.

A tax on gasoline is not only a good investm for the motorist, but is a sound, fair way of r ing money to build good roads. The larger car and the greater distance traveled, the m road is used and at the same time the greater be the tax. We wish it were possible to figure a system of taxation for all purposes that is equitable as the gas tax and at the same time turn so much for money invested.

LIKING ONE'S JOB

A few weeks ago we went with a friend call on some farmers to present a plan for eradication of tuberculosis from poultry flo The majority of those to whom the plan presented were interested and agreed to co-o ate in the work. One woman flock owner was interested and could not be persuaded. The r son given for not being interested was v simple; it satisfied us and we departed. "I d like chickens," was the answer given us.

We pondered over this statement after we ca away. We applied it to other things than to r ing chickens. We tried to analyze the psychol of it in relation to the influence it may or n not have on one's success.

This flock owner does not like chickens. fewer there are and the farther away they s from her the better she likes it. Because of t the flock gets little help from its owner. shifts for itself; it fights its own battles agai disease and it gets its food like scavengers in night time. It gets nothing and gives everythi

Do we realize the tremendous importance t "liking one's job" has on the outcome of o efforts? Does this attitude of mind have a c mercial value? We believe it does. We beli profits are not made altogether from and beca of feeds and physical exertion but partly f the mental attitude of "liking one's job." W Because it is the ignition spark that fires us i action to do the things that count most in fluencing the returns from flocks and herds.

It is a good thing occasionally to take stock one's working equipment and methods. If a chine is out of order, we must repair it befor can be used; if a method is wrong, it must made right to get better results. Do we incl "mental attitude" in our study of working eq ment and methods? We venture to suggest t on every farm where the returns from pou and other live stock are not satisfactory, th is something wrong in the department of "lik one's job."

Treating Oats for Smut

ever treated oats for this and would like to know ow it is done. Will you please give the method?
New Richmond, Wis. C. H.

The following method is practical and effective hen properly done: (1) Thoroughly fan the oats remove foreign material, light oats, and smut eces of any size. (2) Mix one pint of formalin ith 10 gallons of water for 80 bushels of oats to e treated. (3) Sprinkle the solution over the ts, using one pint to each bushel, and mix thorghly. (4) Pile the oats up in a cone shaped le and cover with blankets, canvas, or sacks to event the escape of the formaldehyde gas. 5) After two hours uncover the oats. If they ve been thoroughly mixed they will have abrbed the moisture so thoroughly that they will be y enough to sow at once in a broadcast seeder or ill. (6) If oats are not seeded at once they ould be spread out in a thin layer and stirred ocsionally to allow the escape of the formaldehyde s. Do not put the oats back into infected sacks bins after they have been treated, if they are t seeded immediately after treatment.

Using Liquid Manure

I recently noticed that some one had written askg whether or not it would pay to build a cistern om which to handle liquid manure. Would you ease give me the plan in use on Hoard's Dairyan Farm?

One of the plans I have noticed in use was a stern in which they used a pump like the ones ed on a thresher tank wagon. They had a large x on top of the cistern on which the pump was cated and the hose was lowered into the urine ring the process of pumping. The pump on the x made it possible for the water to run into the nk. I do not know whether the plan was satisctory or not but I never could detect any odor.
Des Moines, Iowa. W. C. C.

We have been unable to locate very many stos of the use of liquid manure cisterns and anticate that the factor that has kept down larger use liquid manure has been the labor involved in ndling it and the fact that there are some other thods that are reasonably satisfactory and effint in conserving the liquid manure.

An ordinary large diaphragm pump will work tisfactorily where the liquid manure only is ained into the pit. If a large quantity is to be ndled, it would possibly be desirable to get a mp similar to that used by ditch diggers in empng their trenches of water. Some of these mps operate by engine, but you can secure a nd pump of this character that should prove ry satisfactory.

We have an occasional report of unsatisfactory sults from the attempted use of a liquid manure ctern. That is, the application of the liquid mare has not brought the anticipated results. We ticipate that this may have been due to the fact t the cistern was not tightly covered, with the sult that fermentation destroyed much of the tilizing constituents. To secure the best rests, the cistern should be well covered and so anged that there will form a body of carbon oxide over the top of the liquid and so retain the ses that might otherwise escape.

On Hoard's Dairyman Farm, we make it a practe to haul out the manure every day except durig certain periods of the summer when the cows e on pasture and it is impractical to attempt haul manure to the field. In this case merely store the manure in a well-built pile in te barnyard. We use considerable quantities of dding and also make use of the waste litter m the horse barn in the gutters so as to assist i the absorption of the liquid. In this way, very le of the liquid manure is wasted. We believe t on most farms where labor is usually at a emium, this will be found quite as efficient and re economical than to attempt to handle the uid through a cistern.

Curing Legumes Difficult

On account of living in Webster County, West rginia, we have so much rainfall it is impossible f us to cure red clover, beans, or alfalfa, and I a wondering if we could cut such and put in the s with corn. Would this take the place of leme hay for roughage for cattle?
Cowan, W. Va. J. H. F.

The legumes, such as red clover, beans, and alfa, are best suited for hay, and the attempt uld be made to so cure them if this is at all ctical. This can be done even in rather rainy weather if advantage is taken of prompt methods of handling. The hay can be cut, if necessary, when still wet with rain, but preferably after it has dried off. It can be raked up with a side delivery rake in 24 hours, or in some cases what has been cut in the morning can be raked up late in the afternoon. While it would be preferable to allow it, as a general rule, to cure in the windrow for two days, we know of many men who make it a practice, particularly in catching weather, to get the hay into the barn as soon as it has reasonably cured in the windrow.

The side delivery rake puts the hay in a loose windrow that dries out and cures the hay very quickly, particularly if there is warm, dry weather. Even if it is rained on in the windrow, after the top portion has dried off the side delivery rake can be used to turn the windrow over, and after this has been dried out the hay can be brought into the barn. An additional convenience for prompt handling of the hay is the use of a hay loader.

Where it is found impractical to cure these legumes as hay, they may be converted into silage with reasonably satisfactory results. The main trouble with most legume silage is that the green hay contains so much moisture that it will not cure out properly in the silo. To overcome this, it is the general practice to allow the hay to stand in the windrow until it is well wilted and partially dried out. It is then raked up and hauled to the cutter to be put into the silo.

The major difficulty of attempting to ensile legumes with corn is the fact that these two crops do not frequently reach their best maturity for feed at the same time. The result is that there is the danger that one crop may be too old and dry and the other too young and wet. If the attempt is made to make this combined silage, it would be preferable to let the corn reach its usual maturity and allow the legumes to be somewhat beyond the usual stage of maturity when used for hay purposes. If the legumes are allowed to reach the greater maturity, they will not contain as much moisture and it may not be necessary to allow them to dry out quite so much in the field.

However, as previously stated, we would make a serious attempt to cure these legumes as hay and only ensile them when weather conditions make it impractical to make hay or when there is anticipated shortage of corn for silage.

Emergency Hay Crop

I will be in need of hay for the coming year. What crops will make good hay the first year seeded? My soil is heavy clay; it will grow clover. Which variety of sweet clover do you recommend, if any?
Clear Lake, Wis. W. P.

This inquirer is located about fifty miles northeast of Saint Paul, Minn. For that location the following recommendations are suggested:

We would give first consideration to soy beans because the hay is more suitable for feeding cows due to its high protein content. The Wisconsin Black, Black Eyebrow, Manchu, and Ito San varieties in the order named are suitable for this location. These varieties will mature for hay in 90 to 100 days. The seed bed should be prepared as for corn and as many weeds killed by surface cultivation as possible before the crop is seeded. The seed may be drilled in rows 30 or more inches apart and the plants cultivated, or it may be drilled in rows about 14 inches apart by plugging every other hole in a common grain drill, or it may be broadcasted. If drilled, from 40 to 60 lbs. of seed per acre are needed, and if broadcasted from 60 to 80 lbs. are needed. Seed should not be put in too deeply—about 2 inches is deep enough. Seeding should not be made when soil is wet. Seed should be inoculated and this culture may be secured from the Wisconsin College of Agriculture or from seedsmen. After plants are up three or four inches, one may harrow field to kill weeds, doing this in the afternoon when soy bean plants are toughest. Harrowing may be repeated when plants are about six inches high. A yield of from 1 to 1½ tons of hay per acre should be secured in this locality from varieties suggested. This hay is equal to alfalfa hay in feeding value. It is usually a little more difficult to cure than alfalfa, due principally to less desirable curing weather at the time the crop is ready to harvest. Seeding may be made between May 20 and June 20, the earlier date being preferred if soil is warm.

The next crop to be considered is sudan grass. Though not a legume it produces an acceptable dry roughage for cows when properly supplemented. The seed bed should be prepared as for corn. No advantage is gained by early seeding. The first week in June is suggested for this locality. About 15 lbs. of seed per acre is the best rate of seeding and this may be drilled or broadcasted, there being little advantage in either method. The Iowa Station reports an average of 4 tons of hay per acre from seedings made June 7. Sudan hay fed with silage requires a concentrates mixture containing about 18 per cent of digestible protein to properly balance the ration.

We would next recommend a combination of oats and peas seeding at the rate of about 1½ bushels of each kind of seed per acre. The seeding may be made early as for oats. A yield of about three tons of hay per acre should be secured from this combination. The crop should be harvested when the oats are in the milk stage. The medium to early varieties of oats are best and the Canadian field pea generally gives satisfaction. The pea, being a legume, makes the hay of this combination a good roughage for dairy cattle.

Oats seeded alone and cut when the seeds are in the milk stage make a fairly good emergency hay crop.

The common millet is suggested though it should be the last resort for it is not as good as the crops previously mentioned. If used for feeding cows, it should be supplemented with a concentrates mixture containing 18 to 20 per cent of digestible protein if no legume hay is fed with it.

We do not recommend sweet clover for hay. Alfalfa is much better. For pasture, we recommend the white biennial sweet clover. It should be seeded this spring for next season's pasturage.

Heating Water With Feed

I have been reading the series of articles on feeding cows and from the information have formulated a concentrates mixture of 200 lbs. of bran, 100 lbs. of middlings, 100 lbs. of linseed meal, and 200 lbs. of gluten feed to be fed with timothy hay. This mixture contains about 19 per cent of digestible protein but because of unheated water I am planning on substituting 200 lbs. of ground corn for 100 lbs. of bran in a 1,600-lb. mixture in order to provide additional heating material for the water and to feed this mixture at the rate of slightly more than 1 lb. daily for each pound of fat produced weekly. What do you think of this plan?
Newald, Wis. H. G. G.

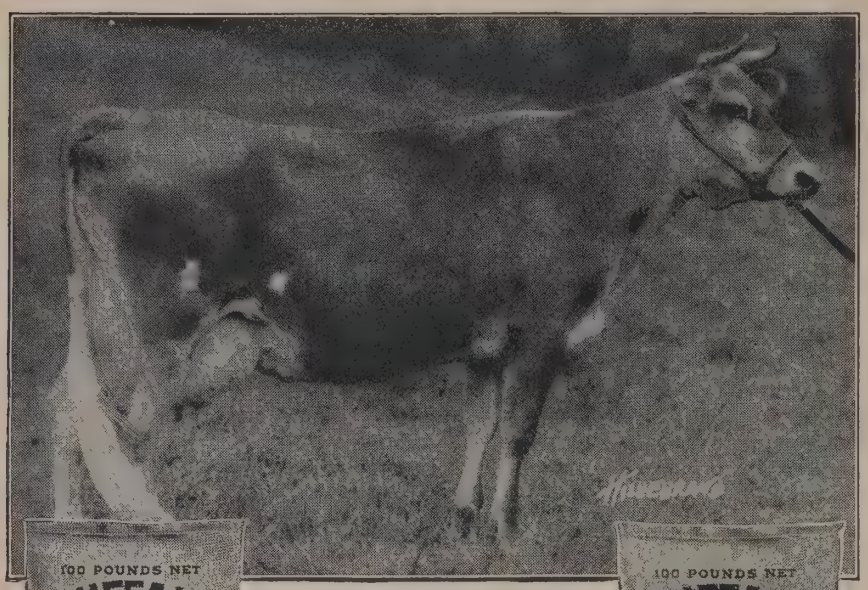
If these cows are not warmly housed and are offered water under conditions that they will not drink all they need, as when watering them but once a day from cold water, it is advisable perhaps to make the change in the concentrates mixture though this is an expensive way to warm water.

A better way is to house the cows in fairly warm quarters and to give them opportunity to drink three or four times a day even though the water is not as warm as desired.

The important thing about watering cows is to offer the water under such conditions that they will drink all they need. This does not necessarily mean that when the water is not warmed a part of the feed energy is used specifically to bring the water up to body temperature though indirectly this is what occurs. A certain amount of heat is produced in the process of mastication and digestion. The proportion of this that is used to raise the temperature of water up to body temperature depends on how warmly the cows are housed and on how much water is drunk at one time. If a cow is watered but once a day and she takes in a comparatively large quantity of cold water, there may not be enough heat produced from the ordinary process of mastication and digestion to warm this water, in which case additional feed nutrients are used for heating. After the water is once warmed there may be a surplus of heat produced in the body.

If it is desired to include corn in the mixture we suggest the following: 200 lbs. each of ground corn and of bran, 100 lbs. of middlings, 200 lbs. each of linseed meal and gluten feed, and 100 lbs. of cottonseed meal. This mixture contains 19.3 per cent of digestible protein and is better suited to be used with timothy hay. We would feed this mixture according to production. If the cows are housed and watered under conditions that require some additional heating assistance from the feed, give each cow a pound extra of corn meal daily. Cobs, coal, wood, or oil are cheaper than corn to warm water for cows. Also, cows will not drink all the water they should if it is very cold even though they may be highly fed.

WHEN A GREAT COW AND A GREAT FEED GET TOGETHER . . .



only one result is possible, a great record in milk production. For the past 7 years, Sophie's Emily, a Jersey cow owned by Randleigh Farm, Lockport, N. Y., has been getting

Buffalo Corn Gluten Feed

as the big protein ingredient of her ration. In these 7 years Sophie's Emily has yielded to her owners 110,193 lbs. of milk and 5424 lbs. of butter fat. Her latest and best test ended with the great mark of 17,393 lbs. milk, 838.93 lbs. fat for one year.

Production of this kind, year in and year out, shows beyond any question the worth of the feed as well as the greatness of the cow. Mr. T. E. Grow, Supt. at Randleigh Farm writes: "We have always used Buffalo Corn Gluten Feed in our test ration, and it is our opinion that when used in connection with other good feeds it has no equal as a source of protein.

Whether your cows are purebreds or grades they will produce more milk and remain in better condition, over long periods of time, if their ration is built around **Buffalo Corn Gluten Feed** as its protein basis.

Cream Grading in Ontario

J. W. WHEATON, ONTARIO

CREAM grading and payment of cream on grade came into effect in Ontario in May, 1926. There are around two hundred and fifty creameries. With perhaps a dozen exceptions, all began grading at the time decided upon by the government. So for a movement involving as it does so many radical changes in the operation of the business it has come into force with less friction than any other innovation for the improvement of dairying in this country.

The cream grading act expressly stipulates that each shipper's cream must be graded at the creamery. This means an individual can for each shipper and which must be delivered to the creamery. Formerly individual cans were not necessary for all shippers. Where cream is gathered by trucks the truck driver formerly sampled each shipper's cream and dumped it in with other cream in the large carrying cans on the truck. This cannot be done under cream grading. The shipper's cream in his individual can must be carried to the creamery to be graded.

The Grades

The different grades and the regulations generally are very similar to those in force in other countries where cream grading and paying on grade is in operation. There are four grades of cream—"Special," first, second, and third or "off" grade. "Special" is cream clean in flavor, of uniform consistency, with not more than thirty-one hundredths of one per cent acidity when graded and not less than 28 per cent fat content. First grade cream must be reasonably clean in flavor, of uniform consistency, acidity not more than sixty-one hundredths of one per cent when graded. Second grade is cream that does not meet the requirements of first grade as to flavor and consistency or has an acidity of over sixty-one hundredths of one per cent. "Off Grade" is all cream that does not qualify for second grade and therefore should not be made into butter of any kind. This grade is returned to the shipper.

Price Differential

The price differential for the different grades are briefly as follows: Special commands a premium of one cent per pound of butterfat over first grade and first grade a premium of 3 cents per pound of butterfat over second grade cream. There is of course no premium for second grade over "off" grade as the latt is not accepted by the creameries.

Grading Done at Creamery

Grading of cream is done by t buttermakers in the creameries or the case of some of the large ce tralized concerns by some employ specially trained for this work. Du ing 1925 creamery instructors dev ed a large share of their time training buttermakers and others the proper grading of cream. The men are now grading cream und the Act and the creamery instructo supervise, checking up on grading each of their visits to the creameri

Before the Act came in for many of the larger creamer strongly insisted that grading shou be done by government graders. Th is the plan followed by provinces Western Canada where cream gra ing and paying on grade is in for It is, no doubt, the ideal plan if can be effectively carried out. T western provinces, however, ha comparatively few creameries compared with Ontario and therefo the employment of government gra ers to do the grading is not a ve difficult matter, as comparatively f men are required to take care of the creameries.

Definite Improvement in Qualit

With one season's experience grading to look back upon it is pos ble to size up, to some extent, least, its effect in improving t quality of Ontario butter. In doi so, however, we have some defin figures to fall back upon. John Scott, chief creamery instructor a official grader, in his report gives t following comparison covering t first six months of cream gradi The percentages under "cream" a for first and special grades as seen the instructors from day to day the creameries; the percentages u der "butter" are for first grade b ter as graded from day to day at t Butter Grading Station:

	Cream	Bu
May	66.8	6
June	76.3	7
July	73.8	7
August	78.8	7
September	80.6	6
October	84.6	7

Why there was a falling off in t percentage of first grade butter September with over 80 per cent the cream Canada received grad first and special, the report does n say.

GUERNSEY BULLS, OWNED BY VALLEY GEM FARMS, WASHINGTON, HAULED BAND AROUND THE RACE TRACK AT THE SKAGIT COUNTY FAIR, WASHINGTON

Cow County, U. S. A.

Most folks think of Waukesha County, Wisconsin, as Cow County, U. S. A., but it is much more than that. It is the workshop and playground of several hundred farm families who have learned that some things can be done better collectively than individually, that self-help is also a good thing, that business men are not nearly as bad as vote-seeking politicians and front-page farm leaders would have them believe, and that all work and no play makes Jack a dull boy.

On March 15, the sales pavilion at Waukesha, where their annual dairy and agricultural show is held, opened its doors for the ninth time to admit exhibits and serve patrons. We asked the secretary how many people he expected. He replied, "Between 10,000 and 12,000."

The show is open four days and each day is concluded with an evening program. This year the climax was reached the last evening when all the good looking males of the community dressed up as women and put off the figures of the day by putting on the "Womanless Wedding."

Something is going on all the time. Fred Thomas, the secretary, isn't trying to rescue cars from the red tags of the Waukesha police because of their being parked on the sidewalk, but is quietly making sure that some of his more than a hundred committeemen and women are on the job when and where they should be.

We never saw such good co-operation and so much of it. These progressive dairymen have found out that it is hard to get something out of a dairy show unless they put something into it. They give of their time and talents without reserve, taking in lieu the satisfaction of doing something that needs to be done for the benefit of the community.

The dairy cow is, of course, the main attraction. We dare say there were more people at the ringside than watched the judging at the National last fall at Detroit—at least, at times. The pavilion accommodates about 150 head of cattle for show purposes. The five breeds were represented as follows: 16 exhibitors with 58 Holsteins, 7 exhibitors with 38 Guernseys, 3 exhibitors with 20 Jerseys, 4 exhibitors with 20 Ayrshires, 3 exhibitors with 7 Brown Swiss, 37 exhibitors with 143 cattle in all. W. W. Yapp of the University of Illinois did the judging.

Classes were open, also, to sheep, swine, and horses. Several entries were made.

All in all, the Waukesha County Dairy and Agricultural Show is the best managed affair of its kind we know of. It must be seen to be appreciated and is worth going many miles to see.

Oleomargarine Legislation

A new generation has come on the scene since the time a few earnest men put up a valiant and winning fight for what was then considered a minor part of agriculture. They secured federal legislation that compelled oleomargarine to sell for what it was and not adopt the livery of butter. State laws were also enacted, but with the passing of time there has been some let down and the dishonest sale of oleomargarine to unsuspecting consumers is again a matter of moment.

To meet this situation, the National Dairy Union has made a survey of the oleomargarine legislation of the several states and has prepared suggestions for state laws that may be more effective in securing the highest merchandizing of oleomargarine. A brief synopsis of the suggested legislation is as follows:

1. Defines oleomargarine in terms identical with the federal statute. This is an important provision to secure strict and uniform enforcement.

2. Prohibits use of tax-raised funds in any institution to purchase imitations to be used in place of butter.

3. Makes false advertising of oleomargarine a misdemeanor.

4. Requires a state license for every manufacturer or dealer, hotel keeper or boarding house keeper who sells oleomargarine and prohibits manufacture and sale of all oleomargarine which is colored to look like butter.

5. Provides fair but strict terms for licensing and fixes the fee which the state collects to provide funds for inspection and enforcement.

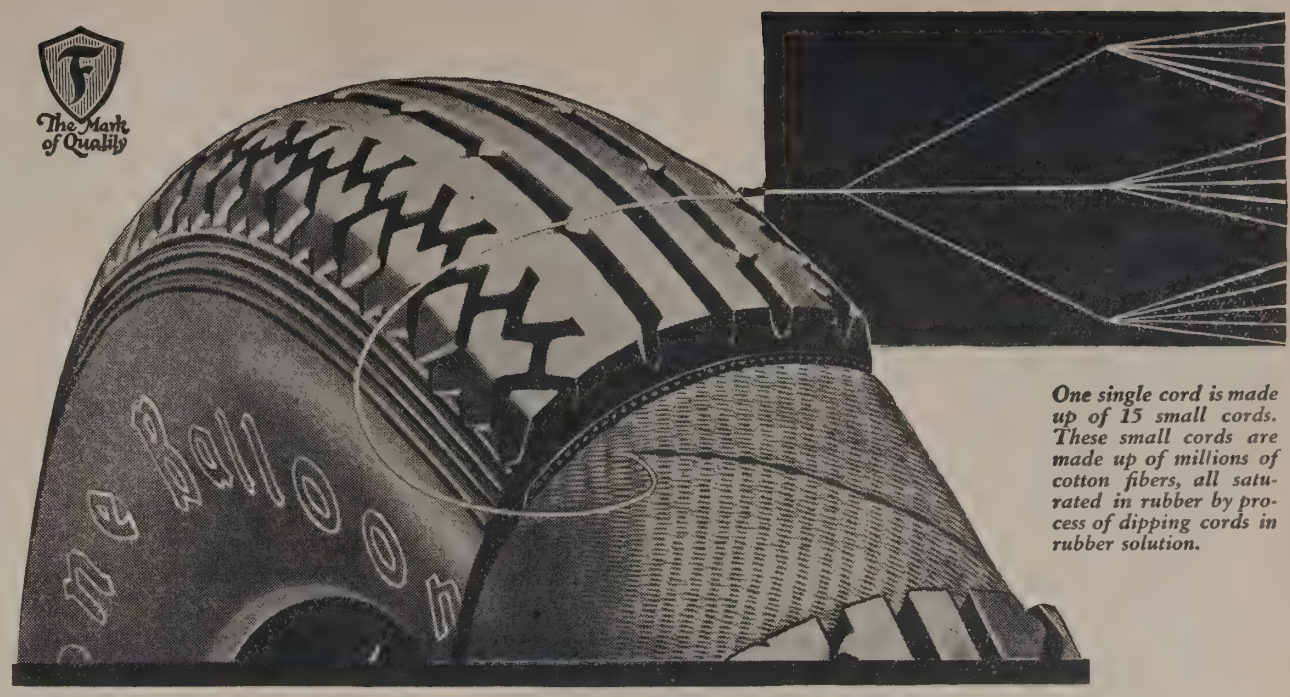
6. Provides for mandatory display of licenses and placing of signs on all oleomargarine offered for sale.

7. Provides for uniform bookkeeping showing purchase and sales, subject to public inspection.

A copy of the pamphlet containing a discussion of oleomargarine legislation and the proposed law may be secured by writing the National Dairy Union, 631 Pennsylvania Ave., Washington, D. C.

Tommy is fond of squeezing toothpaste out of his shiny new tube.

"Don't take too much this time, dear," his mother said to him one morning when he was cleaning his teeth.



"How much may I have?" asked Tommy.

"Well, I should think a little bit, perhaps as big as a bean."

Tommy gave a great pinch and out shot the paste.

"Oh, oh!" exclaimed his mother, "not all that, Tommy. Didn't I say as big as a bean?"

"Yes," replied Tommy, "this is a stringbean."

One single cord is made up of 15 small cords. These small cords are made up of millions of cotton fibers, all saturated in rubber by process of dipping cords in rubber solution.

FIRESTONE

Dips the Cords of the Carcass in a Rubber Solution

Here you see one of the cords pulled from a Firestone Gum-Dipped Balloon Tire carcass. It is untwisted to show how it is constructed of fifteen smaller cords composed of millions of cotton fibers. There are thousands of cords like this in each tire. Before building, Firestone dips these cords of the carcass in a rubber solution. Every fiber is saturated and insulated with rubber, adding great strength and enabling the cords to flex with minimum friction.

To build a tire with such light, flexible walls and such a flexible tread, required a much stronger and more durable carcass.

This important advantage and the scientifically-designed Firestone Balloon Tire Tread, are accountable for the remarkable performance of Firestone Balloons.

See your Firestone Dealer today to obtain the unheard-of safety, comfort and long mileage of Gum-Dipped Balloon Tires.

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page but your editorial must not exceed 250 words. Hoard's Dairyman assumes no responsibility for opinions expressed.

Wants Profits of Middlemen Lessened

HOARD'S DAIRYMAN:—I note in the O. B. & B. column a letter written by a man who signs: "Just an American Citizen." In this letter he refers to my position as "absurd." Now, of course, I don't know this man—he does not mention his name, but as the heading of the letter states, "Cut Out Government Control," I must take exception to the reference to my letter of some weeks ago in this manner. I have in no way advocated government control.

To reiterate, I suggested that legislation should be passed that would restrict the amount of profit that could be taken by brokers, commission men, etc., on food products in this country. This can be a law and need not call for government control.

I don't pretend to have a detailed scheme but a theory that the best method of helping the American farmer is not by facilities which enable him to obtain money to raise more food and sell it at a loss but, in place of this, arrange such laws that assure him of some of the excess profits now accruing to the so-called middleman.

If a western farmer, for instance, gets about $1,400 for a car of beans and the so-called bean broker in Chicago gets a commission (?) of about $500 on the same car, that is all wrong. And, further, I read in Paul L. Vogt's book, "Introduction to Rural Economics," that a retailer gets 54% on Connecticut onions and the producer gets 28%. Certainly that is not fair when it is recalled that the producer furnishes land, fertilizer, seed, labor, money, etc., and all for a net profit that is less than labor pay.

Of course this is somewhat beside the point. I mean I intend to refute the inference that I have advocated any degree of government control. My impression of such control is that it involves actual administration by government employes or a commission under the direction of a government employe. Such is not the case in the idea I have in mind. To reiterate again, I want a law to prohibit the taking of more than a small per cent off the price of food products by so-called middlemen.

It would be interesting to have some of the other farmers that read Hoard's Dairyman have a say regarding this matter and of course "Just an American Citizen" should explain.

Michigan. OSCAR C. GOTTESLEBEN.

Care of Dairy Cows

HOARD'S DAIRYMAN:—Would like to write a short note for the O. B. & B. column regarding the care of dairy cows. Every one agrees that the first requisite for dairy success is the comfort and health of the cows. We hear and read a great deal about cow comfort but my observation is that the comfort is chiefly for the owner or caretaker, not for the cow. My first point is that the confining of cows in stanchions for the long winter is very injurious to the health and vigor of the animal. I do not believe any form of stanchion, even the so-called humane variety, should be used and some other method allowing the cow more freedom, exercise, and comfort must be worked out. How long would a man retain his health and vitality if confined in stanchion for six months every year? Still we expect the cows to do so.

The system of allowing the cows to run loose, as advocated by Professor Fraser in Hoard's Dairyman last year, appealed to me. I am sure the correct housing of the cows is just as important as the feeding if not more so, if the health and vigor of the animals are to be maintained. I would like to see more articles written on this subject from those with experience. Am sure in the future we will get away from stanchions and evolve a new system of cow comfort not measured by the amount of steel and concrete in our barns but by the amount of freedom, exercise, and sunshine the cows receive.

Wisconsin. FRANK HUSER.

Breeders as Salesmen

HOARD'S DAIRYMAN:—This is the reply I got to a letter asking information on some pure-bred Holstein heifers which I saw advertised. I specifically asked about the breeding and the production record behind them:

"The breeding would be hard for me to outline but we have always tried to keep good bulls, and our herd of cows are good producers. Used to belong to the cow testing association, but we did not have any boarders so we don't belong now. Also had some official testing. I don't know if this answers your question on breeding. We don't value pedigrees so much as individuality but, of course, both together should be all right."

This man is in a business which he does not understand. Apparently he is satisfied not to know anything more about it. A salesman who knew a little about the goods he was selling would starve to death.

Our small breeders frequently make the mistake of not studying their pedigrees, not following up their breed in their breed and dairy papers and when asked about their stock they reply "Wait—I've got the papers in the house. I'll see if I can find them."

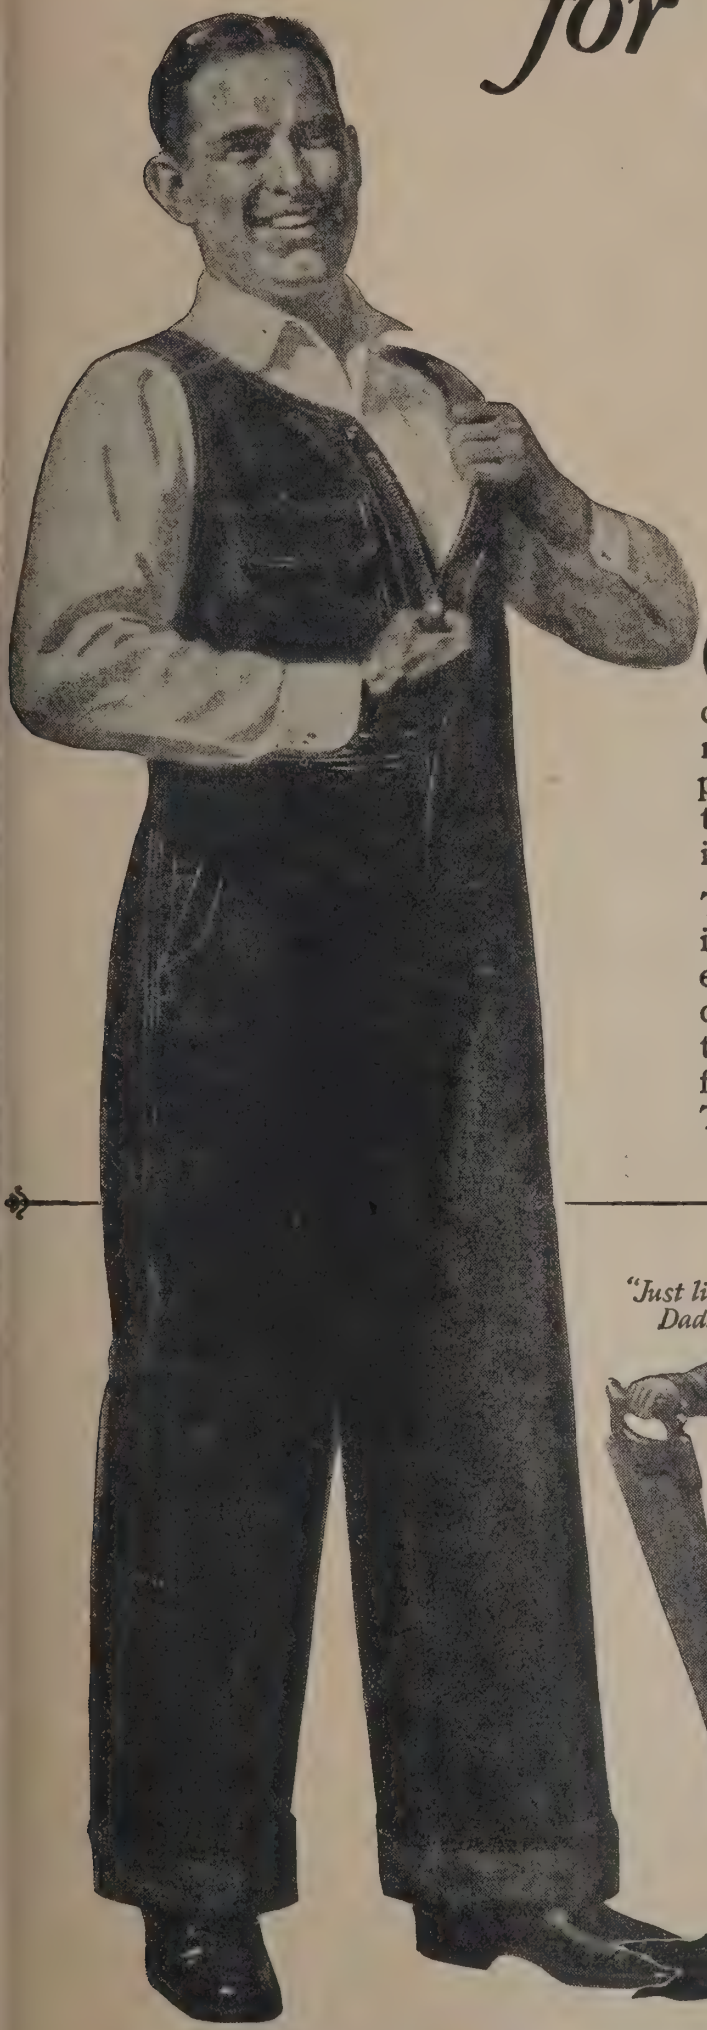
Socrates wisely said, "You've got to know your onions."

Minnesota. S. A. ALDRICH.

Appreciates Hoard's Dairyman

HOARD'S DAIRYMAN:—We certainly appreciate your most valuable farm and dairy paper. I do not see how we could farm without it. One of our neighbors made us a year's subscription as a present—that is how we got acquainted with it. It is worth many times its price each year. Too bad every farmer and dairyman in the United States do not have it come to their homes regularly.

Some articles written in the O. B. B. Dept. are quite amusing and also very instructive. I certainly admire the writers on the Sabbath question in issue Feb. 10. I think they surely hit the nail on the head on the Sabbath question. It looks to me like the Saturday or Sabbath keepers would learn after awhile. I feel sorry for them that they are so blinded, for about all they seem to see or do see is we should keep the Sabbath and the old ten commandments when Jesus' teaching is so much better and is for us now. God bless them and help them to see what He has for them in His precious word.

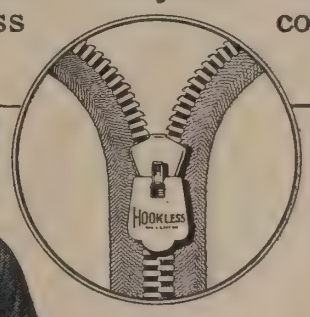


Idaho. FRANK ALTENEDER.

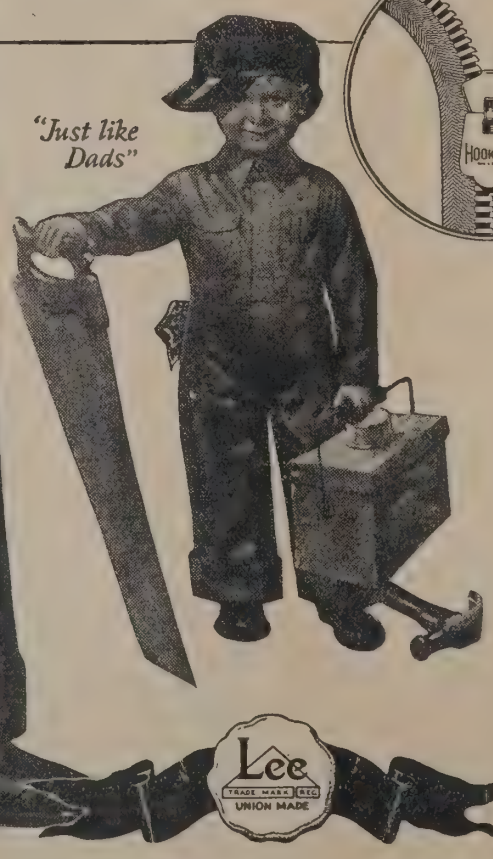
$1,000 for a NAME

for Lee *Buttonless*

Union-Alls, Overalls Play Suits



Presto . . . it's open!
Presto . . it's closed!



ONCE more Lee leads the world in improving work clothing. Think of it . . . no more worrying buttons. One pull and it's fastened better than buttons ever could fasten it. A time saver . . repair saver.

The Lee Hookless Fastener is the greatest improvement ever made in work and play clothing. It is combined with the superior long wear Lee fabrics introduced last year. The Hookless Fastener will not jam, rust or break and launders with perfect safety. It can be had in Lee Union-Alls, Overalls and Play Suits. The same garments available with buttons also.

Ask your dealer to show you the new Lee Buttonless Union-Alls, Overalls and Play Suits. Inspect them . . . try them on . . pull the Hookless Fastener up and down. Then enter the $1,000 cash prize contest.

$1,000 *in Cash Prizes!*

First Prize	$250
Second Prize . . .	125
Third Prize	75
Fourth Prize . . .	50

One Hundred Prizes of $5 Each

Rules —

1. These prizes will be given for the best names received for Lee Buttonless Work and Play Garments, together with reasons for the name, written in not more than 25 words. Any number of names may be submitted but each name must be accompanied with reasons.
2. All names with accompanying reasons must be written on a Lee Official Entry Blank. Entry blanks can be secured from any dealer in your town handling Lee Union-Alls, Overalls or Play Suits. There are Lee dealers in nearly every city and town in the United States.
3. You can get many valuable suggestions for a name by carefully inspecting the Lee Buttonless garments at any Lee store and by talking to any man or boy who wears Lee garments.
4. Send your entries to Prize Department 125, The H. D. Lee Merc. Company, Kansas City, Mo. No entries returned.
5. In the event of a tie for any prize offered, a prize identical in all respects with that tied for will be awarded to each tying contestant.
6. Contest opens March 1st and closes June 1st, 1927. Anyone may compete except Lee employees and their families.

Subscription Rates

Subscription in United States and Mexico three years for $1.00; single year, thirty-five cents. Canada, three years, $2.50; one year, $1.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $1.00 a year; not in Postal Union $1.50 a year. These rates include postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers who farm with businesslike methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received thirteen days previous to the date of publication. Advertising to be classified or changes in advertising must reach us three weeks previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

"The making of butter and cheese is no profitable calling for an unthinking man. It demands brains."—I. J. CLAPP.

News From Washington, D. C.

[Special to Hoard's Dairyman.]

Washington, D. C., March 26—The decision reached some weeks ago that the failure of the second deficiency appropriation bill left the Department of Agriculture without money to put the Lenroot Milk and Cream Import bill into effect seems to be final. Some emergency matters left without funds are taken care of by roundabout methods of using other funds, but the officials are of the opinion, apparently, that this is not an emergency. There are prospects for a deficiency bill in the first weeks of the next session of Congress, making money available perhaps as early as the holiday vacation.

Agitation over tariff matters continues coming up from new angles almost every day. There is so much agitation and so many requests that it seems to be moving very rapidly toward efforts by Congress next winter to make major changes in the law. At the same time the Republican leaders in both House and Senate Committees, Chairman Green of the Ways and Means Committee, and Chairman Smoot of the Senate Finance Committee have issued statements stating that no major tariff legislation would be considered in the next Congress. Canadian reciprocity has been again suggested by officials of the Dominion and is an international problem now laid on the doorstep of the President. The proposal is said to be that "natural products" of both countries should flow without duty either way across the line. The query is natural as to the inclusion of milk, cream, butter, cheese, and other manufactured dairy products in such free movement, and the results which might come. There is a big demand here for increasing the duties on several agricultural products including tomatoes, cherries, nuts, and just this week a new application for an increase in the duty on flaxseed. While the farmers are making these requests, there is a growing demand from other organizations for lowering rates of duty on manufactured articles.

The increasing surplus in the Treasury, now estimated at well toward a half billion dollars, has created a situation which positively requires a revision of the federal tax laws. There will be tax reduction, the open question being at what point in the long involved tax schedule the big cuts will be made which will save some of the taxpayers a big part of the half billion dollars. The biggest effort for a special place in the reduction program is being made by the automobile industry which still bears a burden of the war tax on automobiles and accessories. They pass this tax along to every buyer of an automobile or auto part, and base their claim for special reductions in tax rate—or complete wiping out of their tax—on the fact that this will be a direct reduction to every purchaser and owner of an automobile, of which 22,000,000 are now registered in the U. S. The next most aggressive effort is in behalf of reducing the tax on corporation profits. These profits are now subject to a tax of 13½ per cent if they are distributed; but if not distributed, that is, held as surplus or undivided profits, are not taxed at all. This tax on distributed profits is held to be a very heavy handicap on small, active corporations such as make up the bulk of the business of the smaller communities manufacturing and merchandising, and which includes all of the butter manufacturers not co-operative. Other special interests which are presenting demands are the organization opposed to inheritance taxation which under the leadership of former Congressman Mondell is alleged to have collected a big war chest to fight for reduction, the Commercial Travelers who are trying to wipe out the Pullman surcharge and the theatres that are asking total remission of admission taxes. Then there is a political party controversy in the air between Democrats who demand greater exemptions and lower rates on all low bracket income taxpayers, and the Republicans who seem to insist on more uniform reductions for both low and large brackets of the income tax rate schedule.

Secretary of Agriculture Jardine has made the following statement relative to the Dairy Pilgrimage, under the auspices of the American Dairy Federation, to be held here April 26, 27, and 28.

"I shall be very glad to welcome the representatives of the Dairy Industry. The American Dairy Federation is doing a great service to the Department of Agriculture, and, I feel sure, to the dairy industry also, in bringing these men and women ere so that we can all learn at first hand what we can do to assist in the progress of this essential part of American agriculture. I should like to see many more such pilgrimages to Washington and to our Department."

The Bureau of Animal Industry lists something over 874 cities now having ordinances requiring T. B. test for all cattle supplying milk thereto. An inspection of these lists shows that there is a majority of those listed which are less than 25,000 inhabitants. Many of the cities so listed have changed from non-T. B. testing to T. B. testing in the last year or so. In one state there seems to have been nearly ten times as many cities with the test requirement as two or three years previously. This survey was started over a year ago, and completed after several months' wait. The changes are so many and rapid that plans are now being made for a survey as of July 1 this year, for the information of the next session of Congress.

"There is not a boy in this town as clever as my Charles!"

"Go on, how is that?"

"Well, look at those two chairs. My Charles made them all out of his own head, and he has enough wood left to make an armchair."—Good Hardware.

The Elevator Out and In

F. L. CLARK, IOWA

"HERE is no elevator business any more in this part of the country," said the owner of elevator in a Northeastern Iowa vn recently. "A couple of years a farmer drove a load of grain

Harry Kreg, assistant manager (left), d H. P. Schmidt, manager, have run the est Union elevator for five years and ve seen its business double in that time.

to our elevator. When I told him at I could pay for it, he shook his d as he stood on top of the load, l said, 'I can't do this any more. e got to bring my grain in on the f.' He has never hauled in anr load. The same thing has hapled with all our old customers. y are feeding everything they se, and selling it as butterfat, s, beef, and pork."

The same story is heard in hunds of towns in the corn belt. Eleors where, as late as ten and fifn years ago, lines of teams used wait their turn to unload grain, no grain at all any more. Some closed down. Many others are sale at a fraction of what they t.

Do these offer an opportunity to farmer?

At West Union, Iowa, it has turned that way. There, farmers own l operate an elevator which was d them for a song twelve years because the owner considered iness gone. Not a single car of in has been shipped out in over r years, yet the elevator is known one of the busiest places in West ion, and farmers think it is a real n to farm business.

t was in 1912 that West Union mers to the number of 175 orized a company and each put in) to pay for one share of stock. th the proceeds the elevator was ght for $1,700.

A year ago this elevator, whose busis was gone in 1912, did a business $339,722 under farmer manageent. It has no debts, and on March 1926, it had a sinking fund of 483.86 to its credit. Two or three usand dollars more were added this fund last March, for the npany doesn't believe in doing bus-ss on a shoe string.

A manager on a salary of $150 a nth with an assistant who is paid 5 a month are the permanent bus-ss force. Extra help is hired when ded. The company does business der the name of the West Union -operative Commission Company. is capitalized at $10,000 and its mer stockholders have grown from 5 to 200.

n the early years of farmer manement the volume of business was small, and about ten per cent had to be charged to take care of the overhead and build up a sinking fund. By increasing the business, it has been possible to reduce this charge to seven per cent. With the business growing every year, further reductions are anticipated, though never to a point where a substantial amount will not be earned to add to the sinking fund each year.

The elevator functions in several ways. It is a clearing house for the farmers. Rye, oats, wheat, barley, rape, timothy, clover, and soy beans are delivered by farmers to the elevator, but not for shipment. The grain which is brought in from farms where there is a surplus, goes back to other farms of the community where there is a shortage.

Farmers have found it convenient to have the elevator force handle shipping of live stock, since the stockyards are just across the railroad tracks from the elevator. This makes for economy in stock shipment.

The elevator is the farmers' buying agent. Feed, flour, oil meal, oyster shells, tankage, posts, twine, and bags are shipped in. When this buying was first instituted by the elevator the demand was so small that the company could not buy in carlots. Now the demand has so increased that no buying is done except in carlots, and the farmers have the advantage of this large saving in freight. The result is that because they can buy feed more cheaply, they are feeding more, and each year the elevator is shipping in more cars of feed. The more feed that is consumed on the farms, the more hogs and cattle there are for shipment. Business at the little co-operative elevator is working in a cycle. The more it does, the more it attracts and the better it is for the farmer members of the company.

Elevator of West Union Co-operative Commission Company at West Union, Ia.

On the Edge of the Range

HOARD'S DAIRYMAN:—The way in which western farmers are turning to milking is interestingly shown in the case of the Burwell Butter Factory of Nebraska. This co-operative concern is located in a town of about 1200 people on the edge of Nebraska's famous sandhill range country. It buys cream, eggs, and poultry, and ships in a small amount of fruit for sale to its patrons.

In 1922 the factory bought from the farmers 23,179 dozens of eggs and made 136,720 pounds of butter. The past year it handled 74,352 lbs. of live poultry, 49,478 dozens of eggs, and sold 239,986 pounds of butter, which is a substantial increase in all departments. This factory follows the practice of always paying the same price for fat as the seven competing cream stations pay. The past year they also paid back to the farmers 6c per pound rebate on all butterfat purchased, making their total rebate payment $11,970.

The real lesson in the history of this creamery, however, is found in a study of the rebate checks which Manager R. E. Brownell showed me. The farmer who secured the largest rebate check—for $260.98—has done so for the past four years. In 1926 he sold 4,350 pounds of butterfat, "and that man is milking close to forty cows," Mr. Brownell said. Another farmer who stood second and sold 3,474 lbs. of fat has only twenty cows on his farm, and they are all Shorthorns. Very few cows of dairy breeding are in the herds that supply this creamery with fat, though dairy bulls have been purchased in the past three years. Many of these cows run in the stalk-fields with little grain feed and only sheds for shelter. I have seen farmers, twenty-eight miles from the railroad and on a small sandhill holding, milk twelve or fourteen cows and two of us could carry it all to the separator in one trip.

These men are but beginning to milk. On the smaller holdings they will continue and good breeding will replace the beef blood that is there now. They can buy corn at $25 a ton, cottonseed meal at $38, and alfalfa for $12. Pasture is cheap (as land can be bought from $10 to $100) and the weather is mild. Many days in January and February the writer went to his school and about the immediate country without topcoat or hat. In addition to these advantages they are less than 300 miles from Omaha, the largest buttermaking city in the world.

When sections of this nature turn to dairying in earnest, the farmers in regions of higher priced land and feed must cut production costs to compete.

Nebraska W. H. FORSYTH.

AMERICAN STEEL & WIRE COMPANY

Banner Posts give you exactly what you have always wanted in good steel fence posts—great strength, easy attaching of line wires, firm anchorage, long service.

Banner Steel Fence Post GUARANTEE

All Banner Steel Fence Posts are made of railroad rail design with heavy backbone reinforcing. They are made of NEW STEEL and are GUARANTEED to give the equal of or longer service than any other steel fence post of same weight which is used under similar conditions. Any buyer who will show that Banner Posts, purchased through his dealer, have failed to give this service will be supplied by us with new posts, free of charge and without delay.

Ask our dealer in your community. His stock insures quick delivery.

American Steel & Wire Company
DEALERS EVERYWHERE

Other Sales Offices: Chicago, New York, Boston, Cleveland, Worcester, Philadelphia, Pittsburgh, Buffalo, Detroit, Cincinnati, Baltimore, Wilkes Barre, St. Louis, Kansas City, St. Paul, Oklahoma City, Birmingham, Memphis, Dallas, Denver, Salt Lake City

1 Railroad rail design reinforced with a heavy steel backbone.

2 Easy to attach line wires. 7 clamps supplied with each post.

3 Large slit wing anchor plate anchors the post like a rock. Permits immediate fence construction.

4 Entire post protected with best quality paint made of pure linseed oil base.

Banner Steel Posts are not affected by frost. Your fence is grounded wherever a steel post is used and danger to your stock from lightning is greatly reduced. With Banner Steel Posts the fence line can be burned off every year, thus getting rid of weeds, insects and rubbish. The clean farm grows the best and biggest crops and with the least labor and expense.

Provoked Customers Don't Stick!

DO you make your dairy customers pry and gouge old style caps off the bottles that carry your name? That is no way to hold customers. Give them bottle caps that are easy to lift.

Certified Caps for milk bottles have flaps made of tough, red fiber. They are easy to see and to grasp. They lift off the caps easily every time. They're stapled on to stay. They are distinctive. A mark of better service in hundreds of dairies that are making new customers every day.

The extra cost of Certified Caps with Red Flaps is small—far less than the extra profits they bring. Make us prove that.

Write us or ask your supply house for free samples, either for capping machines or for hand capping.

How many cows do you milk?.....

WHAT PRICE MILK

WAYNE DINSMORE, Secretary Horse Association of America

NEW YORK distributors in 1925 delivered to their patrons an average of 4,311,800 quarts of milk daily. In 1917 their average daily deliveries totaled 1,600,722 quarts. Cost prices in the decade went up also; in 1916 a quart of Grade B milk cost the consumer nine cents; in 1925 he paid 15 cents for it.

The dairy industry has grown to be highly specialized. Milk comes into the metropolis from six states: New York, Pennsylvania, New Jersey, Vermont, Massachusetts, and Connecticut. It is unloaded at ten terminals.

The transportation of milk from the farm to the city dealer is either direct by truck or by truck to the country receiving station and via railroad to the city, whence it is transported by tractor-truck, truck, or wagon to the pasteurizing plant or distributing station. Very little milk is brought into the city by truck, because the distance between producer and distributor is so great. The railroads transport 98 per cent of it.

READY FOR THE DAY'S WORK

In some instances the distributor owns the trucks that collect the milk from the farmer, although generally men are hired to collect and haul the milk by truck to the station, operating over a definite route schedule and serving a certain number of customers. Compensation is based on the hundredweight and ranges from five to fifty cents per hundred pounds, depending upon route conditions. This is paid by the consumer.

The dealer performs an exacting role in the distribution of milk, overcoming many obstacles in making his deliveries each morning, regardless of the weather. Usually he is required to maintain cooling stations in the country for receiving milk from the farmer. Upon its arrival at the terminal in the city, it is unloaded on to large receiving platforms by railroad employes, or direct on to the distributors' vehicles for conveyance to the city pasteurizing plant, distributing station, or direct to the consumer.

In case the distance to the plant is short, bottled milk is sometimes carried in large wagons pulled by four-horse teams, hauling from 250 to 300 cases of milk or cream. At the plant the team is transferred to an empty wagon and sent for another load.

Two kinds of power figure decisively in the plant-to-pantry distribution of New York's milk supply—man power and "flesh-and-blood" horse power. Between 1:30 and 5 a. m. the horse is backed into the shafts and horse and driver set out upon a circuitous journey of streets, alleys, and boulevards to get milk and cream upon the doorsteps of the four million homes before the family awakens to a desire for breakfast. This delivery is generally completed by 7:30 a. m., and in Greater New York is accomplished entirely by horse-drawn vehicles, which experience has proved to be most economical and efficient.

The collection of bottles, payment for milk, and the return of empties to the plant usually consume the remainder of the time between 7:30 and 10 a. m. or 12 noon. On Mondays and Tuesdays, when cash collections are made, some wagons are out on their routes until 3 to 5 p. m.

The delivery of milk to stores—"loose" milk—is generally made between 4 and 9 a. m., and in this trucks share with horse-drawn vehicles. Payment is collected daily—at time of delivery if the store is open; otherwise, on return trip to the plant. As a rule, the collection of bottles and moneys from stores requires almost as much time as the delivery of milk, but storekeepers could reduce this time by giving the milk salesmen prompt attention.

It is true that in some sections, notably in lower and upper East Side of Manhattan borough, the stores handle large quantities of "loose" milk. People in these sections are too poor to buy the more sanitary bottled milk and come to the store bringing their own containers for the eleven-cents-a-quart "loose" milk.

Retail milk salesmen are generally paid $35 per week, plus two per cent commission for six days per week work. Wholesale bottled milk salesmen receive $37 per week, plus two per cent commission for six days per

"Hello!
FISK BOY TALKING"

The New Fisk Extra Heavy Balloon is the greatest tire ever built.

This tire is in a class by itself for appearance, mileage, safety and satisfaction. It is the outcome of the Fisk effort to improve tires that have won a reputation for quality and long life.

With its unusual strength and its size, the New Fisk Extra Heavy Balloon is the easiest steering balloon tire on the market today.

Tell the local Fisk dealer you want to see it.

The Fisk line is complete and includes a tire for every road and load condition and at a price to meet every purse.

EXTRA HEAVY
BALLOON

eek work. Wholesale "loose" milk lesmen receive from $41 to $45 per eek in salary and sometimes a com-ission. In addition, the salesmen e sometimes paid a bonus.

The system of paying salary plus mmission may not mean that the lesman receives a greater total mpensation but the practice is to commended, because the sales-an's earnings depend upon his own ility and efficiency as a salesman. he welfare of his employer is his n welfare.

Salesmen of retail milk are allowed grant one week's credit to their stomers, making their own collec-ons. In some cases payments are ade once a month. Distributors, wever, frown upon the 30-day edit plan and a request for more an one week's credit is usually re-rred to a credit manager.

Critics of present methods of dis-ibution are wont to refer to the utes as inefficiently managed be-use every wagon does not carry a pacity load. The amount of milk ld per route usually depends upon rcumstances outside the control of ther distributor or salesman. The rgest sales are made in large ele-tor apartment house districts, the west sales in "walk-up" apartment, scattered-individual, house dis-icts. There is a limit to the num-er of stairs even an energetic sales-an can "do."

New York distributors at different mes have tried to increase the load r wagon by putting a helper on ch wagon. It was necessary to ake the salesman responsible for e work of his helper, and salesmen jected to this. Mistakes were more equent, losses greater, salesmen ss efficient. These things counter-lanced the reduction in horse and agon cost and the practice was andoned.

Milk is the most regularly pro-ced and consumed food commodi-. Milk production is a daily job erywhere the year around, Sun-ys and holidays included, though e consumption of milk is more gular than the production. Pro-ction, ironically enough, goes up consumption begins to wane. The nited States government report for ay, 1926, shows that consumption aches its peak in June each year, clining from then until low ebb is ached in December. Greatest pro-ction of milk is achieved during e summer season as the result of tural causes. Some provision must made, therefore, for utilizing the erproduction, to insure an average ofit to the producer.

Fluctuations in consumption are ought on by such things as heat aves, thunder showers, holidays, eek-ends—and the producer has to prepared for them, either with ad-tional quantities of milk available, with facilities for taking care of a rplus rejected by patrons. Over a riod of five years in New York it as found that the amount of surplus ilk totaled 582,945,000 lbs. per ar. Surplus, of course, is utilized far as possible in the manufacture butter, cheese, and other salable oducts.

The table on preceding page, taken om the report of the New York ayor's Committee, 1917, shows what e loss due to surplus milk amounts Such unavoidable losses, ranging om .0015 to .01572 cent per quart, d materially to the cost of distribu-n.

The chart shows the amount of oney which would have been re-ived had the surplus of 582,945,-0 lbs. been made into butter from per cent cream and had the but-and skimmilk been marketed.

Milk sold in New York City must be pasteurized, and this also adds to the expense of distribution.

A distribution of the cost of a 15-cent quart of Grade B milk in New York City is as follows, according to government report:

	Per quart
The farmer	$.06
Cost of operating country receiving station	.008
Freight 200 miles to city	.011
	$.079

As the milk arrives at the city terminal, leaving a spread of approximately $.07 from terminal to consumer:

	Per quart
Trucking from terminal to city pasteurizing plant	$.005
Pasteurizing plant expense	.015
Trucking from pasteurizing plant to retail sales branch	.006
Retail branch cost, including delivery to doorstep	.042
Company's net profit	.003
Total	$.15

This distribution gives an idea, too, of how many persons must handle the product between the time the chore boy sets out with his milk pail and three-legged stool for the milking shed and the time the horse halts before a bungalow of the suburbs and the driver sets a bottle of gleaming white milk upon the steps.

No food of equal nutritive value is purchasable at a price as low as that of a quart of milk. The value of milk, in relation to the value of other food commodities, is as follows:

Milk at c a quart	As cheap as Sirloin steak at c a pound	Eggs at c a dozen
7	16.3	17.6
8	18.6	20.1
9	21.0	22.6
10	23.3	25.1
12	27.9	30.2
16	34.9	37.7

The following prices and percentages for foodstuffs, taken from the Bureau of Labor Statistics, show that the price of milk has increased 66.66 per cent from 1913 to 1926, while the average increase of the eight food commodities is 81.32 per cent. While milk has increased in price from 9 cents to 15 cents, it is still 14.66 per cent below the average for the entire group:

	1913	1926	Increase
	cents	cents	per cent
Steak	23.8	42.5	78.57
Bacon	23.6	50.6	114.40
Milk	9.0	15.0	66.66
Butter	41.2	53.6	30.09
Eggs	31.8	49.5	55.66
Bread	6.0	9.6	60.00
Potatoes	2.3	6.2	169.56*
Coffee	27.5	48.3	75.63
Average increase			81.32
Milk increase			66.66
Milk below the average			14.66

*1926 price has dropped since above calculations.

The Last Word in Modern Barn Equipment

SPECIAL PRICES GLAZED STONEWARE WATERBOWLS, and SALT and MINERAL FEEDERS. This sanitary equipment is guaranteed against breakage by cows, and is very practical and efficient. Highly ornamental. No expense has been spared to make these goods the best that human skill can produce, regardless of price. We fit any make equipment, and sell direct where no dealer. Phamphlet and information free. SALESMEN WANTED. Inquire IDEAL SALT FEEDER CO., Morristown, Minn.

VICTOR DAIRY PASTEURIZER

for the FARM DAIRY and SMALLER PLANTS

REALIZING the need for a simple, efficient and economical milk pasteurizing outfit for smaller plants and farm dairies, *CP* offers the Victor, illustrated above.

The outfit consists of a combined heater and holder, sanitary pump and Alaska cooler. (Bottle filler is not included, but can be supplied at extra cost.) Operation is simple and conforms with all state health boards' requirements.

With a Victor Outfit the small dairyman can produce good, wholesome pasteurized milk just as cheaply and efficiently as the big city dealer. Pasteurization provides safe milk and will increase your business. The Victor is a business builder. Write for full information and prices.

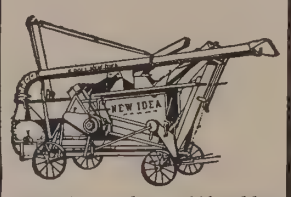
The Foundation of All Spreader Value

FORTUNATELY for the farmer, there has been *one undisputed standard of spreader value*—for the past twenty-eight years! Step by step, whenever improvement was possible, the way has invariably been shown by

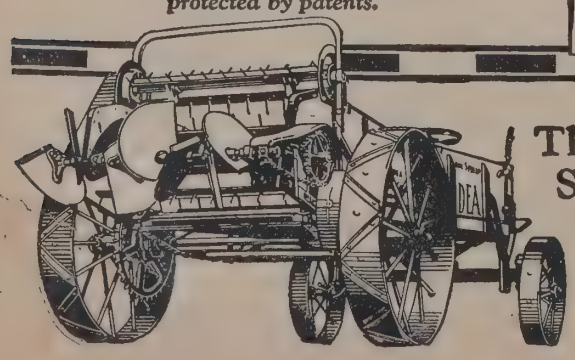
NEW IDEA Spreaders

No matter what the point in question—efficiency, durability, simplicity, ease of handling, light draft, ease of loading, perfection of dealer service—the very foundation of all spreader value is contained in the NEW IDEA. Starting as an *original invention*, the NEW IDEA has steadily maintained both its originality and its leadership—establishing an unbroken record of success.



NEW IDEA dealers are easy to find. They constitute a service army, itself of tremendous value to the farmer. Go to the nearest one and let him show you the up-to-date Model 8. You will understand why NEW IDEA users remain steadfast in their loyalty.

All New Idea products are fully protected by patents.



New Idea Transplanter

All New Idea products are noted for their *practical originality*

Largest independent spreader factory in the world. Not in any trust or combination. Over 4,000 agencies. Branches everywhere.

Pastures Stimulated by Sulphur

H. B. HOWELL, OREGON

FIFTY pounds of sulphur fertilizer per acre has increased the carrying capacity of my irrigated white clover and bluegrass pasture 300 per cent," said a real dairy farmer to a group of listeners. Sulphur as a fertilizer for alfalfa and clover hay crops has become an established practice over much of the Pacific Northwest, and reports of increased yields of from 50 per cent to 100 per cent as a result of using 50 to 100 lbs. of crude sulphur per acre are very common. However, the use of sulphur as a fertilizer for pastures of white clover and bluegrass is a rather recent innovation that has given astounding results.

Ed. H. Allen, dairy farmer, who lives near Grants Pass, Oregon, has long been a booster for irrigated pastures of white clover and bluegrass, and among his neighbors has the reputation of having some of the best pastures in the community. But he was not satisfied, and began experimenting with fertilizers to improve his yields, and remembering how the legume hay crops in his section responded to the use of sulphur, tried out one part of his pasture with sulphur at the rate of 50 lbs. per acre. This was broadcasted by hand about February 1st, and the trips across the field were made at intervals of si paces.

Imagine his surprise as the seaso advanced, in noticing dark strips o higher growth across the field as i indicated in the accompanying photo graph. It was some time before M Allen really remembered that pe haps in broadcasting his trips acros the field had been too far apart, an that some of the area had really re ceived no sulphur. Careful checkin revealed that these darker and faste growing strips were just where h had walked in broadcasting.

The unfertilized strips showed tha the white clover present was makin practically no growth and there wa a tendency for the bluegrass to be come "sod bound," while on th strips fertilized the white clover wa three to four inches tall and blue grass in proportion, in spite of th fact that the herd of dairy cows wa on it at the time.

Irrigated pastures are developin very rapidly in the Grants Pass terri tory, as they are in all of the irri gated section of Oregon, and th news of Mr. Allen's pasture soo spread so that one day late in Jul the pasture was visited by 125 farm ers who were out on a "crop tour conducted by the county agent. I was at this time that Mr. Allen mad the remark credited to him above.

WHAT SULPHUR DOES

A demonstration of what applications of sulphur did on white clover pasture on the farm of E. H. Allen of Oregon.

Milk Stool Philosophy

J. J. SPRENGER, MINNESOTA

HALF of this world has a big supper and no appetite, while the other half has a big appetite and no supper at all. One of our great blessings as a people is in the fact that we need not know what poverty is. But while we have no poverty, we do have a feeling which is akin to poverty and that is the feeling that we are not getting our just share of reward for our work.

Strangely, too, this feeling of inequality seems to become worse instead of better as our general prosperity increases, so it really seems that dissatisfaction is the result of prosperity as often as it is the result of hardship. The most contented people it was ever my lot to meet were the early settlers who had the least to do with. The unhappiest people are often those who have the most.

But how do we get equality in life and what must we do to get what is coming to us?

There have always been those who believe we must have organizations and laws to prevent the rest of the folks taking or diverting the things we think rightfully belong to us. Ye there are still those who believe tha one of the fundamental principles upon which this universe is run i that in the end true efficiency is al ways rewarded. We may expect t secure help in both ways, but as soo as we become chiefly interested i getting our own instead of doing ou best it always weakens us, whil brooding over inequality is sure t weaken us.

Evidently economic laws have thei own leveling tendencies, but they are not well understood and are therefore mistrusted. I believe that in life the man who works the most does not al ways earn the most, but the man who works the most always accomplishes the most.

Yet I suppose that for all time to come the mass of men will worry themselves into nameless graves while a few great souls forget themselves into immortality.

Judson P. Mason

J. P. Mason, a prominent dairy farmer of Kane County, Illinois, died at his home Saturday, March 12. Mr. Mason was born March 31, 1850, on the farm which he operated all his life. He was not only a successful dairy farmer but devoted much of his time in assisting to bring the dairy industry upon a sound basis. To this end, in later years particularly, he gave much of his time in attending dairymen's conventions and farm institutes. His talks were always sound and they gave much encouragement to those who were looking for light.

One of the things he emphasized for successful dairying was quantity

JUDSON P. MASON

production. As a young man he comprehended that no money could be made with a poor cow or by producing only a small quantity of milk. He invariably discussed milk production by the acre and that in order to get a large yield per acre the right kind of feed must be raised and the right kind of cows kept to eat it. He was not satisfied with a herd unless two cows produced daily at least 68 lbs. of milk. One can of milk for each two cows was the standard he set and one that he reached in the later years of his dairy work. He usually kept about fifty cows and unless his wagon carried away twenty-five cans of milk each holding 68 lbs., he considered himself falling down on the job. He grew well-to-do and followed no other occupation but that of a dairy farmer. He considered farming the best business in all the world and he received the greatest satisfaction by being able to bring about forces which would make his farm operations profitable.

High Testing Seed Corn Scarce

HOARD'S DAIRYMAN: — The year 1926 was a trying one for seed corn and under the best possible conditions corn is running a little lower in test than in previous years. However, corn that will give 90 per cent or above is considered good and can be readily purchased with the expectation of giving a good performance when planted a little heavier than usual. Where planter drops 42 inches apart between the hills, it is well to use planter plates that will drop 4 to 5 kernels to the hill. If drilled, the corn should be dropped seven to eight inches apart in the drill row.

There is no real advantage in planting while the ground is yet cold and out of condition. However, every farmer should plan so as to get on his corn field just as soon as machinery and team can be placed thereon without difficulty. The early disking and dragging of the ground will do much in the way of sprouting weed seeds and warming the ground so that corn can be put in under best conditions. Corn is very sensitive to chilled conditions of the soil and farmers make a great mistake who attempt to leave their corn fields until just about the time they desire to plant the seed. It is extremely hard to get the ground in good tilt after it has become baked on the surface and is out of general good condition.

There is also another advantage by getting the land in condition several days before planting the corn and that is there will be more available fertility in the soil if it has been worked a few days in advance. Fields that are planted in this way usually gain from a week to ten days over fields that are just cultivated and put in without previous preparation. In years such as we have been having, it means a great deal as to whether a field will mature eight or ten days earlier than the general average of corn fields. This is particularly true of those who make it a business of putting up more or less seed. Now is the time for farmers to begin to secure and test their seeds and get their farm implements prepared for rapid use in the early spring.

Wisconsin. R. A. MOORE.

An Iowa Creamery

The annual report of the Littleport Farmers' Co-operative Creamery Company of Iowa shows that the average price received for butter shipped during 1926 was 44.5c. The cost of manufacturing butter was 2.886c and patrons were paid an average of 49c a pound for fat delivered to the creamery. The overrun was 22½ per cent for an average cream test of slightly over 30 per cent. The creamery received 241,368 pounds butterfat for which it received a net income of $126,383. Fifty-three of the 120 patrons received in excess of $1,000 each for cream delivered.

NASH

Leads the World in Motor Car Value

The New Style in Body Design

and Featuring a 7-Bearing Motor

It is emphatically apparent today that Nash has created a new era in American enclosed body artistry with this distinctive body design.

With its new gracefulness, its beautiful French-type back and French roof design, and its rich array of costly car features, the new *Special* Sedan pictured above possesses magnetic appeal for those most keenly appreciative of motor car style and quality.

The steering wheel is of real walnut in fitting harmony with the walnut finish of the inside window mouldings, door panels, the instrument board and the crowned panel above.

The upholstery is genuine Mohair Velvet, deeply tufted. And Nash powers it with the big 7-bearing motor—*the world's smoothest type.*

So that in supreme power-*evenness* and *quietness*, and lightning-fast "pick-up," and in easeful roadability on the straightaway or climbing, together with a world of speed, it stands out as the most notable car of its field.

As standard equipment there are Gabriel Snubbers at front; 4-wheel brakes, of special Nash design, with the front wheel brakes completely enclosed for safety's sake; and five disc wheels.

And the price is set at such a moderate figure as to be agreeably surprising.

A large *Special* Sedan on the Advanced Six Chassis, reflecting the same unsurpassed quality throughout, is also offered at a most favorable price. (5371)

"VAN'S EVERGREENS"

Our Stock is of the Choicest Quality and Our Prices Will Please You

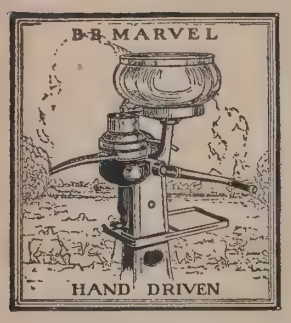
more EMPIRE Milking Machines

than any other make—why?

WHEN a national farm paper recently asked its readers whether they owned milking machines and what they thought of machine milking, *more reported owning and preferring Empire Milking Machines than any make listed.*

Why? In letters to us, farmers have said:



"Cows are less nervous and give more milk per day, for more days, when they are Empire-milked."

"One person can milk more cows in less time with an Empire than two or three expert hand milkers."

"Cows keep healthier and milk is cleaner."

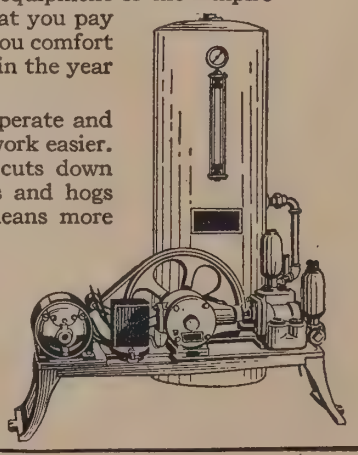
"The wages and keep of a hired man are saved by the work an Empire Milking Machine does."

"It makes dairying a pleasanter, more profitable, better business."

Sold on easy payment plan. Send for booklet—mail the coupon today.

New B B Marvel Cream Separators—More Cream without More Cows

The improved, permanently balanced bowl of the new B B Marvel gets extra cream from every can of milk—more cream without more cows. It gets all the cream all the time. The bowl does not vibrate nor tilt because it is mounted on an automatically oiled ball-bearing spindle, supported by a stationary shaft. It has no neck springs nor bushings to wear out and cause trouble. It skims cleaner and lasts longer.



When you run the skim milk from any other separator through a B B Marvel you too will want the extra cream. See a B B Marvel in action. Sold on easy payment plan—a size for every herd. Mail the coupon today.

You can afford the Empire Water System

Complete motor, pump and tank equipment of the Empire Water System costs only about what you pay for a first-class radio set. It gives you comfort and saves time and work 365 days in the year —lasts a lifetime.

Costs about a nickel a day to operate and makes kitchen, laundry and dairy work easier. Provides bathroom conveniences, cuts down fire insurance costs, supplies cows and hogs with all the water they want—means more milk and heavier hogs.

The Empire Water System is easy to install, silent and automatic in operation, capacity 300 gallons per hour. Sold on the easy payment plan. Mail the coupon today.

EMPIRE MILKING MACHINE COMPANY
Dept. 1, 97 Humboldt St., Rochester, N. Y.

Raising Cross Bred Seed Corn

EUGENE KELLEY, IOWA

HYBRID seed corn of four inbred strains won the 1925 Corn Yield Contest in Iowa. It yielded seven bushels more to the acre than the highest yielding strains of Reid's Yellow Dent on the same land and under the same conditions.

Hybrid seed corn will be available for a limited number of corn growers in 1927, which marks a new advancement in this industry. Last year it was grown at a few places in Iowa on a commercial basis. The largest plot is that of J. J. Newlin. He had a forty-acre field planted with inbred strains. He carefully detasseled all the corn of one strain so that a complete cross would be made with the other. The corn produced on the detasseled stalks are the hybrids which are saved for seed.

The field which Mr. Newlin used to grow his seed corn yielded about 80 bushels to the acre. This yield is about a 14-bushel increase over the Krug corn which he had planted on the same field the year before, a far better corn year. Krug corn is one of the best yielding varieties of corn that is not a hybrid.

Experimental work has been done on crossbreeding corn for more than the last twenty years. Dr. D. F. Jones of the Connecticut Experiment Station is one of the pioneers in this phase of corn production. The Iowa Experiment Station started an extensive program in this field in 1922 under the supervision of M. T. Jenkins. Sixteen strains or varieties which were known to possess high yielding qualities were used for the experimental work. Ten to fifteen thousand self pollinations have been made annually on the college experimental plots, and 470 different crosses were made between the various varieties this season. A search for the combinations between the varieties or strains of corn that will give the highest yield per acre under average conditions, is the underlying object of all the experimental work being done on this subject.

To describe the work done in the crossing of inbred strains for the production of high yielding hybrids would require a very lengthy discussion. To make it as brief as possible I will explain the procedure that has been carried out by Mr. Newlin. Strains which possessed high yielding qualities were inbred by means of self pollinations to obtain strains that are pure and true breeding. Inbreeding causes the strains to decrease very rapidly in vigor; the plants become weak and spindling; and the ears are small and oftentimes susceptible to disease. After the strains were inbred for from four to eight years, they were crossed one with another on small plots which was done to restore the vigor. This is done by planting three rows of one inbred strain which is detasseled and one row of another inbred strain which

DETASSELING TO PRODUCE CROSS BRED SEED CORN ON THE NEWLIN FARM IN IOWA

furnishes the pollen. The corn produced on the detasseled rows is a cross between the two inbreds. The seed corn from this first cross is very high yielding, and in most cases will outyield the strains from which it was produced by a good margin. But this seed is not practical because the expense of growing it is enormous. To lower the cost of production Mr. Newlin made another cross on another plot with two other inbred strains. These first hybrids of inbred strains were again crossed the next year which produced a hybrid of a double cross. "This seed is the hybrid that won the 1925 Yield Test," Mr. Newlin said.

In the field where Mr. Newlin had his high yielding hybrid corn planted, I noticed many outstanding features that this corn possessed. The plants were all vigorous, large, and thrifty. Every stalk had a good sound ear, free from disease. The uniformity of the ears was remarkable, and the stalks were all standing erect. In one field Mr. Newlin had some of his hybrid corn planted next to a strain of

SEED CORN DRYER

An oil burning furnace at the left sends hot air through a pipe into the bottom of these four cribs on the Newlin Farm in Iowa, and is said to be very efficient in drying corn to 12 per cent moisture in four days.

Reid corn. The stalks of the Reid corn had been partly blown over by the wind whie the hybrid corn was standing erect Many stalks of the Reid corn were barren, and many had produced only nubbins. On the hybrid corn every stalk had an ear, and the ears were practically uniform in size.

Mr. Newlin showed me his artificial seed corn drying plant. "I can dry 100 bushels each day with this plant and with less trouble and expense than the rack method," he said. The moisture of the seed corn is about 35 per cent when it comes from the field, but by the use of this plant Mr. Newlin is able to lower it to about 12 per cent in four days, which makes the seed more than safe from freezing weather. The heat furnished for the drying comes from an automatic oil-burner furnace. The hot air at not more than 110 degrees Fahrenheit is blown through the corn which is in bins. The quick drying seems to have an added advantage in the killing of diseases before they can affect the germination of the seed. After he installed his drying plant Mr. Newlin said that his corn showed a germination of 100 per cent as compared to 60 to 80 per cent that he obtained in 1925 when using the rack method.

The tests so far have shown that this hybrid corn the first year will give a much larger yield than the ordinary seed corn, but the corn seed gathered from the hybrid corn will not continue to yield well. Hence, each year the farmer will be compelled to buy new hybrid seed if he wishes to maintain high yields.

Farm Tax Exemption

HOARD'S DAIRYMAN:—Dairy farmers in Georgia will receive exemption from taxes for a period of ten years if legislation now proposed is passed by the 1927 state legislature and ratified by the people.

The plan, which originated with the Atlanta Chamber of Commerce, and which has the approval of Eugene Talmadge, state secretary of agriculture, and other officials, is to give tax exemption for ten years on every improved farm not exceeding 100 acres in extent and not exceeding $5,000 in equipment value. Farmers with larger holdings and absentee landlords will not be exempted nor will holders of unimproved lands.

Those interested in the proposition claim that it will help to solve several serious farm problems in Georgia. In the first place, it will tend to break up large and unworked holdings, for the absentee landlord will be taxed more heavily and the small farmer will get off tax-free under the plan.

In the second place, it will help to solve the age-old problem of the tenant farmer, for many holders will break up their large plantations and tenants will be able to secure land of their own on very reasonable terms.

And in the third place, it will help to re-populate the abandoned farms of the state, which is the most serious problem with which Georgia agriculture is at present confronted. Leaders in the state are very anxious to get experienced live stock farmers from the North and West not only to take over the farms left by cotton planters but to serve as demonstrators of successful methods in dairying and live stock. They realize that a transition must be made from all-cotton planting to diversified farming, including live stock production, and that this is going to be difficult without the presence in each community of experienced live stock farmers to lead the way.

Thus the proposal offers something more than mere relief from taxes for the farmer. It offers a practical solution to at least three serious farm problems. If the measure, which is now being drawn up by a special committee, is passed and later ratified by the public, a fund of $50,000 will be provided with which to advertise Georgia throughout the North as "the state without a tax on farmers" and it is expected that thousands of farmers will be induced thereby to move to Georgia.

It is estimated that the tax exemption will cost the state $750,000 in taxes out of a total of $23,000,000 collected, but it is pointed out that the increase in the number of farmers and the products produced will repay this loss many times over. At any rate, this is a practical way of offering relief to the dairy farmer and of solving the principal farm problems at the same time and as such it merits attention.

A book-load of ways to save money on rope...*Send for it — now!*

Do you know how to make the *best* knot or hitch for every job on the farm? How to save rope by splicing; how to save time by making knots easy to untie; how to care for rope?

All these things are fully described in our new 58-page illustrated booklet, "More Jobs from the Same Rope."

It gives, in attractive, convenient form, a host of ways to make rope last longer and work harder—two of the surest methods of saving money on rope.

Send for this valuable book —*now*! Mail the coupon at the bottom of this page, with 15c—a mere fraction of the book's cost. Your copy will be sent at once.

How to know good rope before you buy it

The better quality your rope is to begin with, of course, the greater will be your saving. Here's a sure way to know really *good, long-wearing* rope, before you buy it:

Untwist the strands of the rope. If you find a blue thread marker—the "Blue Heart"—running in the center between the strands, you may be sure that the rope is genuine H. & A. "Blue Heart" Manila Rope.

Spun by rope makers with over half a century's accumulated experience, this thoroughly good rope will wear longer and deliver maximum service in any size, on any job. For the selected fibres of H. & A. "Blue Heart" Manila Rope are drawn, spun, laid, and properly lubricated so as to insure the smooth working of every fibre, yarn, and strand.

Before you buy rope, untwist the strands and look for the "Blue Heart"—our registered trade mark. It assures you of dependable rope value not only on the first purchase, but whenever you need more of the same kind.

The Hooven & Allison Company

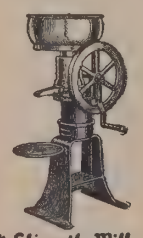
ONTARIO IRON WORKS, Box 287 **PULASKI, N. Y.**

A scene sketched from a photograph taken on the farm of Charles Scothan, Lee Center, N. Y.



This Pulsator Gives Teats *Complete* Rest Between Sucks

It Milks the Cows Clean

"During my long experience with the Burrell Milker, my cows' teats and udders have kept in excellent condition. I believe this is mainly due to the way in which the Burrell Pulsator gives complete relief to the teats between pulsations."—Charles Scothan, Lee Center, N. Y.

NATURAL circulation is essential to keep the teats and udders of your cows in good condition. A long period of suction, without complete relief, causes congestion, and teat and udder trouble. Nothing except *complete* relief is safe.

It Skims the Milk Clean

For many years, the wonderful Link Blades of the Burrell-Simplex Cream Separator have made it famous as the *closest skimmer*. It has a greater capacity for the size of its bowl, for the speed at which it is operated, and for the power required to run it than any other separator. It is simple, light and easy-running. But, above all, *it skims the milk clean*—and that's what you want in a cream separator. Four sizes—350, 500, 750, 1000 lbs.—hand or power driven.

Safeguards Your Cows

The Burrell Positive Relief Pulsator creates sharp, definite, positive, intermittent periods of *complete* relief. Between sucks, the vacuum in the teat cup drops completely to zero, the teat hangs free, and circulation is normal and natural. This feature of the Burrell Milker safeguards your cows, and it alone is sufficient to justify your choice of the Burrell Milker.

4 Exclusive Features

There are four exclusive features which make the Burrell the *perfect* milking machine. The first three are interdependent—each increases the efficiency of the others. (1) The *Automatic Controller*, which regulates the suction to suit exactly each individual cow; (2) the *Air-Cushion Teat Cup*, which supports and compresses the teats by air alone; (3) the *Positive Relief Pulsator*, which gives complete rest between pulsations and assures natural circulation; (4) the *Sanitary Moisture Trap*, which entirely prevents contamination from the pipe line.

The Burrell Milker is noted for its simplicity. It is a single tube system, with only half as many rubber parts as the ordinary type of milker.

Send For Valuable Free Books

Here are two valuable, illustrated books that are free to dairymen. One pictures and describes the Burrell Milker and explains how *"It Milks the Cows Clean"*. The other tells about the Burrell-Simplex Cream Separator—all about its simple, sanitary, rugged construction, and how *"It Skims the Milk Clean"*. Every dairyman should have both of these interesting, practical, helpful books for handy reference.

MILKING MACHINES AND CREAM SEPARATORS

Seasonable Live Stock Notes

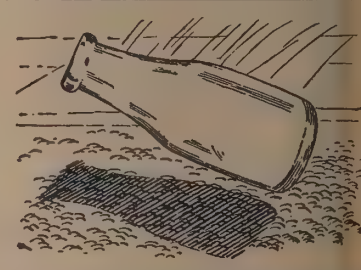
MANY a young horse has been knocked out for the season by a shoulder sweeny. The cause of some sweeny is purely accidental but many of them are not and so could have been prevented. Sweeny is more common among young horses that have not fully learned how to apply themselves under varying conditions. It is caused by ill-fitting collars, by hitches that cause uneven draft, by sudden jerks on the shoulder as when the plow strikes a root or stone, and sometimes by a hard blow from the tongue as when the front wheels of the wagon strike obstructions not at the same time. The characteristic symptoms are lameness, soreness, swinging the leg instead of lifting it, and the wasting away of the muscular parts over the shoulder blade. It takes a long time to restore a shoulder so injured to full usefulness. Prevention is advised above everything. If there is indication that a shoulder is about to become sweenied give the horse rest immediately. In the early stages if swollen apply cold water. Fasten a folded blanket over the part and keep it wet with cold water. Follow this by use of a good blistering liniment. Spanish fly, two or three drachms mixed with one ounce of lard, is good for this purpose. Vigorous rubbing of the shoulder is advised.

Getting the Best From Sweet Clover

How high should sweet clover be before cows are turned in to graze? The answer depends on how many cows are to be grazed on a given acreage, on how good the stand is, and on the growing conditions at the time and for two or three weeks after the cows are turned in. For example, if the acreage is as much as one acre for each cow and the stand reasonably good, one could turn in when the clover is not over four or five inches high. Another case where one should turn in when the clover is not over this high is when unusually favorable growing conditions prevail. If the acreage is as little as one-half acre for each cow or less it is advisable to hold the cows off until the clover is ten to twelve inches high.

If, for any reason, the clover is permitted to get more than twelve to fourteen inches high, the best quality and greatest yield will not be obtained. Getting the greatest yield of good feed from sweet clover requires some experience and close observation on the part of the herd owner. Many farmers have lost the best part of a sweet clover pasture by letting the growth get too far along.

Pasture Alone Not Enough for Young Calves



Mistakes are frequently made in growing dairy calves by forcing them to pasture alone as the only feed at too young an age. Not only has the calf not learned to graze large quantities of grass but also its digestive system has not been developed to take care of as much bulk as is required when grass alone is fed. Young calves should be continued on skimmilk, hay, and grain until they are 4 to 6 months of age. When they are turned to pasture at this age the grain and hay should be continued for a month or so until the calves learn to adjust themselves. There is no harm in continuing the feeding of skimmilk in diminishing amounts. To successfully switch dairy calves over from winter feeding to pasture is no job for an amateur. Within the next month the question of what to do with the calves must be answered in one or another.

Save One-tenth of the Pig Fee

The most important thing r now in the management of swin to keep the young pigs and t mothers out of the hog lots that badly infested with worm eggs disease germs. Last year on e farms in an Illinois county where sanitary practice was used, 100 of pork were made from 399 lbs grain and other concentrates. eight other farms in the same co where the pigs were raised the style wormy way, it took 501 lbs grain and other concentrates to m 100 lbs. of pork. If losses f worms and necro have been exp enced during the past few years young, susceptible pigs are turned to the same yards this spring, the no reason to doubt that this ye pig crop will become infected. ing one-fifth of the feed is good for keeping the pigs clean.

The "Cheep," "Cheep" of the B Chick is Here

Baby chicks are now arriving farms by the thousands and them important responsibilities their care and feeding. When stop to think that an egg may laid in one state, shipped to anot state to be hatched, and the yo chick then hustled into a box sent several hundred miles into other state to be mothered, is it wonder that things sometimes

If it Doesn't Break ~ You can bet it's a THATCHER Bottle

THATCHER Superior Quality Milk Bottles are scientifically constructed to stand more rough treatment than any other milk bottle made. The use of only the purest flint glass, perfectly tempered in lehrs, used by Thatcher exclusively, makes Thatcher Bottles stronger, tougher and more uniform in quality than any other milk bottle made. Actual experience of dairymen and our own tests have definitely proved that Thatcher Bottles give "more trips per bottle" than any milk bottle on the market. Thatcher Bottles are tough and hard to break. Our Trade Mark is blown on every Thatcher Bottle for your guarantee and protection.

Posters for advertising bottled milk are supplied free to dairymen who will use them on their wagons. Several Thatcher factories assure prompt, efficient deliveries. Write today for more information and prices of Thatcher Superior Quality Bottles.

THATCHER
Superior Quality
MILK BOTTLES

ong? The marvel of it is that t re is great chance for success if t right things are done at the right t e. Brooder stoves should be set u and operated before the chicks a ive to make sure that they will d the work satisfactorily. The b oder house should be thoroughly c aned and disinfected. A supply of s table feed must be on hand when t chicks arrive. After they are p ced in the brooder house under t hover it is wise to "stick around" a l see that they stay in the right p ce. Close attention for the first f r days is essential if the risk from l s is to be reduced. Yes, thousands o chicks are arriving. Are you ready f them?

Feeding Cows Grain on Pasture

The question of feeding grain to c rs on pasture is timely. Under w at conditions is grain feeding p fitable? This question opens the h rt of the problem. Before answer- i it let us agree on the possible b efits derived from supplementing p tures. There are two of them, in- c ased production and better con- d ion of cows for their next lacta- t n. Both are important. A slight i rease in milk from feeding grain d s not necessarily mean that it is t profitable. The return for this g in will likely come back in the s ceeding lactation because of the b ter condition of the cows.

There is a wide range in quality a l quantity of pasture offered cows. T ere is a wide range in the ability o the cows to turn feeds into milk. G od cows cannot make a lot of milk f m poor pasture. Poor cows can- r make a lot of milk even from g d pasture. In theory it is easy t suggest that poor pastures be r de good and that low producing c vs be eliminated. This is sound p ctice but it cannot be done over n ht. As between poor pasture and g d pasture it goes without argu- m nt, we think, that some grain must b fed to cows on poor pasture. The a ount fed is governed by the pro- d ing ability of individual cows— t their ability to turn feed into m k. With good pasture available it i doubtful if it pays to feed grain t cows not capable of producing o r a pound of fat a day. Cows b ter than this will usually pay good p ces for limited amounts of grain. I t all the return from summer g in feeding is put in the milk pail d ing that lactation. Some of it s ves to keep cows in better condi- t n than they otherwise would be in a l this value gets into the milk pail t following lactation.

Treating Potatoes for Scab

The hot formaldehyde method of t ating seed potatoes for scab, black r rf, and blackleg is now generally r commended in preference to the o l method which required more time. I at this method will control these d eases within practical limits is s own by some results obtained at v rious experiment stations. The t eatment was devised by Dr. I. E. J lhus of the Iowa Station in 1918. I Wisconsin, where many potatoes a e grown, the treatment has proved v ry effective. For example, a Wash- i gton County demonstration where a seed used was 61 per cent affect- ed with scab, it produced a crop that d only 1 per cent of scab after the s d was treated. At the Spooner b anch station seed that was 24 per c nt affected gave a crop with only 1 per cent scabby potatoes. At R ookston, Minnesota, untreated seed p oduced a crop that was 24 per cent s abby, whereas the treated seed s owed only 5 per cent scabby. A t ree-year test in the Kaw Valley of Kansas gave an increased yield of 41.6 bushels per acre for treated seed.

The method is simple. One pint of formaldehyde is mixed with 15 gallons of water. This is heated to 125 degrees F. and held at this temperature. The potatoes are placed in sacks in convenient amounts to handle and held in the water for 2½ minutes after which they are drained, removed from the drain, and covered with canvas for one-half hour. They are then ready to be cut and planted. After treating, potatoes should not be placed back in infected sacks or other containers.

"The word 'Wisconsin' applied to butter should be but another name for all that is excellent."—C. R. BEACH.

4-Wheel Brakes

Extra safety made possible by Engineering Leadership

The Whippet is the only light four-cylinder car regularly equipped with four-wheel brakes. Year after year at the National Automobile Shows the number of chassis shown with four-wheel brakes has been steadily increasing. In January, 1927, over 86% of those exhibited had 4-wheel brakes. The Whippet with 4-wheel brakes is more modern than any other light four-cylinder car.

In addition to this greater safety, you get fuel economy that no other light car can offer . . . and superior beauty of low graceful body lines . . . and more leg-room than in any other light car.

These features, plus many others, contribute to the Whippet's Engineering Leadership in the light car field.

"My Most Economical Farm Machine"

"MY Perfection Milker is just as good as ever" writes Lynn Bradford of Sparta, Michigan. "It hasn't missed a milking in the six years I have had it. As you know, I got it second hand—its factory number is 647. I should like to know if there are any older machines in use at the present time."

"The ten cows that I have had on test at the West Kent Cow Testing Association were high herd for both milk and butterfat—12100 lbs. of milk and 418 lbs. of fat. Four of them were first calf heifers. I also had high cow for milk and butterfat."

Mr. Bradford's Perfection was seven years old when he bought it second hand. So it is now going strong after thirteen years. Its cost of upkeep is practically negligible, "less than any other tool on the farm," and Perfection milking takes only a fraction of the time that hand milking takes.

The new sanitary teat cup has only two pieces. One pull and it's all apart. That's why the Perfection Milker is so easy to wash and keep sanitary.

Send for your copy of free catalog and the names of users nearest you.

Wayside Musings — Changing a Nam

JOSEPH S. MORRIS, WISCONSIN

ONE of the appealing and inspiring stories of the Old Testament of the Bible is the story of Jacob. Jacob is a very human character. He had not dealt fairly with his brother. Away from home and serving his uncle he more than meets his match in shrewdness. But Jacob is always the fighter, the man who fights for mastery, for victory; the man who does not give up his struggle for the thing he is after.

The years pass by and Jacob is headed back for the old home. He knows that he must meet the brother he had defrauded and we can imagine how this approaching meeting fills the mind of Jacob with doubts and misgivings.

And then he does the greatest thing any man can do—he gets alone by himself and fights the thing out. His sleep is disturbed by a wrestling match in which it seems that an angel comes and wrestles with him throughout the night. Jacob hangs on and as the dawn approaches the heavenly messenger would leave him. Not much! Jacob insists that he will not let go unless he gets the blessing he is after.

And so the heavenly messenger asks Jacob his name. Jacob gives his name which is supposed to mean "one that takes the place of another." The angel says, "Thy name shall be called no more Jacob, but Israel: for thou hast striven with God and with men, and hast prevailed." What a name! What a man! A man who came to have power with God and with man! A man who was unafraid; who fought his way through to the finish; who would not break before the mysteries of life; who would not admit himself outgeneraled in the fight; who held, "we fall to rise!"

Jacob's name was changed to suit his character. What if our names were changed to suit our character? What would be our new name? It is certainly a suggestive inquiry.

In men who are made of the right sort of stuff there is a constant struggle going on. Before the problems, and mysteries, and perplexities of life they demand the right to know. They will not take "No" for an answer; they will not be denied; they demand the fullest measure of self expression.

I confess that I am thrilled by such men. I know that they are often wrong. I know that they seem to be stubborn and bull-headed, but I admire them for their determination to make a place for themselves. The world's greatest victories have been won by such men and they have not always been men of greatest physical strength. Steinmetz, the electrical wizard, made a great place for himself in spite of physical hand The world's greatest victories not always been won by men have had the greatest educa opportunities. Sometimes, as case of Lincoln, the great ema tor, they have had to chisel thei cation out of the solid rock a went along. The great fact i they were determined to "get They would not be denied.

Our world is not a soft worl is a hard world. The conditio mand men of undaunted spirit mind reverts at this moment D. Hoard. A great idea ca him. It was made fun of. Oth sues than the main issue confr him but he held true to his c How right he was we now kno would be a great stimulus t farm youth of the land to rea life of Hoard by Rankin. We just this sort of thing to heart in times of struggle.

The faith of a man's life signed to help him interpret meaning of this struggle. Religio courages a man to hope, to pr dream, to meditate, to worsh pit himself against all oppositi make his character such that a name will not fit him.

Science is cold-blooded, impe al, unemotional. Its business describe what it sees, and ye fact that a man is concerned wi story that is hidden in the rocks not rob him of the capacity t the poetic beauty of the landsca

You and I will probably carr name received at baptism unt day we die but that name wi always mean the same thing. tion the name of one man and i thoughts of success, victory, co in the face of obstacles; mentio name of another and it spells d discouragement, pessimism, an both may have had relatively same starting chance.

I believe that there is a po value in hero-worship thoug need not have our heroes paint spotless saints. It does us good our lives full of the struggle of men to make progress. It is a tive tonic to feel the thrill o struggles of other men. It en ages us to dig in and see what of a "fist" we may make of lif

Right now, you and I are w the meaning of our names! do they mean? Are we inclin say, "I am too old; it is too la begin!" Let's not say it. It i years that count but heart and It is a glorious thing to fight on down to the last moment, and li all the more fun and thrill in it the fact that we would not be d Tired? Crippled? Defeated? on! Insist upon the blessing of life.

GLENCOE FARMERS' CO-OPERATIVE CREAMERY, MINNESOTA

Quality First — then Low Price —

but we never sacrifice quality to make a Low Price

Ask "*What Quality?*" as well as "*What Price?*"

There is an advantage in using Ward's Catalogue to look up every article you need to buy.

Because Ward's Catalogue is based upon Quality First—then Low Price.

The difference is that Your Satisfaction with what you buy at Ward's is always assured. And satisfactory service—long wear, more months of use—determines in the end the actual cost. Price is what you pay—service is what you get. By sacrificing serviceability, prices can be made lower and lower. At Ward's, serviceability is never sacrificed to make a low price.

How Ward's Low Prices Are Made and High Quality always Maintained

Ward's low prices are made by quantity buying for ready cash by one of the most skilled and expert buying organizations in the world.

Sixty Million Dollars in cash were used in buying goods for this Catalogue. The markets of the world were searched. Goods were bought by the thousand dozen, by the car load, to secure lower-than-market prices. Our prices are as low as any merchandise power can secure. But they are never lowered by reducing quality.

We do not use inferior leather for the undersole of a shoe to take fifteen cents off the price. We do not use tin where galvanized iron gives longer service. We do not use old reclaimed rubber in a tire where new rubber is required. This carefulness to maintain quality, to secure longer wear, is part of Ward's service to you.

Use Your Catalogue With Confidence in Ward Quality

For Fifty-five years, Montgomery Ward & Co. has sold merchandise that always *is what it seems to be*—merchandise that will stand your inspection and your use. For Fifty-five years we have done business with our customers in the full Spirit of the Golden Rule.

Your orders are shipped within 24 hours

Your orders will be shipped within 24 hours. That saves time. Besides, one of our seven big stores is near to you. Therefore, your letter reaches us quicker. Your goods go to you quicker. It is quicker and cheaper, and more satisfactory to send all your orders to Ward's.

Raising Calves on Minimum of Mi

ARIZONA dairymen, like many dairymen of other sections, have a difficult problem in rearing heifer calves to replace their herds because the demand for whole milk is such that its use for calves is prohibitive.

The value of skimmilk is recognized but the supply in that state is very limited. Because of this problem the Arizona Station conducted some feeding trials to determine whether calves could be successfully raised on gruels made from calf meals using a minimum of milk. The calf meals were mainly composed of feeds usually available in that state.

At first a calf meal was made of corn meal, alfalfa meal, wheat bran, linseed meal, blood meal, and ground bone meal but this was not successful because most of the calves were affected with scours. The meal mixture was changed and three lots of calves fed until they were 153 days old.

The calves were fed by three different methods. One group received a home-mixed calf meal plus a minimum amount of milk; a second group had a commercial calf meal plus a minimum amount of milk; a third group had the same calf meal mixture as the first group plus a more liberal amount of milk.

The home-mixed calf meal was composed of 2 parts corn meal, 4 parts wheat middlings, 2 parts oat flour, 1 part linseed meal, ½ part blood meal, 2-10 part ground bone meal, and 2-10 part salt. The gruel was prepared by adding 1 pound of the meal to 1 gallon of water at about 100° F. and stirred thoroughly.

The first group of calves was fed whole milk until they were 10 days old when the milk allowance was gradually reduced until each calf received 1 quart daily when 25 days old. Following this each calf received 1 quart daily until 35 days old when the milk allowance was gradually reduced so that the calves were entirely off milk at 40 days old. As the milk was reduced an equal amount of the gruel replaced the milk reduction. As soon as the calves would eat hay and grain they were permitted to do so. Good quality alfalfa hay and a grain mixture composed of 140 pounds wheat bran, 140 pounds rolled barley, and 50 pounds linseed meal were provided.

The second group of calves was fed the same as the group just mentioned except that a gruel made from a commercial calf meal was used instead of the home-mixed meal gruel.

The calves in the third group received a full ration of whole milk until they were 30 days old, after which the milk was gradually reduced one-half and continued to 60 days old, after which the milk was gradually reduced to one quart per head daily. This amount was fed to the close of the experiment. The home-mixed gruel, the hay, and the grain mixture were fed same as in the first group.

The average of feeds consumed and the average total cost of feeds to 5 months of age of the 3 groups are shown in the following table:

Group	Whole milk	Calf meal gruel, dry wt.	Alfalfa hay	Dry grain mixture	Feed cost
	Lbs.	Lbs.	Lbs.	Lbs.	
One	290.4	178.8	265.6	197.4	$22.16
Two	220.2	151.4	301.7	153.8	23.75
Three	645.8	104.3	291.2	235.3	31.35

The gains made and the feed cost per 100 lbs. gain of the calves i different groups are as follows:

Group	Birth weight	Weight at 5 mos. of age	Total gain	Gain per day	C 1 g 5
	Lbs.	Lbs.	Lbs.	Lbs.	
One	72.5	274.6	202.0	1.32	$
Two	72.3	267.1	194.8	1.27	
Three	71.4	317.9	246.5	1.60	

The gains made by these compare very well with what th mal growth should be as report Eckles in Research Bulletin N of the Missouri Station.

It was noted that the calve a minimum amount of milk di look as good at 5 months of a the calves fed more liberally of but these differences were les parent as the calves grew olde finally there was no difference i or general appearance.

The prices of feeds used in th periment were as follows: m cents a pound, home-mixed calf 3.5 cents a pound, commercia meal 7 cents a pound, dry grai cents a pound, and alfalfa hay ton.

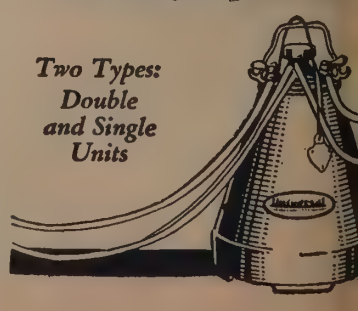
Illinois Jersey Champi

Carnation Pretty Maid, bre owned by B. T. Adkins, is th champion Jersey two-year-old i nois. She produced 544.3 lbs. b fat, 8,721 lbs. milk in 365 day calved in time to qualify for a medal.

Grand Champion Holstein Cow Milke by Universal

THE Grand Champion Hol cow at the National Dairy S last fall was from a herd tha been milked by Universal Mil Machines for the past three y

A milking machine that is goo enough for champion cows is mo certainly good enough for everyda milking of ordinary dairy cow



By reason of its low-vacuum suct the Universal is easier on the cow t any other type of milker—and yet Universal gets all of the milk, as we *cutting milking time and labor in h*

Our catalog has the whole story. Write for your copy.

Two Types: Double and Single Units

Progress in Control of T. B. in Sioux City Territory

HOARD'S DAIRYMAN:—Testing of ttle for tuberculosis and removing actors has greatly improved the arket run of cattle and hogs at oux City, Iowa. There were 40% ss cattle retained for this disease the market during 1926 than there re four years ago. Last year 1.8% all cattle slaughtered (not includg reactors) were retained by the vernment for tuberculosis at Sioux ty, while in 1922 there were 3.0% tained. Almost as large a reducn was found in hogs. During 1926 ere were 13.3% of the hogs reined for tuberculosis and in 1922 ere were 18.03% retained.

During the year just closed a large mber of counties in Iowa were accredited and now receive 10 cents r cwt. premium on their hogs.

The accredited counties have 76% s losses on hogs from carcasses beg condemned and sterilized and % less retentions for tuberculosis Sioux City than are found in the arket run. The removal of the eased cattle has greatly reduced ses in hogs from tuberculosis, but s not removed the entire source of fection of hogs. Hogs also contract berculosis from poultry.

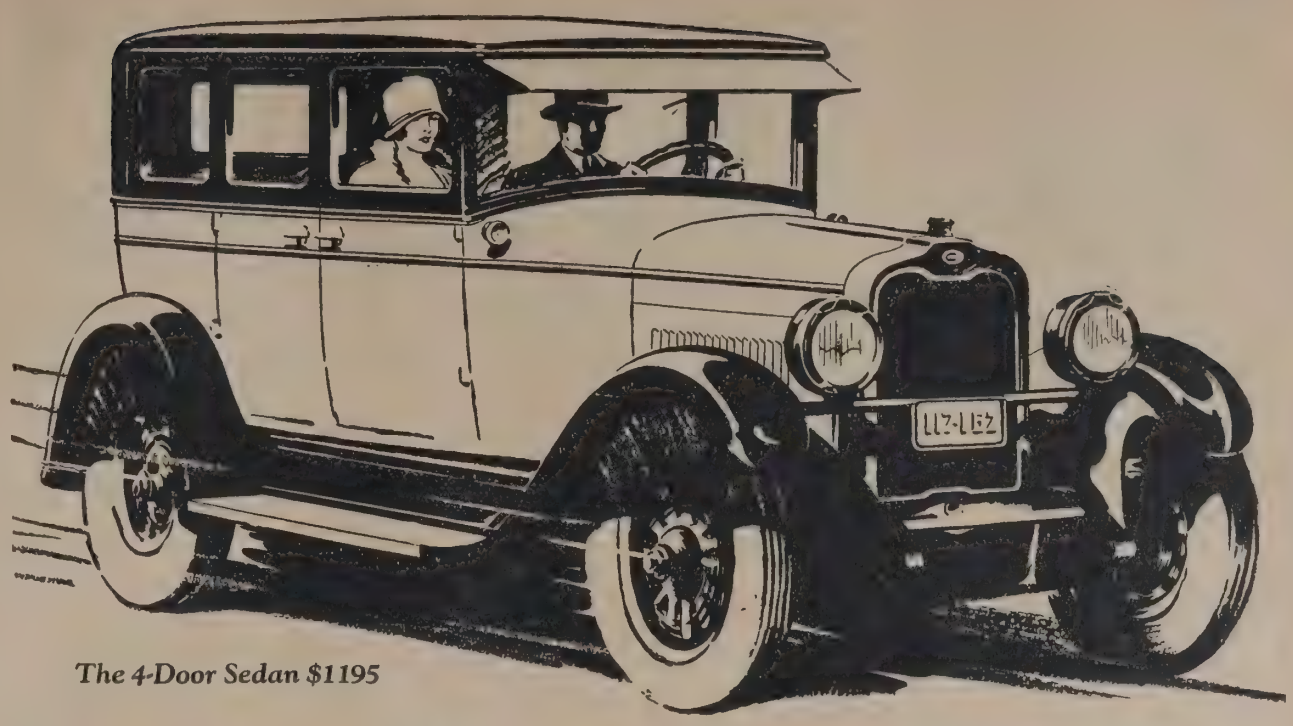
To determine more accurately the nount of tuberculosis in poultry in iner County, South Dakota, an accredited county, the State Department of Agriculture and the United ates Bureau of Animal Industry berculin tested 72 flocks in two wnships in the county. The testing s done last October and out of the farm flocks tested, 67 of them conned birds with tuberculosis. In sting 5,587 mature birds, there re 31.7% tuberculous, while only % out of 9,127 spring birds were nd to have tuberculosis.

If farmers would remove all birds the poultry flocks over two years l, carefully cull out any unhealthy es, and perfectly disinfect poultry ses and clean up yards twice a ar, undoubtedly the large losses m tuberculosis would be greatly duced in poultry and would also re ve the source of infection of hogs. wever, the only sure way to eradie tuberculosis in poultry is to start ew flock with baby chicks or eggs new ground and use perfectly an houses.

Premium Hogs From Accredited Counties

Osceola County, Iowa, during the nth of January received $1,328.28 premiums for hogs at the Sioux y market. This extra price was d by the packers over and above regular market for the hogs beuse Osceola County was recently lared a modified tuberculosis free a by the government. There re 6.1% of these hogs retained for berculosis when slaughtered, while 13% of the regular run of hogs in 26 were retained. Thus the accdited county hogs showed an imovement of 54% over the regular n.

During January this year there re 9,961 accredited hogs slaughted at Sioux City of which 6.1% re retained. This also shows 54% iprovement over the market run of gs at that market.



During the year 1926 several accdited counties in the Sioux City ritory received premiums at the ctral markets sufficient to pay a ge part of the cost of testing cattle f tuberculosis. Murray County, nnesota, farmers received $10,47.37 in premiums on 45,156 hogs t year. Burt County in Northtern Nebraska was paid $10,992.06 premiums on hogs for 1926 and ner County, South Dakota, accredited April 25, 1926, has received $4,288.68 in premiums on hogs.

HARRY J. BOYTS,
Live Stock Commissioner.

A Creamery Report

The Jefferson (Wisconsin) Co-operative Produce Company reports that in 1926 it handled 544,533 pounds of butterfat. It received an average of 42.9 cents a pound for butter and paid its patrons 48 cents a pound for fat after deducting all costs of operation but not including hauling charges for cream.

"I shall pass through this world but once. Any good thing that I can do, or any kindness that I can show to any human being, let me do it now—for I shall not pass this way again."

Detouring the Scrap Heap

"Have you lived a good life?" asked Saint Peter of a trembling female who knocked at his gate.

"I was good at only one thing," answered the woman with a doleful shake of her head. "Cooking."

"Come right in, then," said Saint Peter. "Good cooks have saved more men from perdition than a dozen missionaries. There is nothing around here in the shape of blessedness that you are not entitled to."

This bit of wisdom is at the top of a chapter of one of the most interesting little books I have seen in a long time. As I read it, I thought of one thing and another that I wanted to pass on to you until finally I had so many notes that I gave up because the notes themselves threatened to make another book!

There are, however, so many valuable things in the book that I decided on a sort of review of the various chapters which I thought would interest you most. The book is "Byways to Health" by Thomas D. Wood and Theresa Dansdill (D. Appleton and Company, New York), and I shall just hit the high spots, so to speak, and leave off the quotation marks; you'll know why if you are an amateur typist like I!

Nutrition

Ignoring laws of science and hygiene makes deficient food that repels the appetite and half starves cells and tissues. Shall the potato be a fluffy ball or a gray sodden mass? Shall each vegetable be cooked to conserve its wholesome ingredients or shall they be lost in the cooking? Shall meat retain its nutritive juices or shall it be a tough, imitation food? The answer depends greatly on the cook.

When Frances Willard began studying intemperance among the laboring classes, she said, "They are poor because they drink," but later she said, "They drink because they are poor," and she began teaching the wives how to prepare wholesome food and where they could purchase it reasonably. Poor cooking, unwise buying, and needless waste lessened the efficiency of the small funds which the homekeepers had. The ill-prepared food helped make half starved bodies and to create a craving for stimulants. Sirloin steak costs more than round yet a like portion of round furnishes the body with more protein and fat. Cheese costs less than meat and furnishes at least as much protein. Orange juice is valuable but when the price of oranges soars tomato juice can be used to furnish practically the same value.

Health, energy, and well-being depend very greatly on the quality and quantity of food consumed. Who knows how many nervous breakdowns, how many unhappy homes are the result of poor food which has helped to lower vitality. Who can tell how many illnesses had their beginning in inferior cooking? Blessed is the home where she who presides serves wholesome, attractive, well-balanced food. It may be humble but she who serves it gives something that can help bring sunshine to the heart, laughter to the face, comfort to the body, and peace to the soul.

Dr. Robert McCarrison spent several years working in a remote part of the Himalaya regions where he was impressed with the unusual health of the people living there. He reports that in his nine years' stay he never saw a case of dyspepsia, gastric or duo-denal ulcer, appendicitis, or cancer and he attributes this remarkable state of affairs to the fact that babies are reared on mothers' milk and that the people live upon milk, eggs, grains, fruits, and vegetables, with very little sugar. Their manner of living also requires vigorous outdoor exercise. "I find myself in accord," he wrote, "with the men who affirm that the two chief causes of disease are food and drink!" Intelligent water drinking is an aid to digestion, the amount needed each day depending on the occupation, the season, the daily food, and the individual. Under ordinary conditions the habit of eating too much and too rapidly can be overcome within a short time if we recognize that we would be better for so doing, but we must do this gradually. Do not throw a habit out the window. Lead it out a step at a time.

Occasionally we find a person who cannot eat certain things, but on the whole every person who has not a definite disease can eat beneficially any wholesome food. If everyone who has no organic digestive disturbance would put aside his worries and eat reasonable portions of wholesome food, he would soon find that he was recovering from his imaginary ills. A mother who teaches her child to eat without comment any clean, good food is conferring a benefit on humanity as well as on the child.

Constipation is in most cases a curable disorder. The rules for the average person are few and simple. Upon arising brush the teeth and cleanse the mouth. Drink one or more glasses of water—you may need even three or four. Take the water hot if it seems to act more quickly. Water is an important factor in the elimination of waste from the body and is especially beneficial when taken before breakfast. About fifteen minutes before breakfast try to effect a movement of the bowels but do not strain and if after five minutes the effort is not successful, give it up, and unless a desire comes later do not make any further effort for the day. Repeat next day, being sure to drink plenty of water throughout the day and to eat a good supply of vegetables and fruit. Take sufficient rest, exercise in the open air, cultivate wholesome mental habits, and constipation can be overcome. Keep in mind that you are establishing a habit, that worry, anger, and fear hinder that habit. It takes training and one should not worry if the habit is slow in forming for muscles cannot be trained over night. If there has been no bowel action at the end of the third day, an enema consisting of a quart of water at a time should be taken but the routine of drinking water, making an effort to move the bowels, and so on, should be kept up daily.

The question of fat and thin is another that is bound up with nutrition. The majority of people who are overweight are so because of too much fattening food, too little exercise, and too little expenditure of energy. In the case of underweights the reverse is apt to be true though there are many exceptions to both cases. Records from insurance offices show that when a man or woman is in the best possible physical condition, the weight at that time is the normal weight. If you sleep well, eat adequate food, eliminate properly, do not tire easily, recuperate quickly, and are comparatively free from moods, irritation, and worry, you are healthy. A race horse and a Percheron were never meant to be the same weight and in the human race it is much the same; some persons are meant to be thin while others are born to be fat. Reducing is in many cases necessary to health or even life but sudden reduction of weight is always dangerous and no decided reducing should be undertaken without expert advice. Underweight is due to many other causes than lack of sufficient food, among them being defective teeth, diseased tonsils, infected sinuses, weak abdominal muscles, overexcitement, worry, anger, and severe mental strains. One of the first lessons the majority of underweights needs to learn is relaxation with long hours of sleep in the open air and frequent rest periods. The best gain, the one that is apt to be permanent, is the slow, steady one.

Here I have used up all my space with volumes still to say, so maybe we can continue the discussion another time.

It seems a pity in such a subject as this not to be able to go into detail about cookery, about purchasing, about definite ways to gain or lose flesh, but readers' needs are so varied that it would not be possible. If you are interested in learning more of any phase of this subject write for bulletins to your state department of health at the state capital, or to your state agricultural college, or to the department of health at Washington, D. C. Material that is vitally valuable can be had free from any of these places.—LUCY THOMPSON.

Spoiled Children

It is not uncommon to speak of a grown-up as behaving "like a spoiled child." Wives say it, or think it, of their husbands and husbands return the compliment about their wives. Parents complain of adult children in the same way and some children are forced to describe an unruly parent's conduct in identical language. Always the person referred to has displayed a lack of self-control, selfishness, and has allowed emotions to dominate reason.

Now comes Dr. James J. Walsh and Dr. John A. Foote, in a recently published book, "Safeguarding Children's Nerves" (Lippincott), with the admonition that faulty training in childhood results in the failure of such individuals to grow up to un-

derstanding and unselfishness in their social relations.

"Spoiling," say these author-physicians, "may be commenced extremely early. It is no exaggeration to say that a child may be potentially spoiled before he is even born into the world. Being a 'good baby' is really not so simple and so easy an accomplishment as it might appear. The human family is a complicated co-operative society and we cannot accomplish even the simplest things without some help and assistance from other men and women. And the complicated task of making the intricate biological machine known as a new baby run so smoothly that it is at the same time noiseless and efficient is also an achievement impossible of attainment without intelligent co-operation and help from many sides."

Plenty of rest and quiet is urged for the baby. Jumping him up and down, watching him blink at lights, using him as a toy are practices that may seriously injure the delicate nervous mechanism just beginning to develop. Playing vigorously with him just before bedtime, exciting him, and then banishing him to bed in a storm of crying are practices that should be tabooed.

You must begin early to teach children to consider others if you want to make their way easier for them in later life.

"They should never be allowed to realize that either the justice or tenability of a father's or mother's decision is open to question," advise Drs. Walsh and Foote. "This imposes a high standard of living and thinking and talking on the parents, but that in itself is far from a disadvantage." Herbert Hoover has said wisely, "A great many parents need bringing up." Displays of anger or irritability by a father or mother are the worst possible example for a child of any age. The sense of injustice is acute in the child; he is, of course, prone to self pity.

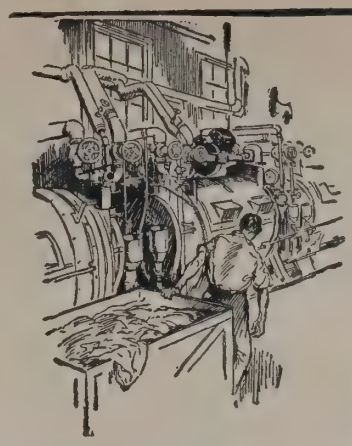
Make the children realize you mean what you say, and that your judgments are wise. It is possible to accomplish this without harshness or lack of tenderness toward them. Usually it imposes a task of self-control on the parent that carries with it its own reward.

Coaxing Isn't Necessary

If a child resists, or is disobedient, as for instance at being undressed for a bath, or when being taken upstairs, do not spend time in coaxing or pleading with him. Tell him quietly, even if

(Continued on next page)

What Size, Madam?



If you are size 46, you will find some styles designed especially for you on Pages 12 and 13 of our Spring and Summer Fashion Magazine.

And then, throughout the book, you'll see styles such as the one illustrated above which is by no means a special for a stout. It is a style equally becoming to the woman who takes a 46 or her slim flapper daughter.

There are many such. You select the one which appeals to you and then order your pattern in the size you need. In the case of the style shown above, you'll find a picture dressmaking lesson showing how it is made.

You need this book. The small cost you will save over and over again on clothes. And you'll look more attractive for the book will lead you to the correct styles. Order your copy now. Send 10 cents to Fashion Dept., Hoard's Dairyman, Ft. Atkinson, Wis.

Many farm women, too, now have electric laundries.

Rural electrification
—a fact on more than 260,000 farms

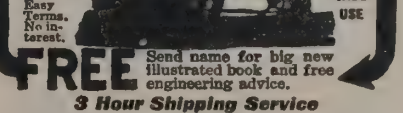
As the result of cooperative investigation carried on in twenty states, electric light and power companies are now building rural lines as fast as circumstances will permit.

On 260,000 farms rural electric service is in successful operation today.

The same force which has done so much for industry will soon be available to an increasing number of farms. The resources and experience of more than forty years of successful city service are back of this movement to bring the farmer the greatest practical help he has ever had.

With the desire to make full use of all the benefits of electric service, and with the development of new equipment, rural electrification will open a new era on the farm.

Rural lines cannot be built everywhere at once, but the light and power companies are ready to extend service to groups of farmers, which together, can use sufficient power to justify the building and maintaining of rural lines.



Rural electrification can come quickly—where farmers and the light and power companies work together for the same good end. Ask your power company for information and cooperation.

The Committee on Relation of Electricity to Agriculture is composed of economists and engineers representing the U. S. Departments of Agriculture, Commerce and the Interior, American Farm Bureau Federation, National Grange, American Society of Agricultural Engineers, Individual Plant Manufacturers, General Federation of Women's Clubs, American Home Economics Association, National Association of Farm Equipment Manufacturers, and the National Electric Light Association.

he is not even a year old, why you wish him to do this certain thing and then firmly but gently proceed to do it and get it over with as soon as possible. This will avoid long, drawn-out emotional ordeals for both the child and mother. After a while the child will realize that obedience is the easier way. Children are the most impressionable beings in existence. They are also the most imitative.

To teach the child how to realize and how to observe the personal limitations which are necessary under even ordinary conditions of social life, without at the same time forcing him into a rigid pedagogical groove, is the problem which confronts every parent.

If an infant has been spoiled it is probable some one has devoted ti and attention to the work of spoili him. The same measures that p vent spoiling children, assert c authorities, will also serve to unspl them, though the work is not an ea one. Many a violent outburst a emotional crisis will probably have 'be undergone before the child lear self-discipline. And this is an acco plishment, we are told, that is best f all taught by personal example of t teacher.—Certified Milk.

A New Freedom

I should like to see women fre from clutter, from the care of u less bric-a-brac, from the care of t many kitchen utensils, from the c standard of housekeeping whi made one woman afraid to have a other woman discover a speck of du or a cobweb in her house.

I should like to see such simplici in furnishings as is in keeping wi the income so that we might get r of that awful bogy of "keeping w with the Joneses" and being forev behind on paying our bills. I shou like to see self-expression and co fort in the household furnishin rather than slavish following of pr vailing styles. More independence choosing what life offers of value us and seeking it out, letting t Joneses do what they will.

I should like to see more sincerit more genuine friendliness, and le pretentious display in our homes.

The ideal home life of today tak into account the furnishings of t house for comfort, convenience, ea of being cared for, beauty, and ass ciation. We like to have in o homes those things which remind of pleasant experiences and peop who have a place in our affection This idea is expressed effectively in little poem entitled, "Earth-born. The first verse is a follows:

"Do you think God will make us forget—
When we wake up in Heaven—
All the queer, little earth-fashioned things
That are sacred as archangels' wings
Or the stars that are seven?
Our books, our green china with posies,
My white wedding gown with its roses,
The candles we light
In our wee house at night,
Your father's old clock with its wise friend face,
Any of my mother's old lace—
Do you think Love can ever forget?"

I believe we can find enjoyme in cultivating an appreciation f these things which mean so muc more than appears on the surface.— LITA BANE, University of Wisconsi

Cook Pork Well

We used to visit in a home whe one of the girls had a habit of eatin raw salted pork whenever she coul sneak away and get it. Her mothe was always warning her that sh might get some bad disease by doin this but the girl concluded that s she never had, she never would. never heard whether she did but have learned something about th disease her mother meant. It is calle trichinosis and is caused by a tin parasite that lives, even in health hogs, in the muscular tissues.

The disease, say experts from th U. S. Bureau of Animal Husbandry is similar in symptoms to typhoid fe ver and often goes through a whol family. To avoid having it is simpl and involves only that all pork eate should be well cooked. A practica rule is to cook it until the pork ha lost all red color throughout or unt the fluids of the meat have becom well jellied.—LUCY THOMPSON.

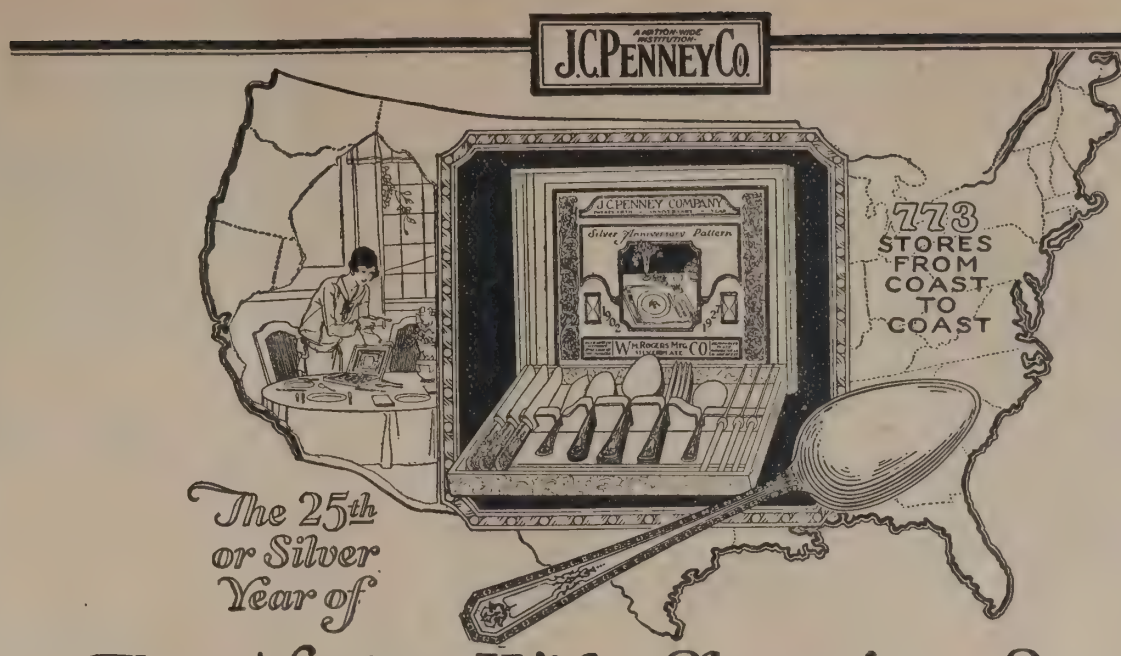
Farmers Should Work Together Like Business Men

HOARD'S DAIRYMAN:—Now that the McNary—Haugen Bill has been vetoed, what are farmers going to do about it? Whether or not you and I think this bill would have helped the farmer, we never will know. Whether or not any proposed farm legislation is ever again brought up in our national congress, we may now feel fairly certain that nothing will ever be done. What are we going to do about it?

We know that the price of a suit of cotton clothes is high enough so that the manufacturer makes a profit in spite of the fact that there are quite a number of competing manufacturers. The same is true of plows, binders, steel, furniture, manufactured food products, silos, corn, oil, wheat, flour, and cigars. There are two or three reasons for this in addition to any advantages that manufactured articles may have over raw products, as to tariff. First, there are fewer manufacturers, jobbers, wholesalers, and retailers than there are producers of raw products. Second, they either get together and agree (or are independently wise enough) not to overload the market or cut prices below a margin of profit. They make the tariff and business conditions operate to their benefit.

Farmers can do the same and it is about the only recourse farmers have. They might just as well make up their minds to follow illustrious examples and well proven methods of big business, or go off their farms.

Some people think there are too many farmers to co-operate, but don't forget that there are hundreds of thousands of stockholders of the United States steel corporation and the railroads and the American Telephone and Telegraph Company and the other companies whose stocks are listed on the New York Stock Exchange. These concerns all have stockholders scattered over the entire United States and business establishments all over the United States, and have centralized control. As a general rule, when undisturbed by war or similar conditions, they return pretty fair profits to the stockholders and certainly serve the public well. It has taken years to build them up and it would take years to build up the marketing of farm products on the same scale, but a big thing is just a little thing multiplied and there is nothing impossible about co-operative handling of all farm products.



They say farmers haven't the ability and can't co-operate. George Washington, Abraham Lincoln, President Coolidge, and some others I have heard about all come from the farm and have shown pretty fair degrees of ability. I believe the farm has furnished more successful city business men than any other one American institution, or, if you prefer, place of birth. Farmers are no more individualistic than other people. Their wide separation does make their problem a little harder of consummation, but all American business has had to go through the same path of development that is now open before the farmer.

If you will look through the reports of co-operatives, printed by the Bureau of Agricultural Economics at Washington, D. C., you will see that a wonderful growth, both as to number of co-operatives, membership, and volume of business, has taken place in the last fifteen years. Co-operation is on the way. You can't stop it and farmers might just as well begin now to plan to dig down into their flat pocketbooks and furnish the necessary money for handling their own business or plan on turning their farms over for the mortgage.

It is surprising what a few cents on a hundred pounds milk, or a few cents a bushel on grain will do toward buying a creamery or an elevator. Farmers should run their co-operatives like regular businesses in town, which have to be built up from small beginnings. A farmers' co-operative isn't something to be bled to the bone at every opportunity. It is an agency of the farmer in producing funds for the farmers' benefits, and should be nursed along and cared for and helped in its growth as much as the fertility of the soil or the development of a high grade herd. Farmers' co-operatives should unite with the central selling agency or if there is no such, then they should organize with other co-operatives for forming such a central agency. When enough money has been saved to pay for the receiving station or the elevator or the creamery, a little surplus should be put away and then a little more should be saved to invest in the milling business or the feed business or milk distribution and ice cream manufacturing. It will take years but farmers couldn't be much worse off than now.

The First National Bank in our town is seventy years old and has been growing every one of those seventy years. If farmers would start to co-operate to handle all of their products at the present time, it wouldn't take them nearly as long to own the whole business from their farms to the consumers' back doors as it has taken the banks to attain their present size. Farmers also would find that the years and the money invested in co-operative development have not been wasted but have returned a steady profit over the old way all the time that they were growing.

The 25th or Silver Year of

This Nation-Wide Shopping Service

To Be Signalized — Starting April 1st — by

Extraordinary Memento Offerings

FOR a quarter of a century the J. C. Penney Company Department Stores have been solving the shopping problems of American families through utilizing their tremendous cooperative buying and selective power.

Our great buying advantages and cash purchases save millions of dollars every year. These important savings are passed on to our customers in better quality at lower prices.

The J. C. Penney Company has become a household word thruout the United States for *quality* in General Dry Goods, Outer Apparel, Millinery, Corsets, Dress Accessories, Clothing, Hats, Furnishings, Footwear for the entire family, also well-known Notions at 4c. and 8c.

Some of our own Nationally-known brands and values: Lady-Lyke Corsets, 445 and 449 Full-Fashioned Silk Hosiery, Honor Muslin, Penco Sheets and Sheetings, Ramona Cloth, Pay-Day Overalls and Work Shirts, Nation-Wide Work Suits, Big Mac Work Shirts, Marathon Hats, the famous J. C. Penney Company Shoes and other brands.

The convenient location of our 773 Stores, distributed over 46 States, gives everyone the advantage and pleasure to be had from personal selection. If there is not a J. C. Penney Company Store near you we would like you to write to us.

26-PIECE SET

Original and Genuine Rogers' Guaranteed Electro Table Silverware

6 Forks — 6 Tablespoons
6 Knives — 1 Sugar Shell
6 Teaspoons — 1 Butter Knife

$5.90

Per Set, In Artistic Box
25c. Extra If Ordered by Mail

PROMINENT among our Silver Anniversary offerings is an extraordinary saving in 26-piece sets of original and genuine Rogers' guaranteed electro Silverplate Tableware.

One of the largest makers of quality silverplate has liberally collaborated with us in providing this Silverware in a new original "Silver Anniversary Pattern," as illustrated above. Its chaste lines and beautiful design will always be in good taste in every home and for every occasion. It is made of the highest quality nickel silver metal with a heavy deposit of pure silver. Knives have quadruple silverplated handles with steel blades that will not corrode or stain. Forks and spoons have reinforced plate where wear is greatest.

The manufacturer's certificate of guarantee accompanies every set. The price—$5.90—is so low as to bring this Silverware within reach of all for everyday use.

This remarkable Silver Anniversary offering is a high spot in our long, enviable history of Value Giving. Whether you buy one of these beautiful sets for yourself or for a gift, it represents one of the most extraordinary savings ever offered.

It is a Great Memento Silver Offering for a Great Silver Anniversary.

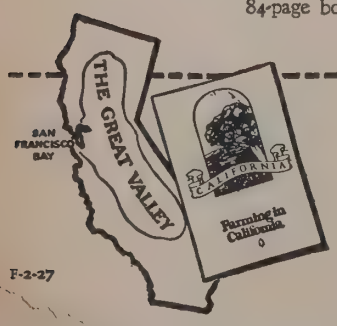
Rich green pasturage—mild Decembers—*that's California!*

When you travel between the laden orchards and rich fields of California's Great Valley, on your trip this summer, try to picture what it will be like next winter!

Summer is the *easy* time to come. The Lincoln and Victory Highways carry you at easy road-speeds over the crest of the Sierras, past Lake Tahoe, 6,300 feet high, through the historic old mining towns of '49. The railroads offer you a quicker trip, and low summer fares are in effect from May 15 to September 15, taking you out one way and back another for as little as $90.30 round trip from Chicago and even less from points west.

Whichever way you come, take time to see how Californians farm in the Great Valley and neighboring valleys, and ask them how they like it. Go up into the cool mountains, two hours' drive from almost any valley farm, and see the peaks and meadows, the lakes and streams, that we who live here own as a part of our vast National Forests. See how California farm families lighten their farm labor and housework with cheap and plentiful electricity. Notice the rural schools that you pass—there are none finer in America. Stop a while in some of the towns, and run down to San Francisco Bay where a million people live.



Then, when you have seen the richness of California in summer, imagine the always-sunny days turning to warm, gentle, rainy days, the temperature still far above freezing, the fields green and snowless, the roses in bloom and the oranges ripening—and you can picture a California winter!

How would you like to live here all the year? You can. California needs more good farmers, with enough capital for a fair start. We cannot raise enough of many things for our own needs because our cities are always growing faster than our farms. Yet we can offer the farmer year 'round pasturage for his dairy herd, his poultry and his hogs, the highest average production of butter per cow in the United States, and 20% *higher butterfat* prices than the national average. California, which feeds the world with fruits and vegetables, imports 25% of its butter and 75% of its pork, and pays higher prices for them than you get at home. And you can quickly find out how much easier and more profitable it is to raise them here.

Your family will like California. Life is better here in every way for each of them. And for the average man, all statistics show that Californians are about twice as prosperous as the average American elsewhere.

Low summer round-trip fares to California beginning May 15

Californians, Inc., will help you with all the information you need about farming in California. This is an organization formed in San Francisco by leading citizens and business institutions who are interested in developing the state. It has nothing to sell, but much to give. Its service means a saving of time and money as you will see when you read the 84-page booklet, "Farming in California." Ask for your copy today!

Wide Range Shown in Cost of Producing Pork

Wide variations in the cost of producing pork are shown in a survey made by the Department of Agriculture of farms in Henry County, Iowa, and Warren County, Illinois, said to be typical of corn-hog farms throughout the corn belt.

The gross cost of producing 100 pounds of marketable pork on 44 farms in one year ranged from $3.07 to $13.55, with an average of $5.49. Production costs on 39 farms in another year ranged from $4.86 to $10.02, with an average of $6.32. The figures are for the years 1921 and 1922 and are presented merely as showing the variation in costs.

The variation, the department says, indicates the influences of care and management in the hog lot. The farms were within a short distance of each other; it was possible to follow very similar methods within the region, and yet some farms shipped hogs to market costing more than twice what they cost other farms.

Detailed results of the survey have been published in Department Bulletin No. 1381, "Cost of Producing Hogs in Iowa and Illinois," copies of which may be had free, as long as the supply lasts, upon request to the Department of Agriculture, Washington, D. C.

To Settle a Dispute

A Wisconsin reader has had an argument with a neighbor over the feeding value of corn for pigs after it has passed through the digestive tract of a cow. It raises an interesting subject for discussion.

If the question raised is as to whether there is or is not any nourishment in the corn contained in the dung of cows, the dispute is easily settled. There is some nourishment in such corn. If the dispute is over the amount of nourishment, it is not so easily settled.

The feeding value of corn in the dung from dairy cows is ordinarily less than is true with beef cattle because of the more common practice of grinding the grains for dairy cows. Because of this, less effort is made by dairymen to salvage the nourishment with pigs.

It is a common practice with steer feeders to run pigs after steers being full fed on corn, roughage, and other supplements. The gain on the pigs is frequently the deciding factor between profit or loss on the steers.

The number of pigs that may be run after a given number of steers depends on several factors, the most important of which are: (1) the age of the steers fed; (2) the proportion of corn making up the ration; (3) whether the corn is fed snapped and whole, husked and whole, or ground; (4) whether silage with considerable grain in it is fed; (5) and somewhat on the quality of the corn fed.

The range is from 1 to 3 pigs per steer on snapped corn, 1 to 2 per steer on husked ear corn, about 1 per steer on shelled corn, and 1 pig to 2 or 3 steers on crushed or ground corn. The younger the steers, the better they chew and utilize their feed and the smaller are the gains made by pigs following. In addition to the feed gotten in this way, it is advisable to feed pigs from one-fifth to one-third of a pound of tankage per head daily.

With dairy cows fed on ground grains and with the roughage frequently composed entirely of hay or of hay and silage made from immature corn, it would not pay to run pigs after them for what they would get from the dung, though one can not say there is no feeding value there.

Another factor must be considered in running pigs after dairy cows and that is one of tuberculosis. Pigs should not be allowed to follow a herd of cows that has not been tested and freed from tuberculosis. To do so invites the probability of infecting the pigs.

Value of Weanling Pigs

In dairy sections the exchange of weanling pigs is a business of no small importance. Estimating the value of weanling pigs has been more or less of a speculative nature. Competition in communities or at public auctions is the yardstick by which the value of weanling pigs is most frequently measured. Sometimes the yardstick is too long and the buyer comes out on the small end of the deal. Sometimes, too, the producer of pigs thinks the yardstick is too short.

The Oregon Experiment Station throws some light on the value of a weanling pig in proportion to the finished hog by calculating the total cost of producing a hundred pounds of market pork in terms of grain.

According to this data it takes the value of 618 pounds of grain to cover all the costs of producing 100 pounds of pork. Of this value it is estimated that 30 per cent is required to cover all the costs of bringing a pig up to weanling age. For example, the value of 1,236 pounds of grain would cover the total cost of producing a 200-pound market hog. If grain is worth one and one-half cents a pound the cost of the 200-pound pig is $18.54. Of this amount 30 per cent or $5.56 is represented in the cost of producing the pig to weanling age. One year with another, this represents a fair basis for estimating the value of weanling pigs. There are some, however, who will always want to gamble that the price of market hogs will go up.

"Why is it that a red-headed woman always marries a very meek man?"

"She doesn't. He just gets that way."—Dry Goods Economist.

A man's disposition is never well known until he is crossed.—LORD BACON.

A Dairy Farm Statement

HOARD'S DAIRYMAN:—Since reading your review of dairy markets in 1926 I thought you might be interested in my farm report for that year as it seems to prove your statement that it was a good dairy year. I found 1926 the most profitable year I have ever had since starting for myself in 1917. After paying all expense of operation, including wages for myself at $100 a month, the farm returned 11.2% on its total inventory value.

My farm consists of 120 acres in Southern Wisconsin, with 40 acres in pasture. On the average I raise about 35 acres of corn, 25 acres of alfalfa and clover, and 20 acres of grain and sundry crops. I keep something over 40 head of grade and pure-bred dairy cattle, about half of which are milk cows. I sell cream to the local co-operative creamery, feeding the skimmilk to calves and hogs. During the cow testing year completed in 1926 (present year nearly up) my herd of 19 cows and heifers averaged 305 lbs. fat at a feed cost of $64. At the prices then prevailing this gave me a profit over feed of $82 per cow, not counting the value of skimmilk. With this explanation I first give my inventory for the past two years, as follows:

	Jan. 1 1926	Jan. 1 1927
Land (120 acres)	$12,500	$12,500
Buildings	5,821	5,796
Live stock	4,685	5,634
Feeds	1,756	1,500
Equipment	709	845
Total	$25,471	$26,275

I inventory the land and buildings at their cost in 1917, plus the cost of improvements and repairs and less the usual depreciation charges. Equipment is inventoried at cost less depreciation, and feeds at the prevailing farm price on January 1. Grade cows are inventoried at $100 each and pure-bred cows at $250, with younger animals in proportion. I have carried the same figures for grades since I purchased the farm so as not to show an inventory profit that may not be realized, although my selling prices are 50 to 100 per cent above this. Pure-breds are valued at 50% of the cost of the original cows and comprise less than half the herd.

My account for 1926 is as follows:

Received	
5,428 lbs. fat at 47.3c	$2,566
Dairy cattle sold*	1,778
Beef and veal	52
Hogs	1,214
Crops sold	108
Total cash	$5,718
Inventory gain	804
Farm credits†	332
Total receipts	$6,854

*2 bulls, 7 cows, and 6 heifers and calves.
†House rent, garden, milk, etc.

Paid Out	
Feed	$710
Live stock bought	260
Veterinary	64
Fees, commissions, advertising	150
Seed	88
Harvest expense	134
Hired help and board	516
Taxes	230
Insurance	20
Repairs and supplies	344
Equipment	221
Sundry	54
Total cash	$2,791
Salary credit	1,200
Total paid	$3,991
Net profit	2,863
	$6,854

In the above statement I have assumed that the combined work of my wife and I was worth $100 a month, and after charging this in I had a net profit of $2,863, or 11.2 per cent on my 1926 inventory of $25,471. Another way to figure would be to charge the farm with 5 per cent interest on investment ($1,274), making total expenditures of $4,065. This would leave my labor income as $2,789.

I would appreciate figures from other dairymen who have kept books, as also criticism of my bookkeeping. I feel as though I was particularly fortunate this past year both in good markets and relatively low cost. I have also been fortunate in the past two years in having more than half my calves heifers, which means a good deal when one good item is the sale of surplus cattle.

Wisconsin. JOHN S. CHARLES.

Tramping Silage—Rusty Pipe Partitions

HOARD'S DAIRYMAN:—When I saw E. H. Hobson's method of tramping silage with goats I fully intended writing what I thought of his method. I have been filling from one to three silos for the past fifteen years. Henry A. Ochnser has given my opinion, with the exception of not wanting one man in silo just to carry the distributor so the grain and fodder will be mixed uniform. The last two years I have not used distributor or had a man in silo. Once each day for the first week after filling I go over it and do not think it dries out as deep as when not gone over.

When the partition pipes between cows rust off at the concrete, instead of throwing them out I cut a smaller pipe eighteen inches long and put it inside of the broken pipe. Any one would not know they had rusted off. When I built my barn I believed the partition was worth putting in, and still believe it worth keeping in.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

A Farm Boy Follows Through

Part 2

HERBERT Wisch lives on a 43-acre Wisconsin farm. There are something over a dozen head of good Guernseys, pure-breds and grades, in his father's herd. One of Mr. Wisch's cows was included in a shipment to the Hawaiian Islands two years ago. The cream is marketed at the creamery.

Mr. Wisch usually raises enough roughage, alfalfa hay, and corn for silage, to take care of the needs of his cattle. But when it comes to raising enough concentrates on 43 acres—that's different.

During his senior year in high school, Herbert studied dairy rations in his agricultural class. Naturally he wanted to see just what kind of a ration his father was feeding and if there might not be a chance to improve it. With the aid of a table showing the analysis of feeds, such as was published on page 6 in the January 10th issue of Hoard's Dairyman, he figured it up and found that his dad's ration contained nearly enough protein but the total digestible nutrients were "lamentably weak," to use Herbert's own language.

Right then Herbert decided upon his project. He would weigh, test, and keep records on the herd. From these records he would figure up balanced rations. He would see if he couldn't cut down the cost of feeding without lowering the production. So Herbert secured a milk scales, a record book such as cow testing association members use, and ruled off a sheet of paper for a barn record.

He took a sampler and several sample bottles home from school one day in March and collected a sample of each cow's milk, taking some from the evening's milking and some from the morning's milking. He labeled the bottles, took them back to school, and tested each by the Babcock test, recording the percentage.

This was something new on the Wisch farm. His father had never kept records. As long as he got a "good mess of milk" from his cows, he was content. Mr. Wisch was interested in the project, however, and co-operated eagerly.

2—Herbert secured milk scales, a record book, and barn sheets. He then weighed the milk from each cow in the herd.

Six cows completed full time records. One cow went dry six weeks after the records were started and two heifers freshened in June. The total production of butterfat from April 15 to August 1 was 868.1 lbs. The income over feed cost for the herd in this period was $214.-29. While Herbert discontinued testing soon after this to get ready for college, his father has been recording the weights of every milking. It is significant that the largest milk check ever received by Mr. Wisch came in October, a direct result of the better feeding practices introduced by his son, Herbert.

1—With the aid of a table showing the analysis of feeds, Herbert figured up his father's ration and discovered a chance for improvement. He decided at once to make the feeding and management of the herd a school project. After that he spent considerable time balancing rations, always striving to keep up production and cut down feed costs. He has a copy of Hoard's Dairyman close at hand.

Herbert says, "When I took over the feeding and management of the cows they were somewhat thin. This meant that they had to divide their feed and energy between the milk pail and regaining their condition. Then, too, most of the cows were due to freshen in the fall which meant that their lactation period was well along and the peak of their production period had already been passed."

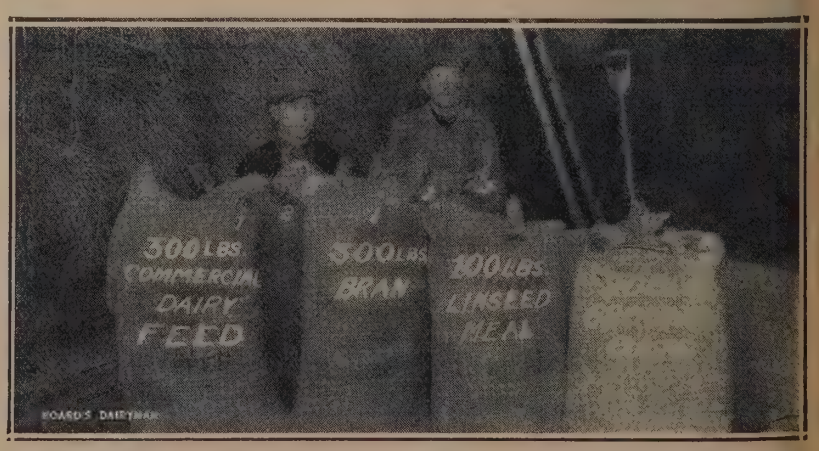
Being of an inquiring mind and a boy who follows through, Herbert found out several important facts from his herd management project. 1. That feeding grain to cows on pasture pays not only in better returns during that period, but in keeping the cows in better condition for their next lactation, building a body reserve so that the demands of calving and motherhood upon the cow will not "run her down." 2. That profits in dairying depend on obtaining a maximum production at a minimum feed cost. 3. That changing to a balanced ration late in a cow's lactation period will not necessarily bring immediate increase in production. The only fa comparison for improved feedin practices is to compare with the san period in the following lactatio 4. That the amount of fertility whic is returned to the soil depends c what and how you feed.

3—He took a sampling outfit home from school and collected samples from the morning and evening milking of every cow in the herd.

"I found out that variety is impo tant in the ration," says Herber "The cows like a change occasional and if it is one that suits them the will respond at the milk pail. Anoth thing, you have to be careful not feed your cows too much. You ha to watch them and see that they clea up what you give them. I discovere that it pays to feed all the goo roughage the cows will eat."

How did Herbert tackle this fee ing proposition? How did he figu out the rations and get them to ba ance? How did he cut down on th feed cost and still keep up the pr duction? That last question is mighty important one and mea added profits. With the answers these questions, you boys who are i terested can proceed to apply them c your herd at home.

We might say that "The Feedin of Dairy Cows" has been complete discussed in a series of articles pu lished recently in Hoard's Dairyma under that title, commencing in th October 25th issu last fall. Herbe says that anybo can figure ratio after readin these articles.



Herbert use Henry and Mor son's feedin standards whic give a range f both digestib protein and tot digestible nutr ents. For instanc there was Sta His figures show her requiremen for maintenan and production b tween 2.112 an 2.424 lbs. of pr tein and betwe 15.9205 and 17.00 lbs. of total d gestible nutrient In like manner determined the r quirements for every cow in the her

But what was Star getting in th way of protein and total digestib nutrients before? Remember, He

(Continued on page 405)

4—Mixing new concentrate combinations on the barn floor, Herbert put his figures to work. "I found out that variety is important," says Herbert. "The cows like a change occasionally and will respond at the milk pail. It pays to feed all the good roughage they will eat."

5—Herbert started his father keeping records and feeding better rations. Mr. Wisch "got the idea" for this mixture from his son's work. While home from college at vacation time Herbert balanced several rations for his dad. Father and son are kneeling behind the feed.

With the Birds at Lake Ripley

ANGIE KUMLIEN MAIN, WISCONSIN

T was with great anticipation that the children and I left the farm to spend the week-end at Lake Rip- in early May, 1926. The children nt out to play in and around the ater of one of the prettiest and fest little lakes in Southern Wisconsin, while I went out to study and enjoy the birds.

ngie Kumlien Main rs. Herbert A.) is wife of a Wisin dairy farmer. uncle and grandher, Kumliens, e well known natlists. Mrs. Main the author of rd Companions."

At dusk a screech owl began his day's work of food hunting, accompanied by weird and wailing cries to his mate and family of owlets in a hollow burr oak tree near the cottage.

At daybreak the next morning I was awakened by the sad wolfish call of a loon from the lake. Hurrying to the window I scanned the surce of the lake for the owner of this imitive cry and with the aid of the ass saw a loon or a great American er riding on the water. Some call s lone cry of the loon a storm sig- but this day was calm and glori- s with sunshine.

I noticed several flickers on the ound in front of the cottage; they med to be very busy at something. closer observation they were seen run their long bills into small ant ls and when the ants rushed out e flickers caught them with their g, sticky tongues. This was quite easy way to get their breakfast.

I never saw so many kinds nor so ny woodpeckers in one small place I saw this morning. Several redded woodpeckers played about the d; the downies and hairies seemed re serious as they hunted their d from the tree trunks. Here were four members of our drum corps one lawn.

These trees being very old and newhat decayed furnished insect d in plenty and many choice nest- sites had been chiseled out from r to year.

Bluejays flew about the place and r into the swamp and back where y were bent on some mischief. eir cries of "Thief, thief" warned smaller birds to be on their guard.

While we sat eating our breakfast the back porch, a beautiful Baltire oriole put in his appearance. gay plumage of flaming orange l black lit up the oak like a bright er. He gave us a sample of his h full voice.

Killdeers flew from the lake shore the field over the way, the while ing their "Killdee, killdee." Here y gracefully ran about picking up ir breakfast on the newly sown field.

Cowbirds stalked about keeping an out for other birds' nests where y might lay their unwelcome eggs. nze grackles walked about, their ow eyes ever on the watch for d. Chippie sparrows were as tame e as they are in my own door d.

ong sparrows, known as the flowof their family, sang their sweet ody. These versatile musicians g in all kinds of weather and are ed for their cheerful dispositions. oing over into the field back of the age I found vesper sparrows who and flew before me, keeping just about so far ahead, their outer white tail feathers identifying them.

In a tall black oak tree, a brown thrasher, from the top most branch, repeated twice over each phrase that he sang. When I said to him, "Who are you?" He sang, "Pretty good fellow, pretty good fellow."

White-throated sparrows or peabody-birds, as they are known in some parts of the country, were on every hand. They sang their famous clear whistled song, the charm of which lies in its rythm. I could easily fit to the song the old time words of, "Old Tom Peabody, Peabody, Peabody."

High overhead a kingbird made known his standing in the bird world as he chased a crow, who was more than twice his size, over the trees in the swamp.

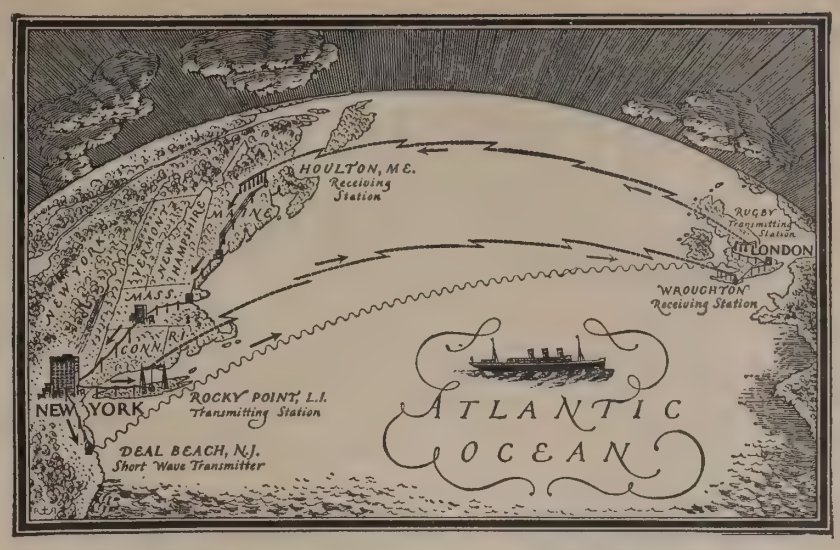
A meadowlark walked around showing his buff, black, and yellow to good advantage. From one of the bogs he lifted his flat head and sang his plaintive song which sounds like, "Spring o' the year."

As we had driven away from home the afternoon before, a western meadowlark had sung for us from near the barn yard his wild, sweet song which is far richer and more musical than our own meadowlark's.

A bobolink, close nesting neighbor of the meadowlark in the meadow, gave me samples of his tinkling music. This great singer is at his best while with us. Here he wears his gay nuptial suit and sings his lively music, while in the South he wears his dull colored coat and does not sing a note.

Barn swallows, tree swallows, bank swallows, and purple martins flew over the meadow with their mouths open for insects.

Several mourning doves flew around the cottage lawn and back and forth to the woods. Their flight was rapid and accompanied by an audible whistling noise.



As I neared the swamp I noticed three or four large dark birds flying overhead which at first sight I took to be crows, yet these birds did not fly like crows for they held their wing tips straight down. As they came nearer I noticed that they made curious sounds like "skeow" and a whispered "wowoogt" and a "k'w," which told me that they were not crows. Before I reached the small tamarack swamp, I could see several nests made of twigs that were placed high in the tamaracks.

After a struggle over the bogs, I reached the swamp but the birds became more wary and flew to the tops of the trees where it was hard to see their markings. I experienced a joyous thrill when, with the aid of the glass, I discovered these birds to be green herons. Several of the nests were old and unoccupied. Only three or four pairs of herons were found to be nesting.

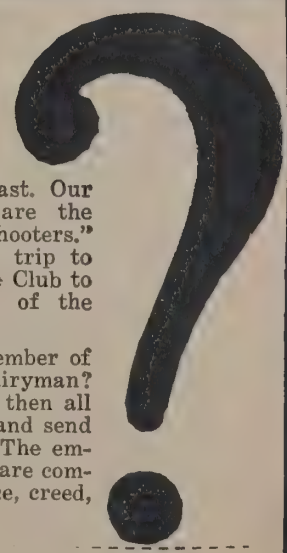
I will never forget the picture they made with their glossy, dark green crested heads, the crest feathers falling over their bare necks in the back, their green backs, wings, and tails, rich chestnut on sides of heads and necks, with lower surface of bodies ashy brown, and narrow streak of yellowish white on throats.

Fragrant white violets were growing abundantly in the swamp, although in some places they came up through a carpet of dried tamarack needles.

A kingfisher flew from the lake to his hole in a bank back of the swamp.

The Radiophone's Meaning

An Advertisement of
the American Telephone and Telegraph Company



AN ADVENTURE in communication was made last January when transatlantic radio telephone service was established between New York and London. There had been previous tests and demonstrations. Nevertheless, the fact that at certain hours daily this service was made available to anyone in these cities from his own telephone, created such public interest that for several days the demands for overseas connections exceeded the capacity of the service.

It was then demonstrated that there was a real use for telephone communication between the world's two greatest cities. It was further demonstrated that the American Telephone and Telegraph Company, with the co-operation of the British Post Office, was able to give excellent transmission of speech under ordinary atmospheric conditions.

In accord with announcements made at that time, there will be a continued effort to improve the service, extend it to greater areas and insure a greater degree of privacy.

It is true that static will at times cause breaks in the ether circuit, but a long step forward has been made towards international telephone communication and more intimate relationship between the United States and Great Britain.

Have You Joined the Hoard's Dairyman Juniors

We want you with us. Our club is growing fast. Our membership is world wide. Our members are the "doing kind," the "live wires," the "square shooters." A Hoard's Dairyman Junior recently won a trip to Europe given by the American Guernsey Cattle Club to the outstanding Guernsey calf club member of the United States.

Are you under 20 years of age? Is some member of your family a regular subscriber to Hoard's Dairyman? If you can answer these two questions, "Yes," then all you have to do to join is sign the application and send it in. No membership dues, no costs to you. The emblems of our club will be sent to you when you are completely enrolled. Get your watch fob or necklace, creed, and pin right away!

HOARD'S DAIRYMAN
JUNIOR EDITOR
FORT ATKINSON, WIS., U. S. A.
Dear Sir:—

I hereby apply for membership in the HOARD'S DAIRYMAN JUNIORS' CLUB. I agree to read the Junior Department of Hoard's Dairyman regularly and do all I can to make the Juniors' Club a success. Please send me the Watch Fob [ ] Necklace [ ] mark (x) after your choice, the Pin, and the Creed.

Good Fencing Makes Intensive Farming Pay

HAVE you revamped your fences to correspond with the new program of diversification of crops?

If not it's time to do it now.

The man who uses the same ideas and tools of 20 years ago is on the sure road to no profits.

Profits leak through run down fences. Valuable cattle break into growing crops and you lose part of your crops and often valuable animals as well.

Animal losses of this kind would buy a lot of fence. These are losses the farmer cannot recover but he can prevent them.

With the RED TOP Post Driver one man can drive 200 to 300 posts in a day

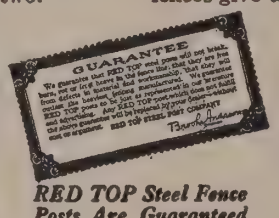
Red Top
GUARANTEED
Steel Fence Posts

Good fences are not an expense but an investment.

The new method of farming depends on good fences.

With good fences you have "control" of your farming operations. You can rotate, not only your crops but your stock also—giving back to the land much of the fertility taken from it by the crops.

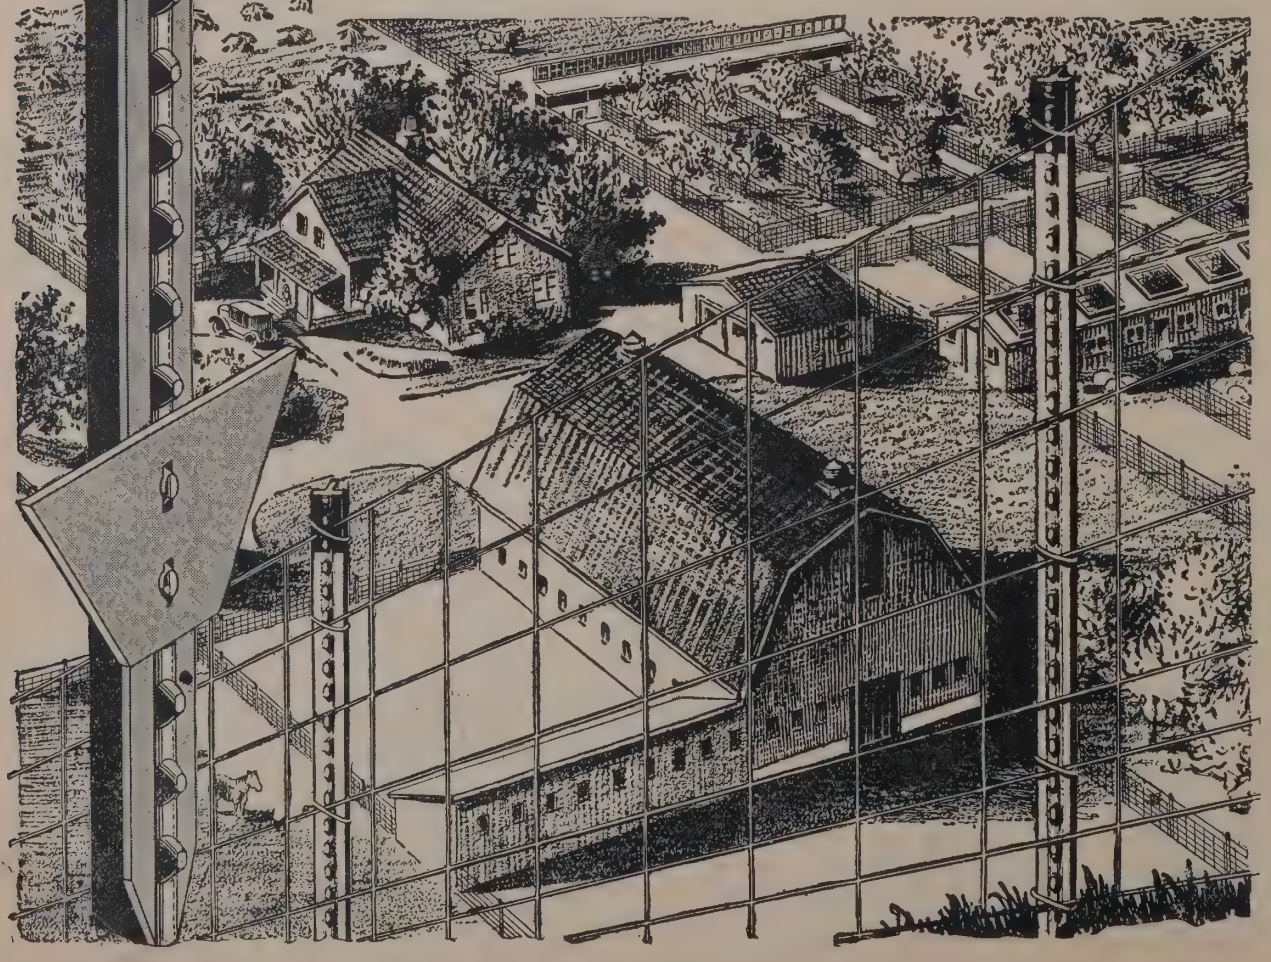
Your stock benefits by frequent change of pasture and disease has less opportunity to get a foothold.



Good fences, too, promote the salvage of grain by turning in stock after harvest—a practice that will almost pay for that fencing the first season or two.

And good fences depend on good posts. Be sure you get RED TOPS—because RED TOPS are made of tough, springy, long-lived railroad steel—a quality that makes it so easy for you to drive RED TOPS through any condition of soil—a quality that makes RED TOPS hold the fence with the same steady security year after year for many years.

RED TOPS outlast 4 or 5 ordinary wood posts. No repairing, restapling nor replacing each year—time and expense saved. And RED TOPS are so easy to drive that one man with a RED TOP Driver, can drive more posts in one day than two men can set ordinary wood posts in a week. RED TOP posts are easily drawn and redriven in new locations—making easy the changing of a fence line or erecting temporary fencing for "hogging off" corn.



RED TOP posts in boundary, and cross fences give that "well kept" appearance to the farm that substantiates the idea that the farm owner is progressive and successful.

Go to your RED TOP dealer. He *knows* all about fence posts. Ask him to show and tell you why RED TOPS, in the long run, are the cheapest post you can buy.

RED TOP Steel Fence Posts Are Guaranteed

A Farm Boy Follows Through

(Continued from page 402)

said she was getting about gh protein but the total digesti- nutrients were "lamentably ." This is Star's old ration:

	Lbs. Fed	Lbs. Protein	Lbs. T. D. N.	Cost
a	6	.636	3.034	$0.048
ilage	30	.33	5.04	.105
	3	.375	1.713	.0465
d meal	2	.604	1.39	.05
		1.945	11.173	.2495*

25 cents.

is ration is light in amount, lacks riety of concentrates, and while produced 26 lbs. of 4.4% milk is ration when the first test was , it is a question as to how long ould continue this production on ld ration without drawing heav- her own body for milk material. ration is cheap—too cheap in the run. When you get a properly ced ration that costs around 30 a day, that is about as cheap economically possible when the are not on pasture. Now, see Herbert worked that ration over lance it:

	Lbs. Fed	Lbs. Protein	Lbs. T. D. N.	Cost
a	10	1.06	5.05	$0.09
	31	.33	5.04	.105
	2	.250	1.142	.031
d meal	1	.302	.8565	.025
y	4	.28	3.02	.062
	3	.194	1.312	.0525
		2.416	16.4305	.3553

u will notice he has 10 lbs. of ntrates. In reality he only fed bs. of this mixture, which brings ost down to a little better than nts. Not bad. The 10 lbs. given e ration indicate the proportions e concentrates mixture. Herbert ncreased the cost of the old ra- some, but look at the results— concentrates instead of two, means more variety and great- latability. Then he has brought at total digestible nutrients col- five pounds which brings it up requirements. The nutritive ra- r this ration is 1:6.2.

ereas Star was producing 1.14 f butterfat daily, we find that in following month she produced lbs. butterfat daily and held up during the entire period Herbert l, producing over a pound of but- a day.

haps you think there isn't h difference in butterfat produc- o pay for the extra feed. Her- answers by saying, "Wait 'til spring. We'll see what she does then. Star is pretty well along in her lactation period. We're building for her next lactation now. It's only fair to judge the results of better feeding by what she does at a similar stage in her next lactation." Herbert followed through by analyzing his results. Time has proved his conclusions correct.

There was one cow in the herd, Jewel, that showed a good increase in production under Herbert's management. During her first month on test Jewel produced 31.24 lbs. of butterfat. In July she produced 40.54 lbs. of butterfat, and in August held up to 39.5 lbs. of butterfat.

The herd was turned out to pasture May 12 and the ration for the next week consisted of 6 lbs. alfalfa hay, 5 lbs. commercial dairy feed, and 5 lbs. ground oats. This figured 1.53 lbs. protein and 10.38 lbs. total digestible nutrients at a cost of about 21 cents.

On July 1, Herbert mixed 200 lbs. ground oats, 300 lbs. hominy, 150 lbs. commercial dairy feed, 200 lbs. of bran, and 100 lbs. linseed meal, making 950 lbs. total. Herb figured that in a ton of this mixture there would be 252.5 lbs. of protein, costing 14.3 cents a pound, and 1,473 lbs. of total digestible nutrients, costing 2.47 cents a pound.

In another ration mixed July 17, Herbert was able to cut down the cost of his protein to 11.8 cents a pound and his total digestible nutrients to 2.44 cents a pound. This ration contained 200 lbs. each of bran, gluten feed, ground oats, and commercial dairy feed, and 100 lbs. each of hominy and linseed meal.

The ration mixed August 4, contained 300 lbs. of a combination of corn and oats, 300 lbs. bran, 200 lbs. gluten feed, 100 lbs. each commercial dairy feed, and linseed meal. The protein cost 11.23 cents a pound and the total digestible nutrients cost 1.785 cents a pound.

Thus Herbert cut down the cost of the protein he was feeding the cows from 14.3 cents a pound to 11.2 cents a pound (3 cents a pound) and the cost of total digestible nutrients from 2.47 cents a pound to 1.78 cents a pound.

What Herbert Wisch has done to improve herd management at home can be done by other farm boys. Herbert makes play out of work. He has vision, ambition, and perseverance, three essentials for success. Following through wins ball games. It also wins in the game of life. Here's to all farm boys who follow through.

Our Review Column

egular feature of the junior department, ng the contents of Hoard's Dairyman previous issue. Let's talk it over.]

the March 25th issue are the ading articles of two interest- series—"Trailing Holsteins to America" and "The Breeds of Cattle."

ere did the Jersey breed origi- On the Island of Jersey, the t of the group of Channel Is- which lie between England and e. (See page 308.)

en was the first importation to America? In 1850, by r, Buck, Norton, and others in Connecticut.

w large is the Jersey? It is the st of the major dairy breeds. alves weigh from 40 to 75 lbs. th, mature cows average about bs., and mature bulls average 1,500 lbs.

y should the dairy farmer feel 926 was kind to him? Because the average profits above feed cost were the largest they have been for some years. (See page 310.)

Name the leading Register of Merit sire. Pogis 99th of Hood Farm has 115 R. of M. daughters.

What was the 1926 cow population of the U. S.? The number of cows in the United States has decreased from 22,481,000 cows on January 1, 1925, to 21,824,000 January 1, 1927, a decrease of 675,000 head in 2 years.

What have the farmers of Shelby County, Kentucky, learned about soy beans? That the right variety of soy bean hay is an excellent substitute for red clover in feeding dairy cows. (See page 322.)

How can thumps in pigs be prevented? The best known way is to force the little fellows to take exercise, and give them as much direct sunlight as possible. (See page 347.)

Why does Charles H. Chesley feed cod liver oil to his flock? Because he finds it one of the best preventives for disease and trouble in chickens. (See page 352.)

How does he feed the oil? The last feeding of scratch grain fed just before dark each day is moistened with the cod liver oil. For young chicks the rate is one pint of cod liver oil for every 500 chicks and for the laying flock it is one pint for every 100 birds.

Little Talks for Juniors

Smiles. What is a better grouch chaser than a smile? Two smiles. When you're feeling kind of blue, and the world looks upside down to you, try a smile. For the fellow really worth while is the fellow who can smile when things don't look their best. If you doubt, put it to the test.

Good fences bring about better farming resulting in better crops at lower cost. They save freight and hauling costs because crops are marketed as pork, beef, eggs, wool and dairy products. They distribute the work and save hired labor. Decide now to make Super-Zinced Fences help you make bigger profits for this year and many years.

SuperZinc-ed REG. TRADE MARK

Pittsburgh Perfect and Columbia Fences

repay their cost many times over because they modernize the farm, permit diversified farming, increase farm profits and add to the value of the property. They are made in our own mills from the finest steel and are protected against rust by the heaviest armor of zinc that can be successfully bonded to wire.

Super-Zinced Fences are guaranteed unexcelled in quality and durability, and meet every need for farm, poultry, garden and lawn. They give 100% protection and their great durability means lower cost per year of service. Write for catalogue and the new vest pocket booklet "Farm Records"; both FREE.

Good Fence *did this*

Red Strand "Galvannealed" Square Deal Fence

will help do this for you, too. It is a copper-bearing, heavier zinc coated fence that will far outlast the old-fashioned kind. It is hog-tight, bull-proof, good-looking. With it you can hog down; save fallen grain; missed corn; rotate crops, etc., at a good profit. Carl Schultz, Russell, N. D., says: "Diversified farming and good fences will give an income during crop failures as well as in good years."

Cut corn feed from 11 to 8½ bu. per 100lb. of pork for C. R. Pinkney, Fairmont, N. D. Made $3100.00 on sheep and goats in less than one year for J. N. Simpson, Eden, Tex. Made $40.00 per acre extra profit on hogs and lambs for Ralph Richards, Fairbank, Ia. Increased rent $250.00 per quarter for Joseph Hyke, Bowman, N. D. Brought 10001b. of pork on a 10 acre field after 600 bu. of corn had been husked out for Dr. G. W. Hawkins, Salisbury, Mo.

You know these things: But just to refresh your memory, send for booklet that tells how to fence for profit; another that shows how to test fence wire; and a catalog that shows all kinds of fence. Ask your dealer for these and Red Strand fence prices—or write to us.

We pay cash on delivery!

YOUR collection problems — anxieties over shipments to distant agents—uncertainties as to the amount of returns —are all abolished when you plan your delivery of cream to Armour and Company. Your returns are in immediate cash!

Armour and Company has built up an enormous dairy produce business that is expanding continuously with the increasing popularity of such brands as Cloverbloom.

Armour is able to buy on a fair cash basis because we can market fresh dairy produce—such as butter, eggs, dressed poultry — to all parts of the United States by means of our efficient refrigerator-car service. We draw our supplies direct from dairyman and farmer, *providing them with an uninterrupted cash market all through the year!* We find your markets through the co-ordinated efforts of an army of 60,000 skilled workers.

ARMOUR AND COMPANY

Chicago

We Needed One and So Do You

Many times at sales, farmers' meetings, on the street, in hotels, on trains and even at dances we have been asked for information regarding the Hoard's Dairyman herd. We missed many sales because we could not give our friends and new acquaintances all the information they wanted in definite form. In order to "be prepared" for these emergencies we planned the Hoard's Dairyman Vest Pocket Herd Book. The demand for them is exceeding our highest expectations The investment of $2.00 will come back to you many times and the satisfaction of having "your figgers" right handy is worth much more than the cost of the book.

Will accommodate 100 head. Loose leaves (easy to remove but firm during use); good leather cover; index, sketches, records breeding, service records, gestation table and blank pages for memoranda. All sent postpaid for $2.00.

A BOOK YOU WILL CARRY EVERY DAY

HOARD'S DAIRYMAN, Fort Atkinson, Wisconsin

DAIRY MARKET NEWS

Connecticut March Milk

The Connecticut Milk Producers' Association announces the following prices for Grade B milk delivered during March at market milk centers:

All milk sold in fluid form, 9.5 cents per quart for 4 per cent milk, and 4 cents per point allowed for other tests; all milk made into cream that is sold in fluid form, 10 cents per pound fat above the average monthly price of 92-score butter on the Boston market; all milk made into butter, at a price per pound fat equal to the month's average on 92-score butter in Boston.

Imports and foreign offerings were the primary cause of a recession of six cents the middle of March, the sharp advance being due to a well maintained demand unusually small supplies available. Storage and production are below last year.

ne Feed Market Situation

By the Grain, Hay and Feed Market News
ice, U. S. Department of Agriculture.)

arch 25—Generally mild weather and de-
ng prices for feed grains weakened the
ket for feedstuffs the latter part of March
prices of most feeds worked somewhat
r. Buying by retailers continued on a
l to mouth basis both because of the ap-
ch of pasturage in the more southern
s and because of lower prices of corn and
Pastures and other vegetation in the
ral and southern states are about two to
weeks ahead of an average season, al-
gh recent cold weather has checked
th in some areas.
oduction of wheat feeds continues of only
volume but the output has been fully
l to the limited consuming demand and
s have made slight declines in the past
weeks. Production was increased the sec-
week in March but with recent declines
ne wheat market millers complain of dull-
in the flour market.
re liberal offers of cottonseed meal from
ers, together with efforts of some resell-
o dispose of their holdings, forced prices
his feed about $1.50 lower than early in
h. Some mills withdrew their quotations
the government report showed a smaller
n crop than the estimate made in Decem-
and the volume of trading was reported
light. Prices of cottonseed meal, however, are near the level of a year ago and although the stocks of meal in crushers' hands on March 1 were smaller this year than last, yet crushers had about 10 per cent more seed on hand at this time in 1927 than in 1926.

About 7 per cent more cake and meal was produced in the seven months, August—February, this season than in the corresponding time last season, but about 27 per cent more was shipped out, reducing the stocks on hand March 1 to around 154,000 tons compared with 357,000 a year ago.

Linseed meal has declined slightly in sympathy with other feeds. The output of linseed cake and meal has been limited because of a rather slow demand for linseed oil. Export inquiry was slack in eastern markets and with a slow domestic demand offerings are liberal. Prices held relatively steady in the Central West largely because the output was being applied on contracts. Production at Minneapolis continued light and a few cars of linseed meal have recently been shipped into this market from outside mills.

Prices of hominy feed have worked sharply lower at most markets in sympathy with the weakness in corn prices. Offerings in eastern markets have been liberal and there was practically no demand for yellow hominy feed at Buffalo. Offerings of this feed were limited at Omaha but the Cincinnati market was relatively stronger than other points.

Gluten feed quotations were unchanged but demand fell off. Offerings in eastern markets were liberal and resellers were finding it hard to make sales even at slight discounts under manufacturers' prices. Demand, however, seemed fair in the Central West and the output there appeared to be well absorbed.

Alfalfa meal quotations were reduced about 50c a ton at some markets in sympathy with the lower prices now prevailing in some grades of alfalfa hay but demand continued inactive. Mills in the Southwest have large stocks of both meal and of alfalfa hay on hand and hay dealers were of the opinion that there were fair amounts of alfalfa still to come forward from Colorado, much of which will be suitable for milling purposes.

Tankage quotations held unchanged at $75 a ton at the principal markets, and reports indicated that the limited offerings were being well absorbed.

	Boston	Buffalo	Philadelphia	Chicago	Minneapolis	Omaha

*Standard spring bran. Hard winter wheat bran was $34.50 at Philadelphia and $26.25 at Omaha.

Butter and Cheese in March

Butter markets in March were erratic, opening at 50 cents, rising to 52 cents on the 9th, falling to 46 cents on the 18th, and again reaching 52 cents on the 28th.

Butter markets at this season of the year are very sensitive to the supply and react quickly to any accumulation or rumor of increased supplies. The approach of increased production makes dealers hesitant to accumulate supplies over their immediate needs. This year the situation is aggravated by the ability of foreign butter to scale the tariff wall, both actual imports and offerings accounting largely for the declines that took place. These were temporary in their effect, and at the close of the month the sharp advance was due to a well maintained consumptive demand, to a storage supply that is unusually low, and to production being lighter than usual.

Cheese prices averaged 22.75 cents on the Wisconsin boards, registering a decline of a quarter of a cent during the month. This average is two cents under February, but is still nearly two cents above the average for March last year.

February Dry Milk

(From Report by U. S. Dept. of Agriculture)

The wholesale prices given below are based on reports from manufacturers governing actual sales f. o. b. factory during February:

Dry Skimmilk: Prices ranged from 7.5 cents to 12 cents for dry skimmilk in bulk, averaging 8.9 cents a pound for sales, totaling 5,937,760 lbs. When packed in one-pound cans the price reported was 32.1 cents a pound.

Dry Whole Milk: Prices ranged from 26.5 cents to 28.5 cents for dry whole milk, averaging 27.1 cents for sales totaling 431,029 lbs. When packed in one-pound cans the price reported was 48.5 cents a pound.

Dry Buttermilk: Prices ranged from 6 cents to 10.5 cents for dry buttermilk in bulk, averaging 9 cents a pound for sales totaling 2,276,316 lbs. When packed in one-pound cans the price reported was 10.9 cents a pound.

League February Price

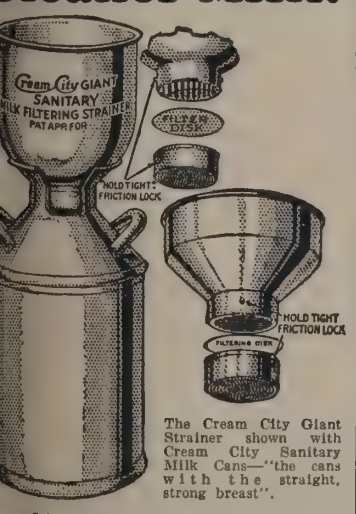
The Dairymen's League of New York paid a net pool price of $2.67 per hundred pounds 3.5 per cent milk in the 201—210-mile zone.

For calf feeding

¾ of a pound of

DRY SKIM MILK

in a gallon (8 lbs.) of water equals fresh skim milk for calf feeding.



With the "minimum milk method," using dry skim milk, the man who sells whole milk can raise heifer calves from his best cows.

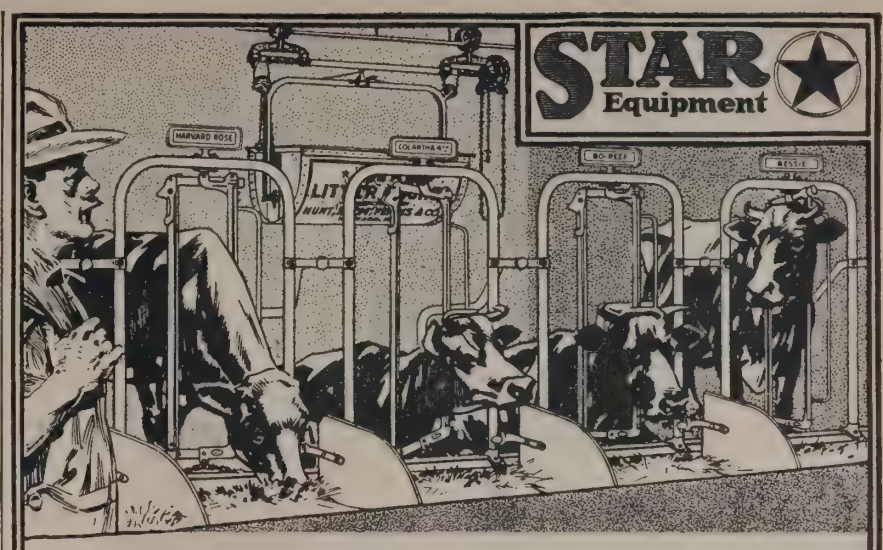
Write today for proven feeding suggestions (Bulletin 301) and where to buy dry skim milk. Please give number of calves you have to feed.

AMERICAN DRY MILK INSTITUTE
A Non-profit Association of Manufacturers
160 North LaSalle St., Room 720-A
CHICAGO

Poultry Raisers: Dry skim milk is excellent also for poultry; one lb. of it to 10 pints of water or dry in mash. Ask for Bulletin 201.

More Profits from Cleaner Milk!

The Cream City Giant Strainer shown with Cream City Sanitary Milk Cans—"the cans with the straight, strong breast".



Two 14-quart pails can be poured into the Giant at one time

The Cream City Giant actually filters the milk, removing every particle of foreign matter. Contamination is removed at its source—pure milk can be kept sweet much longer.

Large, strong, seamless. Heavily retinned—indestructible. Two styles. The Giant for large production—No. 1090 for the small farmer. Both are easy to keep clean and sanitary.

Get bigger sweet milk profits!

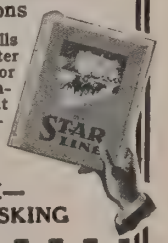
No Wonder They All Do So Well

Such comfort, safety, cleanliness and health are bound to bring results. In Star Stalls there's no crowding—no trampled udders. Smooth, one-piece stall arches cut out dark corners, cracks, crevices and dirt catchers where filth and disease can hide. Air and light reach every spot. The strongest of stanchions hold the cows safe.

They lie down, get up, turn to lick or look behind as easy as in the pasture. Never nervous, tired or sick, they look well, feel well and do well.



Star Equipment not only prevents dirt, dampness, dead air pockets, waste, accidents and disease that wipe out profits but it saves you time, feed, labor and countless steps.

NEW STAR RUST SHIELD DOUBLES LIFE OF STALL

This new feature prevents partitions rusting off at the floor line. Star Curb Clamp and assembled stalls save 50c to $1.50 per stall installation expense.

Everyday use in thousands of barns proves the value of other practical features of Star Stalls Pens, Water Bowls, Litter Carriers, Hay Carriers, Door Hangers, Ventilators and other specialties. They cut out work and worry, lower production costs and increase profits. All are described in our

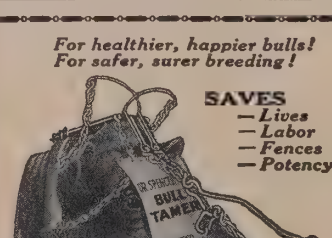
A Necessity — Not a Luxury

Floors of Circle A Cork Brick are not "fancy" floors for "fancy" barns, but common-sense, good-business floors for any barn where cows are worth keeping up to "top notch" in health and productivity.

Circle A Cork Brick make *warm* floors, *dry* floors, *nonabsorbent* and *sanitary* floors. They make floors that cows can't *slip* on. They protect from chill and dampness, from disease and accident—a safeguard against garget and rheumatism and against strains and "bunchy" joints.



That isn't luxury. It is good business —common-sense protection for your investment in good cows.

Write for the book, "Circle A Cork Brick Floors," and a sample. ARMSTRONG CORK & INSULATION COMPANY, *Division of Armstrong Cork Company, 112 Twenty-fourth Street, Pittsburgh, Pa.*

Comparing Practice and Results

HOARD'S DAIRYMAN:—While making my regular visit to each member of the Denmark Association of Wisconsin, I compared the results obtained this year with those obtained last year. I noticed that the average cow in the herds that were fed grain in the summer time was producing heavier compared to last winter's production than were those in the herds that were not fed grain last summer.

There is one herd in the association that increased its average production from 262 pounds fat in 1923 to 336 pounds in 1926, or 74 lbs. per cow. The following table shows the consumption of feed and profit over feed cost with fat figured at 54 cents a pound:

	Silage	Hay	Grain	Feed cost	Profit
	Lbs.	Lbs.	Lbs.		
1923	8,913	2,652	1,483	$64.17	$ 77.42
1926	5,992	2,007	1,834	68.87	112.46

The total cost of roughage was $1.21 less in 1926, but the additional 351 lbs. grain cost $5.91 more. This made the average cost of feed $4.70 higher, but the increased production provided $35.04 more profit per cow over feed. This splendid increase was brought about through careful weeding of lowest producing cows, continued feeding of a properly balanced ration, supplementing poor pastures with a sufficient allowance of grain, and giving each cow more individual attention.

MANNING H. NELSON, Tester.

Garget and Stalls

HOARD'S DAIRYMAN:—We have recently had considerable udder trouble in the Poynette Association of Wisconsin. Some of it is of a minor nature, but the larger portion is of serious importance.

In many cases I believe what is called garget is due to some injury by a neighboring cow. I have seen cows lying down side by side, then one of them changes her posi and in so doing kicks the other's der. Other times I have noticed cow lying down and her next ne bor standing with her foot danger ly close to her teats. A cow's u is sensitive and a blow from a may cause swelling and hardnes the udder. This is so simply quickly enacted that the milker next morning wonders what happ to a part of the udder.

An 18- to 24-inch plank set on between each cow will prevent ing of one cow by another, unless is a veteran "fence viewer." plank may be wired to the steel sion, or clipped on fore and aft. is simplicity itself, and quite a s factory and cheap preventive. old type of individual stalls boa as high as the cow should have retained. Perhaps their modifie installation would save many dol An individual stall is best anyway the modern method of stabling is in 95% of cases only s individual.

When a cow's udder is inflame is well to feed a light grain ratio bran, cutting down on silage keeping the udder from becor chilled. Rub with unsalted lar

ous causes, but new members have been enrolled to take their places. Some of the farmers that withdrew did so because they sold their herd, and some, as most people do, expected too much from the work in too short a time. At present the association is running at full capacity and is getting some very satisfactory results.

The following will give a good idea of some of the profitable work the association is doing: One farmer after entering the association with a herd of 23 cows found that he was overfeeding his cows. Upon balancing his ration he saved $150 in four months' time on feed alone. The year before the association was organized, another farmer sold his herd except for one cow which was culled back by the buyer. He later bought some more cows and went back into the dairy business. Upon having his cows tested he found that the cow that was culled back as no good when he sold proved to be his most profitable cow in the herd of twenty.

T. H. ROYDER, Tester.

Write the C. T. A. Editor, Hoard's Dairyman, for our prize offer to testers for monthly and annual reports.

Missouri's Leading Tester

Missouri's champion cow tester in 1926 was Harold Harper of the M.-M.-B.-M. Association. Because of his outstanding work in improving

MISSOURI WINNING TESTERS
Left to right: Gilbert Froning, bronze medal winner; Harold Harper, gold medal winner; and V. L. Gregg, silver medal winner.

dairy conditions in his section of the state, Mr. Harper was chosen by the State Dairy Association as the winner of the gold medal awarded each year by the Blue Valley Creamery Institute.

The testers making the second and third best records were Vernon L. Gregg of the Clay County Association, and Gilbert Froning of the Lafayette—Saline Association. The awards were based on a score card covering feeding and management, feeds grown, pure-bred sires used, boarder cows sent to the stockyards, care and handling of milk and cream, diseases checked, care of manure, meetings held and membership obtained, and promptness, accuracy, and neatness in making reports.

The outstanding record of dairy improvement accomplishments made in Mr. Harper's association in the past year included the weighing of milk from each cow daily by 22 members throughout the year; the feeding of well balanced dairy rations every day in 1926; and the checking of contagious abortion in 201 cows in 11 herds. In addition, 12 herds were tested for tuberculosis; soils on 17 farms, totaling 424 acres, were tested for acidity, which called for the use of eight carloads of lime to sweeten a part of these soils as the first step in growing legumes successfully. During the year also 20 silos were filled by members of the association; 17 members grew two acres or more each of legumes for each animal kept; two new 10-acre fields of alfalfa were established; two dairy calf clubs organized; and two milking machines purchased.—Blue Valley Institute.

Protein in the Ration

HOARD'S DAIRYMAN:—In the February 10th issue of Hoard's Dairyman is a statement made by C. M. Wagner of the Washington Association of Michigan which well bears some investigation. He says it is not necessary to feed "excessive" amounts of high protein feed for high production.

We are well aware that an excessive amount of protein is not necessary. We know, however, that a pound of milk contains a certain amount of the several ingredients and that a cow must consume just that much, and a little more, for body maintenance.

You cannot run barley through a mill and get linseed meal. The production of 70 lbs. of butterfat in a month on a 10.8% ration would require an excessive amount of feed. This would be more injurious to her than the desired amont of protein; in fact, it is doubtful if a cow could consume enough of a 10.8% ration to produce that much butterfat.

It would be interesting to know what the other members of the Washington Association are feeding. We would naturally expect to find them all feeding nothing but home-grown grains, providing they heed the advice of their tester. We would like to know just what kinds and amounts of feed were given this cow.

Wisconsin. V. PETERSON, Tester.

Grain on Pasture

Nelson Omans fed grain to his cows while they were on pasture in the year 1925. Nelson is a member in the old Newaygo Cow Testing Association of Michigan. As a matter of experiment this herd was not fed grain while on pasture during 1926. The results obtained for this herd of cows shows that the average production per cow decreased 63 pounds butterfat. There were 17 cows in this herd, which would make a loss of 1,071 pounds butterfat. Crediting this amount of fat at 40c per pound would value it at $428.40.

Surely Mr. Omans' experience in not feeding a few dollars' worth of grain to his cows while on pasture proves the expensiveness of neglecting to feed cows to their proper capacity.—A. C. BALTZER.

Value of the Milk Sheet

HOARD'S DAIRYMAN:—We have been discussing in the North Berrien Association of Michigan whether it pays to keep daily milk records; nine of the members were keeping daily records and five others started to keep them three months ago. The 14 members that kept daily milk records made 8.7 lbs. butterfat more per cow in the three months than the other members. They did it largely by changing the amount of feed according to the daily or weekly milk flow. IVAN IVERSEN, Tester.

Try This Strainer for 10 Days

At Our Risk

Dr. Clark's PURITY Milk Strainer is the only strainer on the market that is *guaranteed to remove all the dust, dirt and sediment from your milk.*

Unless milk is clean, it won't test Grade "A" regardless of the percentage of butter fat—that's why thousands of farmers and dairymen who use PURITY strainers get more money for their milk. Dr. Clark's Purity Strainer is simple to use—strains quickly and is easy to clean, saves time—saves labor—insures absolutely clean milk. Made in two sizes—10 qt. and 18 qt. Sold by good dealers everywhere.

Write for 10 Day Test Offer

Send us your name and address and we will send you descriptive literature and full particulars of our "10 Day Test Offer"—an offer that enables you to prove the value of PURITY strainers with a money back guarantee if it fails to do all we claim for it. Write today. (6)

PURITY STAMPING CO.
Dept. Q6 Battle Creek, Mich.

DR. CLARK'S Purity MILK STRAINER

After the calf is born

is when the cow *needs pure salt most*

INVESTIGATION has shown that immediately after calving time, cows are in particular need of salt. The milk flow then is greatest and lack of the right salt soon reflects itself in the distress of the animal.

Cattle, like all animals, know best when they need salt — and how much. But salt must be pure and pleasant to the taste or they will not satisfy their desire for it.

For that reason, many farmers and stockraisers keep Diamond Crystal handy in the barnyard and pen. They have found the stock will regularly and naturally visit the salt pile and eat all they require because it is pure, mild-tasting salt. It's the right salt to feed at any time—it assures good condition and better production.

There is a Diamond Crystal Salt for every farm use—for live-stock, for curing meats, for table and for cooking, for canning, for butter and cheese-making. Ask for Diamond Crystal at the store where you trade.

"The Salt that's all Salt."

Brings Profit and Contentment

A. M. CHALLEY, NORTH DAKOTA

"LET'S stop here," suggested Frank Svoboda, county agent of Eddy County, N. D., as we were nearing the farm of Peter Smith, North Dakota. "Mr. Smith's well improved farm is a true indication of success and I am sure you will be interested in seeing his Guernsey herd and hearing the story he has to tell." We stopped and fortunately found Mr. Smith at home and not too busy

PETER SMITH

to show us about and answer numerous questions "fired" at him.

Mr. Smith came to Eddy County in 1895. His total assets consisted of a willingness to work and make the most of the opportunities which this new country offered. He borrowed sufficient money to buy a rather scanty outfit of horses and machinery with which to turn the virgin prairie and make it ready for small grain crops. During his spare time he worked out in order to secure money enough to meet his living expenses. In the course of time he managed to pay back the money borrowed, and increased his farming operations until he reached the high point of 1,700 acres in small grain crops. "Some years this method of farming paid well, but always we were confronted with the possibility of crop failures. After all is said and done, it was a hazardous system of farming."

After fifteen years of small grain farming, Mr. Smith decided that live stock was necessary in conjunction with small grain farming to conserve soil fertility, control weeds, and make his farming operations safer in general. In 1913, he purchased three pure-bred Guernsey cows and a bull to add to the small herd of native cows which he had already established. From these as a foundation, he has built up his present herd consisting of 28 cows of milking age and young stock which brings the total to 65 in all. About two-thirds are registered Guernseys. During the past few years, there has been a good demand for dairy cattle and his sales of surplus stock have added materially to his returns. Ten herds of Guernseys have been started from stock sold by Mr. Smith to his neighbors.

When questioned regarding his cropping system at present, Mr. Smith commented, "We are still devoting a considerable acreage to small grain cash crops, but I would quit farming if I was forced to dispose of the cows." Of the 1,100 acres now comprising the farm, the following feed crops are raised: 60 acres of corn, 20 acres alfalfa, 20 acres sweet clover, 300 acres prairie hay land, 50 acres barley, 160 acres oats, 25 acres speltz, and 160 acres prairie pasture. Wheat is grown as the chief cash crop and it has been possible to secure an increased yield of five bushels per acre on land that has been manured or used for corn.

Alfalfa hay and corn silage form the basis of the dairy cow ration. Alfalfa yields an average of three tons of excellent hay per acre each year and the 100-ton silo is usually filled from 20 acres of corn. "I could not do well without these two roughage feeds," was Mr. Smith's comment. They are supplemented with ground oats, barley, and speltz, the amount of grain fed depending upon the production of the cow. We have never found it necessary to buy feeds to make a balanced ration since we started feeding alfalfa hay and corn silage. Sweet clover hay properly cured has proven a valuable feed for Mr. Smith, but he prefers alfalfa for hay and has not used sweet clover for pasture because of the large amount of prairie pasture that is available at a low cost. However, he is of the opinion that on most farms sweet clover should be utilized as a pasture crop and in many cases as a hay crop. Mr. Smith's milking herd receives grain the year around for he is satisfied that a high producing cow will not do her best on pasture grass alone. There are times when pasture is at its best, that little grain is necessary, but at other times the cows make increased profit when a considerable amount of grain is fed.

The young stock is well grown out in an economical way. The calves receive whole milk for a period of two weeks, then they are gradually put on skimmilk by substituting a little for part of the whole milk each day. At the end of six weeks they are receiving skimmilk entirely and kept on it until they are six to eight months old. They are fed whole oats in addition to the milk. The yearling heifers are kept in the main barn during the first winter and fed hay and some grain. During the second winter, the heifers are kept in an adjoining shed and fed hay and grain until they are

e improvements on Mr. Smith's way Farm" are of the best. His rn house was built in 1918 at a of $6,000 and the barn soon af- t a cost of $10,000. The barn is ped in the most modern way, steel stanchions and pens, drink- ups, and milking machine.

nen asked regarding farm help, Smith remarked that he had little to worry in regard to this. e are four husky Smith boys who been contented to stay on the and help make things go. In the boys were taken into a part- nip and since that time have tak- er the active management of the . "I have not insisted that the stay at home, but they are will- o do so for they are as much in- ted as I am through our part- nip deal."

nat is your candid opinion as to pportunity a young man has to ed with dairy cows in North Da- ? And what is your advice to the ner? These were among the ions asked. "My cows have nev- ailed to return a profit. This try is well adapted to the grow- of feed crops and it would seem anyone with the willingness to can be successful. My advice to beginner would be to start with e cows which show dairy charac- tics to some extent, select a good -bred bull of the breed he likes and in this way develop a better He should never lose sight of act that proper feeding and care equally as important as breed-

. Smith is 55 years old, is in the of health, and satisfied to remain ne farm for he has worked since beginning with a farm home and mfortable living as his objects. Smith has worked equally hard hieve these things and she also is fied to remain on the farm and them.

Red and White Holsteins in Holland

HOARD'S DAIRYMAN:—As I sometimes see a question in your paper about red and white Holstein-Friesians, I am sending you a photograph of a pure-bred registered Friesian bull, Willem, that is red and white. He has taken five first prizes at cattle shows in Friesland. His dam gave, in 305 days, 13,226 lbs. of 3.6% milk, or 479 lbs. fat. His sire's dam gave, in 297 days, 12,837 lbs. of 3.6% milk, or 464 lbs. fat.

"WILLEM"—A RED AND WHITE HOLSTEIN OF HOLLAND

Cows in Friesland are kept six months on pasture, with nothing but grass to eat. During the winter six months, they are fed native hay and concentrated feeds. Cows are never milked more than twice a day, may not be milked more than 320 days, and must carry a calf every year.

Holland. W. G. KOOPMANS.

Registering Grade Cows

HOARD'S DAIRYMAN:—History tells us that Noah loaded one pair of cattle, male and female, into the Ark and that all others perished. Therefore, all cattle are descended from this pair. Each and every breed now recorded as pure-bred had its origin at one time by recording non-pedigreed animals as foundation stock.

Professor Thomas Shaw, formerly of the University of Minnesota and considered a leading authority on the live stock industry, contributed an article on "The Greatest Mistake in Breeding" to the National Stockman and Farmer of May 15, 1915.

"It may be asked," he said, "what is the greatest mistake in breeding? I answer, "Making it impossible to breed up live stock of the grade order so that it will become eligible for record."

"This fact," continues Professor Shaw, "will be disputed, and it will be vigorously disputed. Among breeders the great majority will be on the other side. This is evidenced in the fact that there is not an association in America of which the writer has cognizance that will admit to record animals which do not trace, in all their lines of ancestry, to animals that have been recorded. Notwithstanding that unanimity of testimony, I still cling to the belief that the greatest mistake in breeding in this country is that of making it impossible to so breed up grades that the time will come when they may be recorded as purely bred.

"Two strong reasons may be given why such breeding should be encouraged. One is that in certain lines of alien blood there is renovating power. A second is that the decision to make it impossible to so improve grades that they can be registered throws a wet blanket on all effort to so improve grade live stock that it may be recorded."

Speaking further with particular reference to the Shorthorns, but in language that will apply with equal force to any dairy breed, Professor Shaw said: "Our contention is that some form of registration should be adopted that would enable the breeders of Shorthorns of exceptional performance at the pail to record those animals. If it should be deemed inexpedient to record them in the American Shorthorn Record because of the shortness of the pedigree, some other form of registration is to be furnished. If the present rule of registration in the Shorthorn herdbook cannot be amended to admit these animals to registry, then the breeders of Shorthorns should not object to the establishment of such a registry. Can any good reason be given why they should object?"

When such an eminent authority as Professor Shaw comes out so emphatically in favor of registration for grade stock and it goes unheeded, it seems a waste of effort for others to agitate it. Professor Shaw characterizes it as "the greatest mistake in breeding." He had the foresight to see the possibilities of registering grades. The breeders of pure-bred cattle would be benefited the most, as it would create a demand for more and better pure-bred bulls.

Increase Pasturage *without* Increasing Pasture Acreage

by using

SEMESAN

MAKES SEEDS HEALTHY

NOW you can feed more cows from the same amount of land. You won't have to replant so often, and you won't have to use so much corn or forage seed. You'll get a more vigorous stand of thicker, darker green, deeper rooted corn, clover or grass.

All this simply by treating your seed corn with Semesan Jr. or your grass and clover seeds with Semesan, both disinfectants for fungous and bacterial diseases carried on the seed. The best of seed may carry one or more diseases that may destroy the seed germ or greatly retard its growth. A simple, inexpensive dust treatment with these Semesan antiseptics kills the germs clinging to the outside of the seed and protects the seed from infection by soil-borne diseases. Semesan and Semesan Jr. increase germination and improve quality and yields.

Don't overlook so powerful, so economical, so easily used an aid to better fodder or ensilage, soiling crops, pasturage and hay. The coupon will bring you full information. Mail it Now!

It Destroys Bacteria

STERILAC is used as a disinfectant to destroy the bacteria which make milk and various other food products spoil. Even disease organisms which are dangerous to health are destroyed with STERILAC.

Keeps Bacterial Count of Milk Low Through the use of STERILAC all external sources of contamination are controlled with the result that milk is produced having a minimum bacterial count.

Sterilac Keeps Milk from Spoiling To insure good keeping qualities milk prepared by the STERILAC method is immediately cooled below 60° F. Such milk is safe to use as food for infants and children.

In Demand Good, wholesome milk is always in demand. The STERILAC method of producing milk will help you to secure a good market for your product. It will help health officers provide citizens wholesome milk low in bacterial count.

Sterilac is Reliable You can depend on STERILAC as an aid to produce milk of the highest quality. STERILAC is just as valuable in creameries, cheese factories, ice cream factories, restaurants, hotels, butcher shops, hospitals and homes. It helps to keep these places scrupulously clean and provides every requirement of sanitation.

Sterilac Does Not Taint STERILAC is a chloramine substance which is an improvement of the Dakin preparation known to destroy bacteria, yeast and mold. It does not taint milk nor impart an odor. While STERILAC is powerful it is safe to use as a disinfectant. Even if some of the STERILAC solution should come in contact with milk or other food products it could not spoil them as food for humans. That is why STERILAC is safe to use and makes milk, etc., safe food.

Sterilac is Sold as Powder STERILAC is sold only in the form of a powder. There is no loss in strength on standing. Even STERILAC solution will keep for a long time without losing much of its strength. The cost of STERILAC is small compared with the enhanced value of the milk and other food products that are produced through its use as a sanitary agent.

Special Introductory Offer

of enough STERILAC to make 60 gallons of the strength used for ordinary sanitation $1.00. Complete directions enclosed.

Bovine Tuberculosis in Humans

(Continued from page 367)

mans, it is also responsible for many deaths from tuberculosis. How many, it is difficult to say. Different students and observers report different figures; Rosenau says about one-half of 1% of all deaths due to tuberculosis, and these mostly under the age of five years. It has been estimated that 10% of all deaths from tuberculosis in children under five are due to the cattle germs. In New York City, Dr. Park estimated that 300 children died each year from bovine infection, and there is no reason to believe that New York is worse in this respect than other large cities in our country. It would be a conservative estimate to say that approximately 10 per cent of deaths from tuberculosis are of the non-pulmonary forms of the disease which in a large proportion of the cases have been proven to be of the bovine type.

Sources of Bovine Tuberculosis in Humans

Bovine tubercle bacilli occur in milk directly as a result of tuberculosis of the udder, which it has been stated occurs in one to three out of every 1,000 cows. Chesley of Minnesota reports that "in 1,200 autopsies of reactors, udder tuberculosis was found in 5.75 per cent. In generalized tuberculosis the udder has been found to be affected in about 17 per cent."

But tubercle bacilli may occur in milk indirectly, through cow manure. With lung tuberculosis tubercle bacilli are coughed up, swallowed, and passed in the manure. The manure gets into the milk in many ways with which we are all familiar, carrying its tubercular germs with it.

The routes by which the bovine bacillus attacks the human body may be limited to a single one, namely the alimentary tract. From the alimentary tract the bacilli of tuberculosis are absorbed, at the same time as the food, through the intestinal wall into the lymph system, and thus are delivered into the blood. The glands in the abdomen connected with this absorption area are often infected, usually from the bovine type of bacillus. After a period of from one to several years these glandular infections may clear up, although they not infrequently so reduce resistance that death results from tuberculosis or some other disease, or they may cause several years of sickness and stunted growth with mental impairment. Once in the blood stream any tissue or part of the body is liable to infection either primarily or secondarily and we may have a rapidly fatal generalized tuberculosis.

Latent Tuberculosis in Adults

Behring in 1903 brought forward the theory that alimentary infection occurs in the early months of life. The tender mucous membrane of babies permits the bacilli to pass readily. The bacilli remain latent in the tissue and acquire increased activity later in life; and he thinks that all active tuberculosis in adult life may be due to infection with the bovine bacillus in infancy.

Rosenau says, "It is now believed that tuberculosis infection is usually received during childhood, but remains latent until adolescence or early adult life, when the disease becomes clinically apparent."

Bovine tuberculosis may yet be demonstrated to be the cause of much of our pulmonary tuberculosis and much of the tuberculosis of all forms which demonstrates itself among adults. Therefore, we humans are much concerned with the presence of tuberculosis in other animals, especially cattle from the public health standpoint.

Methods of Prevention

When discussing the question of bovine tuberculosis in humans, I would consider my paper unfinished if I did not say something about preventing it from occurring.

The proper pasteurization of milk will prevent the spread of bovine tuberculosis to humans. You will notice I use the word proper in connection with pasteurization. That means proper machinery that will heat every particle of the milk to 145 degrees and maintain that temperature in every particle of the milk for 30 minutes. It also means proper individuals who will see that proper machinery works and is allowed to work properly. It also means that there must be proper officials who will see that the proper individuals are able and compelled to make and allow the proper machinery to do its work.

Healthy Cows Also Needed

A great many dairymen, some of the public, and an occasional health officer have gotten it into their heads that we can do away with a lot of troublesome details of milk production and substitute pasteurization and everything will be all right. Pasteurization is a great factor of safety—but only a factor. The milk must be good milk to protect us in the event of accidents in operation or to the pasteurization machinery, because pasteurization is after all merely a mechanical device, not a moral obligation. In any event, pasteurization is hard to accomplish with a small local milk market and we must remember that over 50 per cent of the population of the United States lives in rural districts, farms, or communities under 2,500; and there, too, occur 60 per cent of the births.

Obviously we should try to eradicate tuberculosis from the cows and that is some job; and here again we are on controversial ground. There are those who maintain that the clinical method is best; that is, the elimination of obviously open cases of tuberculosis, both of the lungs and udder. I need only say now that in my opinion the system doesn't exist which will enable us to eliminate all or a sufficient proportion of tuberculous cows by this method.

The best method of eradicating tuberculosis from a herd is by the tuberculin test. Of course, it isn't 100 per cent efficient. One test will not spot every tubercular cow and as long as there is a cow present in a herd that has been in contact with a cow that was tubercular there is a possibility of that cow reacting on the next test and there is a possibility of that cow spreading infection. Eradication of tuberculosis from a herd is not a simple or easy matter, but that doesn't dispute the fact that tuberculin testing is the best method of eradicating tuberculosis from a herd; or excuse us for neglecting to use the procedure.

Picture Not All Sombre

I have stated some facts and expressed some opinions. I have not attempted to conceal facts; I have given the dark side. However, the picture is not entirely sombre, in fact it is very bright. It is not desirable that the public should be unduly alarmed so that they will not use milk and milk products; because it is just as necessary that they should consume more milk as it is that the

What Become of the Empt Tobacco Tin

"Say it with empties," seems to be the sentimer of certain pipe-smoke

Of course, to most people an tobacco tin is just somethi throw away. But there are tions.

Every so often some memb the Edgeworth Club writes in t of a novel use to which he pu Edgeworth "empties."

A railroad fireman started a p Edgeworth tins on the Americar ert as a sort of shrine, he says. engers and employees, accordi his story, caught the spirit an pile grew fast.

Another smoker writes from I that he has scattered Edgeworth along the Nile and succeeded in ing one in the innermost chamb a Pharaoh's tomb.

A telegraph operator says he Edgeworth tins as amplifiers fo Morse code that comes in ove various wires.

Still another use is brought to by Mr. L. C. Quinn of New York says:

New York City

Larus & Bro. Co.
Richmond, Va.
Gentlemen:

As a member of the Edgewor Club, I want to tell you of a lit scheme I have to help the ga along. When I take the last pipe from the blue can, I always set it in some conspicuous place where may be seen by passengers on t subway or elevated platforms, or an office window where passers may have their attention mut drawn to this very good smoking t bacco, which I have been using f eleven years. Maybe other members the Club would like to follow s when they have an opportunity.

Yours very truly,
L. C. Quinn.

If you do not already know, you be curious to find out just what of tobacco is put into these blue that arouses such kindly senti in the hearts of pipe-smokers.

To those who never tried E worth, we mak offer:

Let us send free sample Edgeworth so you may put the pipe test you like the ples, you'll Edgewo wherever whenever buy it, for it never changes in qu

Write your name and addre Larus & Brother Company, 15 S. Street, Richmond, Va.

We'll be grateful for the name address of your tobacco dealer, t you care to add them.

Edgeworth is sold in various to suit the needs and means o purchasers. Both Edgeworth Slice and Edgeworth Ready-Ru are packed in small, pocket-size ages, in handsome humidors ho a pound, and also in several hand between sizes.

To Retail Tobacco Merchants your jobber cannot supply you Edgeworth, Larus & Brother pany will gladly send you prepa parcel post a one- or two-dozen ton of any size of Edgeworth Slice or Edgeworth Ready-Ru for the same price you would pa jobber.

On your radio—tune in on WRVA, Richmond —the Edgeworth Station. Wave length 256 m

: should be safe milk. So the
t word should be a statement of
r:ress to show that where effort is
n e, good results are obtained.

generation or less ago it was
:rculosis which led diseases as the
se of death. Today tuberculosis
a fallen from first to sixth place in
h list.

Tuberculosis," says Dr. C. H.
ro, "has been changing during the
few decades quite largely by
attentuation and the results of
education of the public. Thirty
rs ago the yearly deaths from tu-
culosis in each 100,000 persons
bered over 200; they are now
under 100. Tuberculosis is
aging and diminishing. The path-
ists of thirty years ago showed
in from 71 to 91 per cent of all
minations after death there was
lence of tuberculous disease at
e period of life. The patholo-
s of today show that this inci-
ce has diminished from 10 to 20
cent. The common knowledge
cerning the care of those who
e the disease prevents its distribu-
and tends to a much higher rate
recovery than years ago. It is
sible to almost eliminate the dis-
e in human beings, as well as in
mals."

n Minnesota the death rate from
erculosis was reduced from 107.5
100,000 to 69.67 in eight years;
lung tuberculosis rate from 86.7
59.4, while other forms which in-
de practically all of the bovine
es from 20.8 to 10.27. That is,
pulmonary rate was reduced 31
cent while the other forms were
uced 50 per cent; which means
t the reduction where the bovine
ms are concerned is not only keep-
pace with the reduction in hu-
n forms but it is away ahead. Bo-
e tuberculosis is not overlooked
neglected in Minnesota, which is
saying that we are doing all that
should either.

Fewer Tubercular Cripples

There is another thought. The
ve figures are evidence of prog-
s made in reducing deaths from
erculosis. But tuberculosis does
always kill, sometimes it disfig-
s, cripples, and otherwise inca-
itates; and such cases are also be-
materially prevented or reduced.
ere are some of you here old
ough to know I speak the truth
en I say that the number of
rred necks, humped backs, para-
ed and crippled limbs are nothing
what they used to be. They used
be common sights on our streets,
w we seldom see them. As evi-
ice of this, out of 5,523 operations
ough the Mayo clinic in 1907
re were 70 for tubercular glands
the neck. In 1924 out of 23,628
erations, only 66 were for tuber-
ar glands of the neck,—a reduc-
n from 1.2 per cent to .28 per
t, or just about one-fifth as
ny; in other words, fewer out of
628 than out of 5,523.

In Minnesota, by care, tuberculin
t, and elimination, bovine tuber-
osis was reduced 75 per cent in
years, from 9.4 per cent to 2.4
cent. Now great endeavor is be-
made to stamp out tuberculosis
m the dairy herds county by coun-
Many of the counties have made
ent appropriations for this pur-
se.—From address delivered be-
e the Midwestern Tuberculosis
nference.

South Dakota Holstein Meeting

The annual meeting of the South
kota Holstein-Friesian Association
s held at State College at Brook-
gs March third during Farmers'
Week. A majority of the fifty members were in attendance and the spirited discussions and talks indicated a keen interest in matters pertaining to the breeding of Holsteins.

First a joint meeting of the Holstein and Guernsey breeders and dairymen was held. C. Larsen, Dean of the Division of Agriculture, in his address of welcome emphasized the value of group action and co-operation not only within the breed but between breeds and with all dairy interests. Frank B. Astroth of the American Jersey Cattle Club emphasized the value of continued cow testing work year after year, for the breeder as well as the dairyman.

The matter of selective registration was discussed at length by different breeders. Various opinions were suggested, a variety of plans were projected, and the spirit of the members seemed to be that it is a problem which will have to be met in some manner in the future.

Mr. Frank Johnson was reelected president and A. F. Test was also reelected secretary and treasurer. Both were recommended as delegates to the next annual convention of the National Association to be held in Springfield, Mass., June 1, 1927.

Owing to the splendid increase in interest shown in Holsteins by dairy calf club members at the South Dakota State Fair last fall, the meeting voted to continue its activity along this line. Each club member showing a Holstein heifer at the State Fair will receive a premium of five dollars.

A. F. TEST, Sec.

Why Camel leads the world

GOODNESS has made Camels the leader of the world that they are today. Goodness means the quality of the tobaccos from which they are made, the skill with which the tobaccos are blended to bring out the fragrance, to produce the mildness, to give that subtle quality and taste that smokers find only in Camel.

Goodness means such a standard of uniformity that the billionth or the trillionth Camel is sure to be just as good as the first. It means the honesty, the truthfulness, the sincerity of purpose to make and keep Camel the leader—the cigarette most preferred by the greatest number.

Have a Camel!

CLOVER LAWN FARM, Arthur Puls, ALLENTON, WISCONSIN

600 REGISTERED HOLSTEINS To Be Sold April 12 to 22

(*Inclusive*)
BY THE

Wisconsin Holstein Sales Association

breeders from seventeen leading Holstein Counties, co-operating.

This is the greatest line-up of practical producing Holsteins ever assembled for ten consecutive days selling. For the carload lot buyer, provision has been made to enable him to concentrate cattle at any of the selling points listed below. These sales are offering a wonderful opportunity for replacement purposes.

There will be **125 BULLS,** many of them out of tested dams with records up to 30 and 1,000 lbs. There will be **300 COWS** from two years to full age. Many of these animals have creditable records and are out of the very best herds in the state of Wisconsin. There are also cows with good cow testing association records. There will be **175 HEIFERS** under two years. These heifers are good individuals from high producing, well bred herds.

The cattle to be sold in these sales come from the foremost Holstein breeding communities and counties in the state, many of them from Area T. B. tested counties, many of them from Federal and State Accredited herds, and all will have been tuberculin tested before being sold in the sales.

Order in which the Sales will be held is as follows:

April 13—LAKE MILLS—70 head
Breeders from Rock, Columbia, and Jefferson Counties co-operating.

April 13-14—MADISON—125 head
Breeders from Dane, Iowa, and Richland Counties co-operating.

April 15—REEDSBURG—70 head
Breeders from Sauk County.

April 16— MAUSTON— 70 head
Breeders from Juneau County.

April 18-19—Fond du Lac—125 head
Breeders from Fond du Lac, Washington, Waupaca, Winnebago, Sheboygan and Manitowoc Counties co-operating.

April 20—MARSHFIELD—70 head
Breeders from Wood and Marathon Counties co-operating.

Poultry on the Dairy Farm

Better Quality

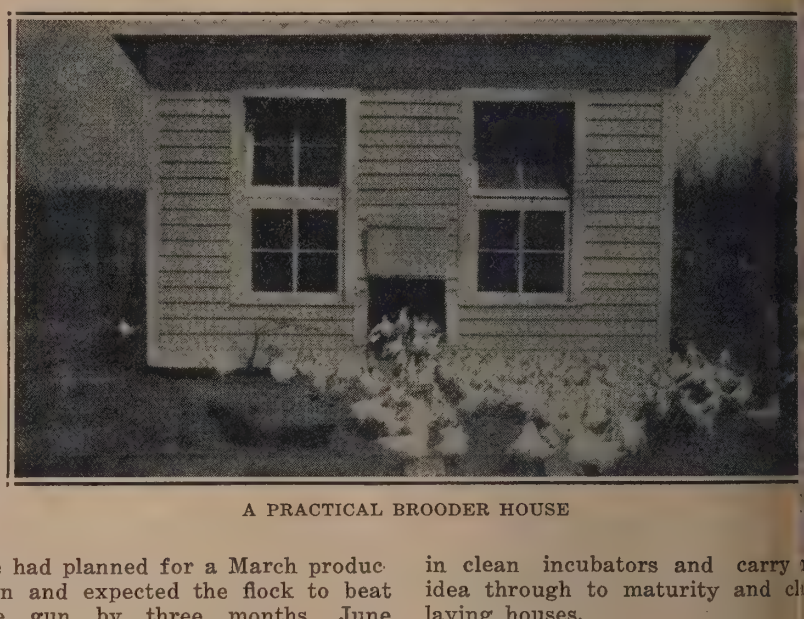
With the increased specialization during the last few years it is imperative that anything produced must be improved in quality. During the readjustment period good cattle were in demand. Each season the producers of quality seed grains can always obtain outlets. Most of the adverse complaint that we hear now and have heard comes from the producer of either fair or inferior quality produce that wants a quality price.

Just recently a friend complained because he did not obtain a winter production from his flock. The house was satisfactory, the ration was correct, and his management was about right. He even claimed early hatching and finally said that the chicks of a medium large breed were hatched late in June. The entire explanation was in that one statement. He had planned for a March production and expected the flock to beat the gun by three months. June hatching will only produce March layers. It cannot be otherwise.

Now is the time to plan the winter egg production.

First in that plan should be the ambition to replace the present laying flock in whole by well matured pullets. This fact applies particularly when the owner is interested only in egg production and does not plan on retaining the flock for breeders. It is needless to state that pullets will produce more economically and will return a higher net income than hens.

The pullets must be hatched early enough to be well matured and ready to start in October. They should at least reach a 50 per cent production by the middle of November. The earlier this point is reached the bet ter, except that a summer production must be discouraged when a sustained winter production is desired.



In one instance when the two flocks were carried in separate pens, the November production from pullets was 5.13 eggs per bird while the hens averaged 0.77 egg. In December the pullet average was 11.94 eggs and the hens 0.38 egg.

In another instance a flock in Douglas County showed the following comparative costs. These were based only on cost of feed and litter, not including labor, interest, ta and the other items that consti overhead:

Month	Pullets	Hen
January	13.1c per doz.	56c per
February	13⅜c per doz.	42½c per
March	11⅓c per doz.	12½c per
April	10¼c per doz.	10½c per

This gives one something to t about when trying to deterr which end of the horn they plan crawling through.

Second in consideration should a complete acknowledgment tha portable colony house is an abso necessity. The biggest single loss countered in chick rearing co from a lack of proper sanitation usually includes coccidiosis and testinal parasites. If a proper preciation of clean range for b from time of hatching to matu could be emphasized, we would n nearly realize its importance. P ably we should start with clean

A PRACTICAL BROODER HOUSE

In clean incubators and carry idea through to maturity and cl laying houses.

In the "good old days" of a do or more hens per farm, the prob of clean range was not a probl There were not enough head of p try per farm to cause any congest If there was a problem it was noticed because poultry did not resent a source of income.

With a manifold increase in p try population there was not any tempt made to increase the ra and contamination resulted. Pro bly if we had maintained the s proportion between area and num after enlarging the farm flocks as prevailed previously, the prob could have been solved.

Since the damage has been d we must make the best of it move out on clean range or rat consider the poultry in our regu rotation. The laying house does make a suitable brooding house.

A proportion should exist betw size of house and number of chi in brooding, the same as we fin ration in winter housing. In many instances all the chicks t can be put into a house is conside the correct number. Usually un this method the loss brings the t down to what is desired.

It is usually cheaper to start w what the house should carry e though they may seem lost for first few weeks. Growth during

first few weeks is rapid and the house may be overcrowded even before the broilers are removed.

As an instance: A baby chick will weigh about 1.4 oz. which means that 600 total about 50 lbs. In eight weeks they can average 27 oz. or a total of 1,000 lbs. This is 20 times their original weight.

A 56-lb. Jersey calf at birth, if making the same rate of growth, would make a 1,000-lb. heifer in two months.

Size of house is influenced by the amount of range which the chicks are allowed, the necessity of closely confining or free range, and several other factors. Just as a guide one can use the following table:

Size of house	Chicks
8' x 8'	100—150
8' x 12'	150—250
10' x 12'	250—350

Probably 400—450 chicks should be the maximum number brooded in one lot. Two small lots will return better results than one large one even when labor is considered. There is, apparently, a limit to which factory methods can be carried in chick management by the average caretaker. There are always exceptions.

Most of the plans call for a shed roof colony house with only a single wall construction. Paper is either used on the studding with matched siding or rough lumber may be used and covered with heavy roofing paper. This type of wall eliminates draft. Heat is not an essential since the stove supplies that need.

A double board floor with paper between is recommended. Not only a better type of floor construction is obtained, but the house will stand moving with this more rigid construction. A warm, dry, draft proof floor is a necessity.

The house is twelve feet deep and either eight or ten feet wide. A front elevation of seven feet and a rear elevation of 5 feet is adequate and allows the attendant room to work. There will be a few bumps but one gradually comes to a realization of the size and "stoops accordingly."

The twelve-foot depth allows the brooder to be placed at the rear of the house. With this arrangement the front portion can be kept at a lower temperature and is used as a feeding space. It is advisable to place the brooder to the extreme back of the house allowing only space to get between the canopy and the rear wall.

One universal error is occasioned by the use of a thermometer. Because the directions may call for a given temperature, the novice usually tries to carry that amount of heat regardless of what the chick demands may be. In most cases we would think that they were trying to brood thermometers rather than chicks because the thermometer is the only thing satisfied. Under average conditions better results would be obtained if there were no thermometer. Run the heat according to the action of the chicks.

Usually an excess of heat must be furnished. Poor results can be occasioned by overheating, the same as chilling, but the reverse usually prevails. Especially at night one should have enough heat supplied so that the chicks form a circle outside of the canopy. This allows for sufficient reserve so that when the temperature does drop toward morning, the circle can still move back toward the stove under the canopy and have a sufficient reserve supply. If they are getting the maximum when visited for the last time at night it means that they will be chilled before morning.

A chick guard is made of a galvanized strip about 18 inches wide and 6 or 8 feet long. Legs or strips are

FARROW CHIX FOR SUCCESS
WINTER EGGS

200 EGG STRAIN
BANKING
Buyers of Farrow Chix start banking their winter receipts sooner than raisers of unknown Chix.
Our 200 egg strain are positive winter layers
MORE WINTER EGGS
This is the cry of thousands of poultry raisers. When eggs are high and profits the greatest you need Farrow Chix to fill the egg basket. Our Star Matings White Leghorns—bred to produce 200 egg pullets—can do this for you. A few dozen eggs in winter will more than pay difference in cost of these chix and common stock. You can't get blood out of a turnip. Neither can you expect to have laying chix from non-laying hens. Be sure of winter eggs and order our Star Matings. They are winners in egg contests. They will win for you. Tancred, Hollywood, Barron blood lines. Chix from America's Wonder Layers.

bolted on this strip so that it will stand upright.

The range of vision of a newly hatched chick is very limited. They learn to feed by the sound of the material being dropped and probably locate themselves in respect to the stove by a sense of feeling. It is necessary to guard them against getting lost.

The guard acts ideally in that capacity since one or two can be placed around the front of and about 18 inches away from the stove. As the chicks develop the guard may be moved farther away permitting the chicks more range.

A second advantage of the use of this guard lies in the fact that it tends to cut off a floor draft since it is set right into the litter and also permits of a better circle around the stove. During the first couple of days the chicks will form a circle completely around the stove. Due to the windows being placed only on the south side, the light is obtained only from that direction, making that part of the brooder light and teaching the chicks to circle only at the back. With the guard in place the front portion is darkened and the chicks will form a more complete circle.

Corners should be banked. One may do this either by building a sloping bank with boards, eliminating the corners by the use of inch mesh wire or roofing paper, or making a cone or fan shaped bank with a grain sack nailed along the floor and either side up the wall to a point and pulled taut. All of these means have been used successfully. Do not take a chance on corners.

If clean range is available for the chicks it is necessary only to keep them housed long enough to accustom themselves to that amount of space. The guard is moved each day, permitting the chicks more range. After this, outdoor range can be supplied. It is a question of clean range rather than temperature that determines whether chicks must be confined or turned loose. It is necessary for most people to overcome the existing prejudice about chicks getting chilled outdoors. If the sun is shining, even though the temperature may seem low or there is snow on the ground, turn them out. As long as they don't huddle in a bunch outside but are broken to go back to the stove when cold, then growth will be satisfactory.

If, however, there has been any trouble with intestinal parasites in the old flock or absolutely clean range, meaning that range other than what the old flock has used is not available, one should keep the chicks confined to the house or else in a covered yard with a fill of clean sand, gravel, cinders, or a cement feeding floor. Enough is known at the present time about nutrition, especially in respect to chicks, to properly fortify a ration that will promote growth under these conditions.

Don't take a chance on anything except a new, clean range. It is necessary to keep the flock confined until it is possible to move the house out to new fields. This may be for a period of only 6 to 8 weeks or longer, depending upon how long heat is required and how much labor is entailed.

Worm infested chicks or pullets with chronic coccidiosis cannot make good producers. Build a foundation during the brooding season that will carry the heavy production demanded next winter.—J. B. HAYES.

A question of national interest has recently arisen and we think it proper to pass comment.

"Does an incubator chicken love its mother?"

Value of Various Protein Supplements for Egg Production

The Missouri Station reports experiment with laying hens various protein concentrates, with minerals and some without t

The following protein concentr were fed to White Leghorn hens had passed through at least one ing season: cottonseed meal, soy meal, tankage, meat scrap, fish and dried buttermilk. The cotto and soy bean meal mashes were pared to similar mixtures conta a mineral mixture. The mineral plement consisted of 4 pounds s bone meal and 1 pound salt; o shell and soft limestone rock available to all pens. The basal consisted of equal parts of shorts and cornmeal. The remai of the ration was a mixture pounds of corn and 1 of oats, monly called scratch feed. The companying table shows the re from November 1, 1923, to Oct 31, 1924.

Pen No. and ration	Grain per hen per year	Mash per hen per year	Ave. egg pro-duc-tion
	Lbs.	Lbs.	
1. Cottonseed meal 30%	50	21	67.4
2. Cottonseed meal 30%; mineral mixture 4%	55	15	116.9
3. Soy bean meal 30%	55	17	69.9
4. Soy bean meal 30%; mineral mixture 4%	50	21	121.0
5. Tankage 20%	54	20	109.0
6. Meat scrap 20%	56	20	107.0
7. Fish meal 20%	53	20	110.6
8. Dried buttermilk 30%	56	24	128.5

Of special significance is the e of the addition of the steamed meal and salt to the cottonseed soy bean meals in reducing amount of feed per pound of egg compared with these same su ments without the mineral subst es. It will also be noted that greatest average egg production in the pen receiving dried butter and that the feed per pound of was next to the lowest of any of groups.

Did You Ever Give a Thought To This?

That hard times mean nothin a hen? She keeps on digging wo and laying eggs, regardless of v the newspapers say about conditi If the ground is hard, she scrat harder. If it is dry, she digs dee If she strikes a rock, she w around it.

But always she digs up worms turns them into hard-shelled pr as well as tender broilers.

We Have Consigned Our Best To the U. S. National Blue Ribbon Sale Oconomowoc, Wis., April 26

Want to own the greatest producing junior four-year-old cow in the state of Wisconsin? **YOU CAN.** Want to own a cow who has just made 32 lbs. in 7 days—a cow that 100 breeders have admired and tried to buy before she had this record. **YOU CAN OWN HER TOO.**

Want to buy a son of North Star Joe Homestead from one of Carnation's greatest foundation cows—a 1,000-lb. cow with a 3.8% test? **YOU CAN OWN THIS BULL.**

Want to own a 3-year-old show heifer out of a 34-lb. 1,000-lb. daughter of Avon? **YOU CAN.**

We let Bob Haeger walk through our herd and pick any four he wanted, and he selected:

1. **AVON ECHO DAISY**—a daughter of Avon Pontiac Echo who has just completed a year record of 28,664.4 lbs. of milk and 1,125 lbs. of butter—the greatest milk record ever made by an animal her age in Wisconsin. Due May 3, 1927 to North Star Joe Homestead.
2. **COREY WOODCREST ORMSBY**—a real show cow with a splendid udder and as good a hide as a cow could have. She has just made 32 lbs. in 7 days, is milking 90 lbs. a day testing over 4%.
3. **BURTON ECHO VIOLA**—the sweetest daughter of Burton you have seen yet, out of a 34-lb. 1,000-lb. daughter of Avon Pontiac Echo.
4. **CARNATION JOE KORNDYKE FOBES**—born May 18, 1926, one of the most desirable sons of our great All American show bull, North Star Joe Homestead. We consider his dam one of the best foundation cows of the Carnation herd, a 1,000-lb. cow with a 3.8% butterfat test for the year. This is a rare bull. It will make someone a great herd sire.

The Above Animals Represent The Best That We Have Been Able To Produce And We Recommend Them To Men Who Want Something Exceptionally Good.

ABORNO

Non-Scour Remedy

Prevents and relieves White Scours in Nature's way, by supplying the elements which the young animal needs to keep its digestive tract working properly so that infection will be successfully resisted and harmful bacterial action neutralized.

ABORNO NON-SCOUR is a simple, wholesome aid to Nature which acts promptly and effectively preventing scours from attacking well animals and overcoming their harmful effects upon ailing ones. To prevent serious losses it should be given all young calves, pigs and lambs up to the ages of 6 weeks.

Easily administered; two or three tablets, dissolved in water used as a drench. Put up in gelatine coated cases, each containing 12 tablets, sent prepaid for $1 per case. If not satisfied with results, price will be refunded.

One calf, lamb or pig saved by using ABORNO-NON-SCOUR will pay for treating a good sized herd. Our guarantee protects you, so send for a case today.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Cottonseed Meal Poisoning

There seems to be a widespread prejudice against cottonseed meal as a feed for dairy cows and it possibly is based upon the established fact that this feeding material does contain a poisonous element and will certainly kill hogs when freely fed to them for an extended period. We have even heard it emphatically asserted that the feeding of cottonseed meal to dairy cows is a cause of abortion; but we have no practical evidence that such is the case, unless the feed be made the almost entire ration of the pregnant animal. It is a feed that must be judiciously allowed else ill effects will certainly result. It is a most valuable feed when properly used as a part of the ration along with plenty of silage, good roughage, and mixed ground grains, wheat bran, and linseed meal. Even horses and sheep may take some of it with impunity, but it is unsuitable for them in large amounts. In the southern states cottonseed meal and hulls often form the chief part of the concentrate ration for cattle and we have had no reports of abortion certainly being caused by it, unless the pregnant cows were actually poisoned by it, and that is rare.

Cottonseed meal, in judicious quantities, supplies much needed protein and helps to firm up butter which tends to be softened by too much linseed meal. We have found it a good preventive of undue looseness of the bowels when cows are turned on grass in spring; yet it will cause excessive looseness when excessively fed. Cattle seem to take up to 3 lbs. per day with impunity, provided they also receive silage or roots, ground grains and wheat bran, together with good roughage. It is least likely to cause ill effects when cattle are grazing green grass. Hogs are killed by it when heavily fed thereon for a period of 100 days and cattle so fed for that length of time tend to become sick, lame, and even paralyzed. In them, a sure symptom of cottonseed poisoning is formation of a blood-red ring around the pupil of the eye. Even when made but one-third of the concentrate ration for swine, it proves poisonous after an extended period of feeding. The poisonous element has been determined as a yellow compound called gossypol.

Considering the known poisonous properties of cottonseed meal, we wonder whether it might not be well to omit the feed from the ration of dairy cows that are known to react to the blood test for contagious abortion disease. It may well be done without, as the ration can otherwise be balanced, and it is barely possible that omission of the feed might lessen the likelihood of abortion. Now that the effect of complete and incomplete rations for pregnant cows, and heifers while developing to a breeding age, is being determined by elaborate experiments at the Wisconsin Experiment Station and the effect of minerals in the ration is also being decided, it might be well to consider the possibility of certain feeds having an irritating effect and intensifying the tendency to abortion in affected or susceptible cows. We merely offer that as a suggestion and would also advise readers, experimentally, to omit cottonseed meal and hulls from the ration of pregnant cows, if the abortion disease has been prevalent in the herd.

Anthrax

Last summer I lost all of the calves I started to raise but one. The veterinarian told me the trouble was anthrax and advised me to vaccinate them this year. Where can I get the medicine to do it with and how am I to do it? I know of some men that do their own vaccinating.

West Valley, N. Y. O. H. F.

As anthrax is a dangerous contagious disease and is communicable and fatal to man, an outbreak has to be handled by the state veterinarian or his deputy, along with the attending veterinarian. Vaccination has also to be done by a qualified veterinarian. It cannot be correctly or safely done by the owner, nor do we know of any firm handling biologics that would supply the layman with anthrax vaccine. However, western ranchmen sometimes do their own vaccinating against blackleg where a veterinarian is not available, but scarcely against anthrax. Apply to the U. S. Department of Agriculture, Washington, D. C., for a bulletin regarding anthrax and its control.

Barren Heifer

I have a 2½-year-old registered Jersey heifer that never came in heat to my knowledge. Can anything be done for her to correct the cause?

Delavan, Ill. F. E. S.

If the heifer was twinned with a bull she was a "free martin" and congenitally sterile. Otherwise she possibly may come in heat if you have her ovaries massaged by a veterinarian. Meanwhile douche the vagina two or three times a week with blood-warm (100 degrees F.), boiled water tinged light pink with potassium permanganate.

Sore Teats

We have a new barn on this place which we are using for the first time this winter. It has cement floors all over. We have had considerable trouble with sore teats. They get sore on the ends (sometimes are sort of torn and bleed.) I have laid this to their stepping on their own teats. The teats will, in a day or two after this, get very hard to milk.

Have you heard of any other cases like this? One of our neighbors has had some trouble. We never had this trouble before, but never had concrete floors in the cow stable before. I use all the straw under the cows that I can but this works out of course. Would plank on the concrete help matters any?

Jonesboro, Ind. C. D.

Concrete floors are a common cause of mysterious subacute mastitis or garget. Cover the rear part of each stall with a mat or grating of wood which must then be kept clean. Cork brick makes a good cow stall floor, but cannot well be put in now. Cows with large teats and pendulous

Lump Jaw

e have lump jaw in our herd and we ld like to know how to rid the herd of it. at causes lump jaw and what is the best to prevent it?
kyberg, Minn. J. J.

Lump jaw is caused by the "ray gus" (actinomyces) which is carrd into the soft tissues of the uth or the skin of the face, jaw, ., by the beards of barley or other ins or grass, or by sharp parts of age. The disease is not directly tagious, nor is it hereditary. Afted cattle should, however, be t isolated as pus from their disrging sores may contaminate feed l, in time, tend to infect cattle. hen not far advanced and when bones are not badly involved, the dease is curable by operation and ternal administration of potassium ide. A veterinarian should be emyed to dissect out the diseased ss or slough it out with caustics. e average dose of potassium iodide drams a day, given in water until eyes and nose start discharging. en this treatment should be distinued, but resumed later if needApply to the U. S. Department Agriculture, Washington, D. C., a bulletin on the disease.

White Scours

had a great deal of trouble with my g calves having scours, last year, and it is starting this year as my cows hen. They seem to get it when they are 4 days to a week old. Their bowel ement seems to be a light cream color and a strong, peculiar odor. I cleaned up ything in the calf pen last spring and yed it with strong sheep dip, but it s to have come back again.
inona, Minn. E. L.

he calves are affected with the m-caused form of dysentery popurly termed "white scours" or "calf lera." There is no certain mednal remedy but the disease may fly well be prevented by the foling procedure: Provide a new sitary calving pen and similar calf p. At birth saturate the stump of calf's navel with a two per cent stion of mercurochrome or with ture of iodine and then dust with dered starch. Repeat the treatnt daily until the cord has entirely ed. Do not let the calf nurse its n but feed it the milk of a cow t has been giving milk for some tie. If constipation troubles, give tor oil in milk. As soon after h as possible also have each calf immunized with a biologic antagonisti to the disease. Consult your veterinarian about that treatment.

Milk Fever

there any known way to prevent milk er? Is a cow apt to have it when freshng after she once had it? I have been to so and also to shut them up for 10 days two weeks and not feed very heavy before ing.
ise, Idaho. E. E. T.

One attack of milk fever makes a cow subject to another attack when she calves. To prevent the attack dry off the milk secretion at least 6 weeks before calving and reduce rich feed. Keep the bowels active, enforce daily outdoor exercise, and let the calf nurse for a week, from birth. It is also well to give a susceptible cow 5 grains of potassium iodide daily in her drinking water during the non-milking period before calving. Keep the stable well ventilated and cool.

How Europe Farms

(Continued from page 370)

they have reached the proper size for market. They grow fast under their intensive pen feeding.

The Boers are well-to-do people and thrifty people. They do not own a motor car, but nearly every member of the family has a bicycle, the almost universal mode of transport in Holland. Mrs. Boer was not at home the day of my visit, which I regretted, as I suspect she is a very important personage in the partnership. Besides being an expert cheesemaker, she is an expert housewife. The large house is a model of neatness. In the wintertime the cattle are kept in the house. Now, in the summertime, these quarters are scrupulously clean and are used as storage space for cheese. There is good furniture in the house; and there are good pictures, too. Also, there are electric lights throughout the farm buildings.

After a tour about the farm Mr. Boer invited us to the sitting room where we were served tea and cigars. Tea is bad enough, but in Holland it is worse. The cigars, however, made up for the tea. Cigars in Holland are uniformly good and always inexpensive.

I was anxious to get some figures on the business side of this farm. The value of the real estate is just about $45,000. The value of the live stock and other equipment is about $15,000. This means a total value of $60,000 for the business. Please remember that this farm is of about average size and average value for this region. In the year 1924, which was rather more profitable than the average year for this farm, there was a farm income of $3,600. This figure represents the difference between the total income and expenses. This does not sound so bad—but wait. Interest at 5 per cent on a $60,000 investment is $3,000. In other words, if Mr. Boer charged himself with this item, he would have but $600 left which would represent the earnings of himself and his wife for the entire year. An American business farmer would say that the value of the inventory was too high for this kind of a farm. Let us look at this matter from a different angle. The rental value of this farm is nearly $30 an acre for the land and buildings. This may seem very high for dairy farming, but when you consider the land worth $650 an acre you may readily see that the percentage returns of the landlord is only about 4½ per cent; and after he has paid taxes and provided for repairs and upkeep, the investment may net him from 2½ to 3 per cent.

Why is it, then, that the land owner is satisfied with so low a return; which is another way of asking why land is so high in value! The Dutch farmer knows no investment more safe, more stable, or more satisfying than land. He has with him the example of friends who have lost heavily in securities investment, especially in the bonds and currency of Germany. He is taking no more chances on "scraps of paper." Furthermore, the opinion was expressed to me by a Dutchman of broad experience that Holland, which contains about seven million people, has about one million more people than it needs for its best economic and social interests. This excess population means land values that are too high and wages that are too low. It will probably be many years before conditions in our own country will even approach those of Holland today.

Uncle Ab says a skillful workman doesn't like to wear gloves.

Keeping Cows in milking trim

YOUR cows may be of the best dairy type, you may be giving them good feed, the best of care—but unless you keep them in milking trim they will not give you maximum milk production.

Heavy milk production depends upon four all-important factors: Health, Appetite, Digestion and Elimination.

Regardless of the goodness of her feed, unless your cow's system is kept in a healthy, vigorous condition, every organ functioning properly, so that she can assimilate and get the good of her ration, she cannot give you the extra pounds of milk which add so materially to your profits and may mean the difference between debit and credit on her page in your dairy ledger.

Dr. Hess Improved Stock Tonic puts —and keeps—cows in milking trim

Dr. Hess Improved Stock Tonic is exactly what a cow needs to give her that measure of health which enables her to give the maximum returns for her feed—to keep her at the top of milk production.

It contains nux vomica, that finest of all nerve tonics, the dairyman's favorite remedy. Its bitter tonics give cows good appetite and good digestion. It contains diuretics to keep the kidneys active and laxatives to regulate the bowels—to give cows good elimination. Dr. Hess Improved Stock Tonic provides the correct proportion of those valuable minerals, calcium carbonate, calcium phosphate and potassium iodide, lacking in the feed, which are so necessary in reproduction, for body maintenance and for milk production.

Dr. Hess Improved Stock Tonic promotes the natural, healthy functioning of every organ of the cow's body and maintains the proper normal balance between what she takes into her system and what she gives out.

One cow owner's experience

After a recent verified test conducted among a high-grade dairy herd, in which cows given Dr. Hess Improved Stock Tonic showed an increase of more than nine gallons per month per cow over a like period of time with same feed and care when they were not given it, the dairyman said:

"I would continue to feed Dr. Hess Improved Stock Tonic, regardless of the gain, because my cows show a decided improvement in health, appetite, general condition, and I am assured that the continued use of it will avoid any milk slump and will keep my cows up to the top of milk production for the entire milking period."

Try it on this unconditional guarantee

Go to your dealer and get sufficient Dr. Hess Improved Stock Tonic to last your cows 30 days. Feed according to directions, give it a fair trial. At the end of 30 days, if you have not seen a satisfactory increase in the milk flow, better appetite and better condition of your cows; if there is any question in your mind as to whether the Tonic has paid you and paid you well, return the empty containers to your dealer. He will refund your money or cancel the charge. We reimburse him.

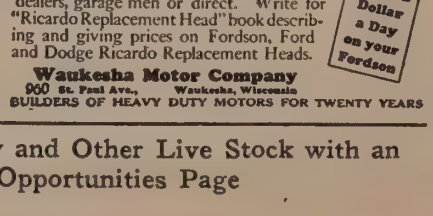
SEED CORN

Wing's Improved White Cap still holds Ohio State record for greatest yield. Other varieties also. Highest quality Field Seeds. Moderate prices. Write Chas. E. Wing Seed Co., Dept. 321, Mechanicsburg, Ohio



Crops exceed expectations

SUTTON'S Pedigree Mangels are the heaviest cropping mangels known and also possess the highest percentage of dry matter. They have been bred for over 70 years for heavy production and practically every seed germinates. Hundreds of farmers and cattle breeders feed Sutton's Pedigree Mangels daily and are getting amazing results as well as saving money.

A dairy farmer of Johnstown, Pa., writes: "We planted the Long Reds and got an outstanding crop of 15 tons to a half acre. The crop so exceeded our expectations that we carefully weighed the product and measured the ground."

You can do as well. Write for illustrated catalog containing full cultural directions and valuable data on cattle feeding. Address

The L. P. Bailey Company

(Continued from page 371)

convenient for the grandchildren to become active in the affairs of the company both as to labor and finance, no one is urged beyond reason to do so.

A modern clay block building houses the equipment for manufacturing butter and pork products, these being the chief products sold. The cream for making the butter is all produced on the farm from a herd of 60 pure-bred Jersey cows. Nearly all the hogs for the pork products are purchased, preference being given exclusively to Hampshires. The leader in the pork products is "Bailey's Pure Pork Sausage" put up in cartons of convenient weight for direct consumer trade. Scrapple is also a specialty and this is likewise marketed in cartons. Besides these are hams and bacon cured country style. Much cottage cheese is made and marketed in pint cartons. Buttermilk is also delivered fresh to consumers. Eggs from the farm flock are marketed as "Bailey's Best" in carton containers. Some dressed poultry is sold and when it leaves the farm it is ready for the housewife to put directly into the cooking utensil to be used. Fresh vegetables in season go along with the trucks to Wheeling, West Virginia, where the products are marketed.

The dairy barn housing 50 cows is a model in lighting and cleanliness. It is unique in labor saving equipment. Of particular interest is the way in which the manure is removed from behind the cows and later from the barn. Instead of the ordinary gutter for receiving the manure a wider and deeper trench was made and this covered with heavy iron bar grating which is on a level with the barn floor. No bedding is used and the manure goes through the grating into the trench. These trenches, one behind each row of cows, run to the end of the barn where the manure is scraped out into a spreader by electric power and mechanical device. These trenches are not scraped out every day but only as the accumulations fill them. Thus the manure is not touched with fork or shovel from the time it is produced until it is spread on the field. With the manure taken care of in this manner, with the feeding being done from carriers, and with a milking machine, 2 men feed and milk 50 cows in about 1¼ hours and do it easily and as goo it can possibly be done.

All of the concentrates for cows are stored and mixed overl and the mixture is delivered to feed carrier down a spout by gra None of the silage is carried by to any of the cows whether they in the old barn or in the new o

The milk from each cow is wei and recorded for each milking. herd is in a cow testing associa No feed is wasted on low produ Some official testing is also don

In the factory where butter meat products are made, mo equipment is used. This includ refrigerating plant. Thus labo used efficiently and the quality of products effectively controlled.

From this little farm factor truck makes trips 4 times a wee Wheeling. The day we were t the load included the following p ucts: butter, cottage cheese, bu milk, bacon, hams, fresh eggs, t toes, sweet corn, and apples. In winter season sausage and scra take the place of the vegetables.

Mr. Bailey served 5 years member of the Ohio State Boar Agriculture and was president of body one year. After he was years old he spent 3 months winter for 6 years doing agricult extension work for Ohio State versity.

The hand of death has enter Bailey home but twice in 56 y the wives of two sons having been nied the priceless privilege of rem ing longer in their homes. Of direct descendants of Mr. and Bailey, including six children, grandchildren, and 3 great grand dren, none has died. This is a markable achievement.

Good fortune smiled on Belm County when this native Quaker ple chose to stay in the county w they were born and reared. We l told something of the material p gold dug out by them and someti about the splendid family reared, there is something more to tell. is best told in the language of who is a citizen of that county in answering the question, "How n is L. P. Bailey worth?" said: "I d know how much he is worth but know he has been worth a million lars to Belmont County." What gr er tribute could one give a fe countryman?

A Severe Winter on Clover Seedings

(Continued from page 370)

previously described, as it will not be necessary to carry on so much cultivation.

Where beans are broadcasted, the weeds must be kept down, otherwise the beans will not grow more than half their ordinary height and the hay would be filled with all kinds of weed growth. This can be readily done by using fine tooth harrow on the soy bean field. Beans should be dragged in the afternoon of a warm day and the drag should be run crosswise of the way the beans were planted. This is the best method of killing weeds and if this practice is continued three or four times, the field will be practically clean of weeds and one will have a nice level field of soy beans that should give him from two to three tons of good soy bean hay per acre.

If our dairy farmers have not as yet tried soy beans and do not find a good stand of clover this spr better give the soy beans a trial. T surely will never regret it.

Hay Rope Cart

HOARD'S DAIRYMAN:—A team always hitched to a two-wheeled and the hay rope hooked on this stead of fastening the double-tre the rope by a clevis on the W Meinke farm in Clinton Cou Iowa. This put the pull down lo and the driver rode the cart.

The cart was made out of wheels of an old corn planter mo ed on an axle. The axle was bo to a heavy cross-piece and a ton fastened to this and braced. A m er seat was bolted on this truck. ring in the end of the hay slipped over a large hook in the dle of the cart crosspiece.

The ring was slipped over this h and the hay pulled up and into barn. Then the ring was lifted of the hook and the team turned aro and driven in place for the next and the ring hooked on again.

Iowa. A. M. WETTAC

centralization of Industry Would Help Agriculture

(Continued from page 368)

ater part of the year (and, there- o, poorer than it should be) or else t ust be broken up. But, if indus- r l decentralization takes place on lide scale, countless farmers' fam- li will have the choice of a variety f occupations and will be able to e ize the full measure of their earn- n capacity without disrupting home i

inging Electricity to the Farm

Furthermore, decentralization of n stry will help the farmer in an- t r and quite different way.

Electric superpower systems are l to industrial decentralization. Whout these systems, industries v not spread out into the country, e rdless of advantages to be se- d by doing so, but will remain in c ested centers. But wherever erpower systems are well devel- l, power can be secured almost n where, and decentralization is n free to take place. Hence, as erpower systems grow, small fac- c es will multiply in the rural dis- r ts.

Now, the chief obstacle to the l trification of our farms is the high c of bringing electric service to n. It usually does not pay to tap a igh-tension line and build a low- s ion line to take care of the rela- i ly small demand of a few scat- e d farms, but it frequently does a to do these things to serve an in- l try; and, when once a service con- n ion is made and a line is built, n hboring farms can then be sup- p d with electric power at a reason- l cost. Hence, as small factories n tiply in the rural districts, more n more farms will be electrified.

No one questions the great value f lectric power to the farmer. Give h farmer electric power at a rea- c ible cost, and he can immediately e eve himself and his family of a s e portion of their burden of labor, n ace his costs, make his profits n e certain, and, what is of equal n ortance, raise his standard of liv- n to a level corresponding to that f the city dweller, which will im- p ve the morale of his family, help o keep his children at home, and n e it more easy for him to secure f ient labor when he needs it.

To sum up the decentralization f ndustry will enable the farmer to n aden the earning capacity of his s ily, increase the business value of i farm, and make his home more at- r tive. It appears, indeed, to be h most promising, if not the only p ctical, influence that will bring ag- i lture back into step with other A erican industries and restore p sperity to it. If this can be done, t will mean the elimination of dis- c ent and radicalism from a large i influential proportion of our pop- l ion, thereby greatly strengthen- n the political and economic struc- t e of the country."

A Federal Accredited Herd

REGISTERED GUERNSEY HERD
Offered At Private Sale !

Having decided to sell Oakwood Farms in small tracts, I am offering for sale my entire herd of Pure-bred Guernseys which was started in 1910 with three Foundation Cows purchased from W. W. Marsh of Waterloo, Iowa. My herd consists of 45 head of females and 10 males, mostly young, and in splendid condition.

My last two Herd Bulls were sons of Prince Cherub and Eminent of Sarnia. If interested in purchase of one or more Guernseys from a clean herd, it will pay you to write me for list with full description and prices.

The herd is accredited.

L. S. MEYER Route 8, Springfield, Missouri

MARSH FARM GUERNSEYS

Founded upon CHERUB blood, combining modern show type with production. At the last 13 National Dairy Expositions 46 out of 78 championships have been awarded to cattle from this farm. There are now in the herd 40 cows with yearly records of 500 pounds of fat in Class G. to 900 pounds of fat in Class A. In your efforts to improve the type of your cattle, the show ring records indicate Cherub blood as the really sure way. Let us advise you about your next sire.

MARSH FARM, WATERLOO, IOWA

BUY LADYSMITH CHERUB BLOOD

Shorewood Farm offers the bull, SHOREWOOD HERO, a double grandson of Ladysmith's Cherub whose 19 A. R. daughters average 600 lbs. fat. Dropped April, 1926, solid fawn, good individual. Sire—Cherub's Royal Leader of Shorewood (senior herd sire) whose dam, Pearl of Pomeroy, has 777 lbs. fat in AA., full sister to Pearl's Dot, 965 lbs. fat AA. Leader's first three daughters on test are doing exceptionally well. Dam—Cherub's Procris of Shorewood, undefeated 2-year-old and grand champion at 3 large shows, 1925. A. R. record 10,500 lbs. milk, 540 lbs. fat Class G. while on show circuit. Her dam, Ma Chere Procris, National grand champion 1921, A. R. record 17,900 lbs. milk, 831 lbs. fat, Class A. A wonderful combination of Ladysmith Cherub, May Rose and Jardinere Masher blood. Write for pedigree and price.

SHOREWOOD FARM, CRYSTAL BAY, MINNESOTA

Be Careful When You Buy A Sire!

Our blood lines are proving themselves in many parts of the U. S. They bring better udders, straighter backs and deeper bodies and production. Aside from these fundamental factors it is well to remember that **YOUR NEIGHBORS WILL BE INTERESTED IN YOUR BULL CALVES IF YOU ARE USING A SON OF THE HOARD'S DAIRYMAN FARM SIRES.**

Our Sires Are:

Anton's King Confidence 43517 A. R.
(Famous for production, good individuality and excellent udders.)
Sire: Anton's May King 27387 A. R.
Dam: Ma Chere Confidence 55851 A. R. 15,802 lbs. milk, 764 lbs. fat jr. 4-year-old. 10,190 lbs. milk, 511 lbs. fat, jr. 2-year-old.

Mixter Claimant 100143
(Born April 20, 1924. Production and individuality back of him. Big and plenty of scale. Real udders, good individuality and consistent production.)
Sire: Langwater Mixter 69371.
Dam: Yeoman's Mixter Fragrance 9421 A. R. 17,693 lbs. milk, 761 lbs. fat A.

Bonanza of K. P. 62518 A. R.
(Sire of big, milky heifers. Good top lines and square, well attached udders.)
Sire: Anton's King Cecil A. R.
Dam: Beauty of K. P. 48654 A. R. 12,401 lbs. milk, 622 lbs. fat, 3-year-old.

King Harvester of Prospect 102549
(Born March 3, 1924. A son of Bonanza and out of the best cow we ever owned or bred—a daughter of A. K. C.)
Sire: Bonanza of K. P. 62518 A. R.
Dam: Anton's Guernsey Girl of Prospect 13737 A. R. 9,978 lbs. milk, 471 lbs. fat in GG. Regular herd care and feed—milked twice a day.

We have young bull calves for sale. The oldest was born June 22, 1926. It will pay you to buy the sire you will need next winter right now.

TWENTY BULLS — The Pick of the BRANT RANCHO HERD, Owensmouth, Cal.

all from A. R. cows with records up to 889.5 lbs. fat. Many of them sired by sons or out of the daughters of great bull Brookmead's Whiteface.

Breeders of the middle west have for years been hoping to have an opportunity to buy bulls from Brant Rancho, but express rates have been prohibitive. Now you can buy these bulls right at home, and see them before you buy them.

Brant Rancho herd is Federal Accredited No. 96073 and is the largest herd in America. Most of the bulls are ready for service and are sold guaranteed breeders.

Inquiries that have come in the past few months indicate that many middle west breeders are looking for bulls to head pure-bred herds, and this is your chance.

The Entire Herd of Edgar P. Sawyer
Oshkosh, Wisconsin

This is Federal Accredited Herd No. 2923 and the lot consists of the **TWO HERD BULLS** and **29 VERY CHOICE FEMALES.**

The foundation cows have records as follows:

Pergue's Mabell Dorothy 576.41 A. A.
Pergue's Harmante 559.06 C.
Arline of Waldwic 538.78 G. G.
Pergue's Easter Lass 384.32 G.

These cows and their progeny sired by the great bulls, Admiration of Edgemoor A. R. whose dam, Donnington Goldie 5th, won first at National Dairy Show and had a record of 796.52 E., and Royal of Maple Hill out of Lady's Girl of Maple Hill 738.21 B.

This latter bull Mr. Sawyer paid $2,500 for in 1920 National Sale and he is in the sale.

FOURTEEN COWS and **ONE BRED HEIFER** all bred by and the **property of A. H. Hinman, Allenville, Wis.,** all the sound cows in his herd and a useful lot of cattle. The foundation of the herd was A. R. cows but no testing has been done recently. Herd free of disease and will be T. B. tested just before sale.

If you want to buy good Guernseys worth the money, send for catalog and attend sale

U. S. National Holstein Sale

PRILLY LYONS VASSAR MAY, 699485. The highest record Jr. 2-year-old for 1926. She produced 24,668.2 lbs. milk, 1,184 lbs. butter nd is out of an 1104-lb. 4-year-old dam. This outstanding young cow s a three-quarter sister to Max View Model Fayne, the 1215-lb. 2-year-old that sold at Clark's Classic for $3800.

WASTIKA VELVET DORA 1029769. A junior 2-year-old that has ust completed a 7-day record of 24.21 lbs. butter from 329.6 lbs. milk. Her dam produced 1115.95 lbs. butter from 27,212.5 lbs. milk as a Jr. 2-year-old and was in turn from a 918-lb. cow. Her sire, Velvet Segis Prospect, is a 1080-lb. grandson of Segis Pietertje Prospect, his two nearest dams averaging 34,000 lbs. milk, 1250 lbs. butter.

WASTIKA VELVET ONA KORNDYKE 1029770. Another Junior 2-year-old daughter of Velvet Segis Prospect that has 100% the same breeding as the heifer named above. She has just completed a 7-day record of 21.27 lbs. butter from 345.4 lbs. milk. These two junior 2-year-olds are unusually good individuals—the kind we like to have represent our herd at such a sale.

ELL FARM RUBY 971761. The first daughter of Carnation Farm's popular sire, Sir Romeo Mildred Colantha, to freshen. She has just ompleted a 7-day record of 22.12 lbs. butter from 356.2 lbs. milk.

his is, we think, an unusually good consignment, every member of hich is a foundation female good enough to please the most exacting uyer. We hope you will look for them April 25—29.

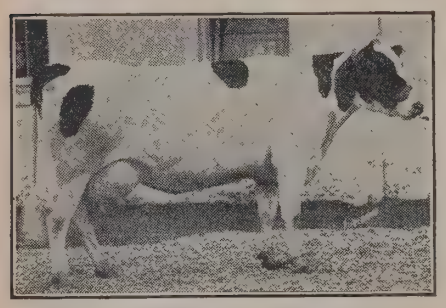
U.S. NATIONAL SPRING SALE

America's Best Holsteins

This is the Dairyman's Opportunity



To replace Grades and Common Milkers with the best Purebred Holsteins without sacrificing immediate milk supply. *A large number of the offerings are fresh or springing — carefully selected for production and type.*

WISCONSIN MERCEDES FOBES ORMSBY
A beautiful 34-lb. daughter of the famous sire, Sir P. O. M. 37th, out of a daughter of Wisconsin Fobes. With her will be sold her son by a great Ormsby sire.
Schrock & Culp, Waupaca, Wis.

PRILLY LYONS VASSAR MAY
The Michigan State Champion junior four-year-old with 1184.03 lbs. butter. Her dam also has 1100 lbs. Springing by Ambassador Fobes.
Detroit Creamery Farms, Mt. Clemens, Mich.

SEGIS SINDT FLORA BUTTER GIRL
A great 1197-lb. four-year-old, from an almost 1000-lb. daughter of a 1257-lb. cow. Due in July by Ormsby Sensation.
Lilliberk Farms, Homer, Mich.

ORMSBY SENSATION ABBEKERK
A 1000-lb. four-year-old and World's Champion junior two-year-old in the 305-day division. Daughter of Ormsby Sensation. Her 33-lb. 3-year-old daughter also consigned. Fresh.
Lilliberk Farms, Homer, Mich.

The man who must make his living from his dairy will find in this great five-day sale series just what he needs to improve his herd and increase his milk check. These offerings are the kind that will make good for the farmer under farm conditions and many of them are "ready"—will start immediately paying profit on their production. All from good clean herds—mostly Accredited Herds—and all sold with a Health Guaranty.

A Few Representative Bull Offerings

1. One of the greatest proven sons of Iowana Sir Ollie.
2. A young son of Dutchland Colantha the Great from an 1178-lb. 4-yr.-old daughter of the only 35,000-lb. cow in the East.
3. Famous Grand Champion bull from Pabst's 1925 show string.
4. A proven son of the greatest milk producer east of Rockies—35,339 lbs.—sired by one of the greatest sons of Sir P. O. M.
5. A son of the twice All-American bull, General Homestead Mercedes, from the Wis. Champion 305-day milk producer.
6. A son of Admiral Ormsby Fobes from an 1187-lb. 4-year-old and Wisconsin Champion milk producer.
7. 1100-lb. son of All-American bull, North Star Joe Homestead.
8. 1000-lb. son of Grand Champion, Count Veeman Segis Piebe.
9. A son of the 1281-lb. K. P. O. P. bull, Friend Piebe, from a 944-lb. 3-year-old dam.
10. A son of Colony Posch Newman from one of the 1000-lb. daughters of Finderne Pride Fayne.
11. A proven sire out of a twice 36-lb. daughter of Ormsby Korndyke Lad.
12. A proven sire, by a full brother to Pietertje Maid Ormsby and from a 1000-lb. daughter of "37th."
And a long list of others of the same calibre.

The Entire Lilliberk Herd

consisting of over 100 head, has been consigned to this sale series. This herd includes M. B. B. Beauty, Segis Sindt Flora Butter Girl, and Ormsby Sensation Abbekerk (see pictures), also the 34-lb. All-American cow, Belle Calamity Wayne, and many other 30-lb. and 1000-lb. cows. One of the greatest and most highly developed pure-bred Holstein herds in the country today. Accredited.

A Consignment of Bell Farm Breeding Includes

Bell Farm Honor and Bell Farm Ozone, two of the greatest bred bulls ever offered from this line of breeding. It includes Bell Farm Susie, Bell Farm Palmyra, and Bell Farm Cleopatra. These cows have perhaps the richest breeding, the greatest consistent production and combined with it the most pleasing type of any animals that have ever come forth from Bell Farm. In this consignment one can buy daughters of Bloomingdale Hengerveld Palmyra, "White Susie," Bell Farm Generous, Bell Farm Hattie, and other animals that have made Holstein history. The consignment is accredited and negative to the blood test for abortion.

Full information regarding the wonderful consignments in the sale may be had by addressing any of the managers.

Wonderful consignments from Carnation, Pabst, Zoberlin, Piek, Hollyhock, Walcowis, and about half a hundred other leading Wisconsin breeders; from Detroit Creamery, Jones, Lambert & Webber, and others from Michigan; Rieck and Osborne from Ohio; Brandenburgh, Johnson from Illinois; Dutchland Farms from Massachusetts; Lashbrook, Bruce and Carleton College of Minnesota. These and other remarkable offerings mark this as a sale of truly National scope and a sale that no breeder or dairyman in the country will want to miss.

Be on hand and get your share of these great offerings

HOLSTEINS

—Producers of Cash!

Holsteins stand supreme as butterfat producers. Holsteins in most instances are leaders in cow testing associations, both in individual and herd records. Under official test the important records for butterfat are all held by Holsteins. Their ability to produce butterfat, milk and calves economically, make them consistent producers of cash.

Wonderful New Method

Milks Cows as No Other Machine Has Ever Milked Cows Before !

The great Surge Milker, with its wonderful NEW Surging—Tugging Action, has taken the whole country by storm. Farmers everywhere are fast replacing their old machines with this new wonder milker. Its marvelous NEW Surging—Tugging—Action gives the cow's teat the real TUG of the calf—and, like the calf, TUGS harder and harder as the cow milks out. Cows LIKE this new Surging—Tugging Action. They contentedly give down MORE milk. For example, J. M. Eiskin of Sedalia, Missouri, writes us: "Within a week after I had installed The Surge, my herd of 20 cows showed a daily increase in milk flow of 5 gallons."

Whether you have a milking machine or not you owe it to yourself to mail the coupon below right now and learn what the wonderful Surge Milker will do for YOU.

Surge Milker

For the first time in the history of machine milking The Surge gives you this wonderful NEW advantage: Easy, Instant, Adjustability to milk each and every cow differently—just as each one should be milked. As you go along the line, with The Surge—*and this holds true ONLY with The Surge Milker*—you quickly and instantly adjust it to give each cow just the Suck and Tug each one needs. Think what that means! This one feature, alone, has induced many critical pure bred breeders to replace their other machine with The Surge. Certified Farms endorse The Surge because it is the ONLY milker with No Long Tubes and No Claws—is EASIER to clean—and really does produce clean, low count, premium priced milk every day—EASILY.

Send the coupon below now for details of our amazing FREE Demonstration Offer that enables you to prove all this yourself before you obligate yourself in any way. We want you to see and know what The Surge will do for you—at our expense—and then we are perfectly willing to abide by YOUR decision. Farmers also find our EASY TERMS a great convenience. Mail the coupon and get all this good news now.

Mail Coupon Now

Pine Tree Milking Machine Co., Dept. 28-54
2843 West 19th Street, Chicago, Illinois

Please send me without cost or obligation your FREE Surge Book telling all about The Surge Milker and also tell me about your special FREE Demonstration and "Easy Terms" Offer.

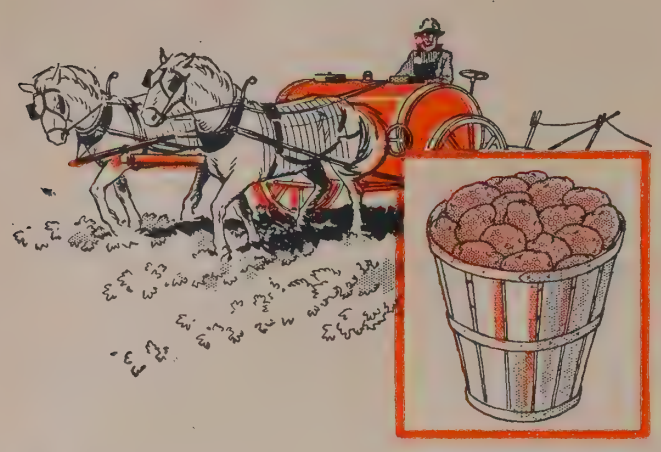
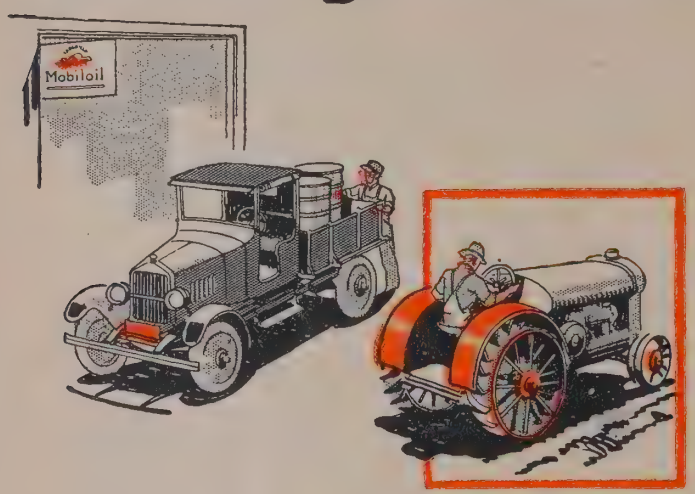
...TURAL
...RARY



HOARD'S DAIRYMAN

A JOURNAL DEVOTED TO DAIRY FARMING

...olume 72, No. 8 Fort Atkinson, Wisconsin April 25, 1927



What experiment stations report on potato spraying

In 323 tests during the past nine years, a Pennsylvania experiment station has compared the yield of sprayed and unsprayed potatoes. The sprayed vines have produced an average of 67 bushels of potatoes more per acre than those not sprayed.

In North Carolina 10-year tests show an average increase from spraying of 53.3 bushels per acre. Ohio demonstrations during the past 3 years have averaged an increase of 70 bushels per acre for the sprayed vines.

Mobiloil gives this same marked economy

Buying low-priced oil is like trying to save money by not spraying potatoes. To be sure, you pay a few cents extra for Gargoyle Mobiloil. But you get an engineering margin of safety in lubrication which is worth many dollars in a year's running.

In tractors, Mobiloil users frequently report that Mobiloil lasts twice as long as ordinary oil. And the costly delays from overheating and breakdowns are materially cut. In cars and trucks Mobiloil's economy is equally striking.

If you think any oil will do, consider this fact:

THE correct grades of Gargoyle Mobiloil for engine lubrication of prominent passenger cars are specified below.

The grades of Gargoyle Mobiloil, indicated below, are Mobiloil "E," Mobiloil Arctic ("Arc"), Mobiloil "A," Mobiloil "BB," and Mobiloil "B."

Follow winter recommendations when temperatures from 32° F (freezing) to 0° F (zero) prevail. Below zero use Gargoyle Mobiloil Arctic (except Ford Cars, use Gargoyle Mobiloil "E").

If your car is not listed below see any Mobiloil dealer for the complete Chart. It recommends the correct grades for all cars, trucks and tractors.

GARGOYLE

Mobiloil

Make the chart your guide

50% of all engine troubles are directly caused by faulty lubrication. The oil you pour into the crankcase today determines the size of tomorrow's repair bills. The added margin of safety in Mobiloil is important, both in postponing expense and increasing the usefulness of your engines.

When necessary, many farmers find that Mobiloil is well worth a special trip to town. Let the nearby dealer supply you with a season's supply of Mobiloil, now. In barrel and half-barrel lots Mobiloil can be purchased at a substantial saving.

Be sure to secure the right grade of Mobiloil to use in your tractor, truck and car. For Mobiloil is recommended with scientific accuracy for all engines. The 42 Mobiloil engineers have painstakingly studied each make and model of engine that you drive. The recommendations are in the complete Chart at all dealers.

Start using Mobiloil today. Before the year is out you will find that the extra margin of safety in Mobiloil has substantially reduced the cost of operation of your car, truck or tractor.

The Milk Cows at New Salem, North Dakota

OARD'S DAIRYMAN:—If old King had kept a record of his family and each Egyptian ruler from day to this had done likewise, Pharaohs would have less data mulated than the New Salem eding Circuit. The New Salem ners have worked together for enteen years, while King Tut ed a lone hand.

King Tut lived some 3,500 years . New Salem has nearly 4,000 r cow records.

he Honorable James Wilson, late retary of Agriculture, says that predecessor in the position of di- or of the Iowa Experiment Sta- carried on a trial in feeding es. He had but two calves on the l. At the close of the experiment said: "The wrong calf came out ad in spite of the devil."

King Tut with his single cow ld not have had much data but h one cow for 3,500 years the raohs could have given weighty dence.

The 823 cows milked at New Sa- during the first four years, (1910 1913 inclusive) averaged 56.2 lbs. butterfat than 1,022 milked by circuit 16 years later (1922 to 25 inclusive.)

The average for the first four rs was 190.1 lbs. butterfat per d and for the last four years 3.3 lbs. per cow—a difference of 6 per cent.

The average 1925 monthly price eived for butterfat in New Salem s 42⅝ cents per pound. The 14,- 3.1 lbs. of extra butterfat which cuit cows brought above that ich they had given 16 years before uld have brought that year 270.14.

That neat little sum paid a number bills and is as near "a letter from ne" as a grown-up often meets hin this world.

That premium is for working to- her, keeping the best proved sires, d hiring a superintendent to test herds and study the records.

Records of 43 daughters of the e King Wa Wa Segis Pontiac, an -year-old Holstein herd bull on the w Salem circuit, compared with t of their 43 dams gives interest- results. The dams are high class re-bred cows and the 43 head have average fat record of 373.2 lbs. their best calendar year. Their daughters have an average calen- r year record of 401.1 lbs.

Had grade cows or pure-bred cows low record been used in this com- rison the improvement shown by e sire would have been much eater.

It is not an easy matter to raise e daughters of 370-lb. cows up to 0 lbs. as has been done in this case. would be reasonable to guess that is sire could have raised daughters 250-lb. cows of poor breeding to 0-lb. performers.

King Wa Wa left 126 daughters d granddaughters which the Cir- it has a record of and there are ubtless many times this number in e hands of those to whom his sons ve been sold.

North Dakota. J. H. SHEPPERD.

How I Feed Calves

HOARD'S DAIRYMAN:—I'm so glad have a chance to unburden my ind as to feeding calves. For many ars my heart has gone out in sym- thy to the thousands of helpless lves who have had their noses unged into a pail of milk while a rong man stood astride the flabby tle body and held the head into the ail. It was a case of drink or drown, ith insufficient breath to do either. This savage system is not necessary.

We have Jerseys. They may or may not be easier to teach than other breeds; I do not know, but this is how I teach them:

We always tie our calves up as soon as they are dropped. They will do a lot of floundering around and will have to be watched a little at first so they do not get into dangerous positions, but they soon give up and agree to be tied. This helps a lot in teaching them to drink. You do not have to hold them. Wait with the feeding until they are hungry—from three to twelve hours. Take a shallow dish for the milk, which must be of the right temperature, neither too cold nor too warm. I use an aluminum mixing bowl that holds six pounds. This has many advantages over anything else we have ever used. It is light to handle and when feeding four pounds, it is not too full. Sloping as it does, the milk remains deep enough all the time so the calf can get almost every drop before it finds the bottom.

Now begins the feeding. Put the dish of milk up to his nose and dab his nose into it. He will move away. Move your milk to where he is and dab his nose again. This may have to be repeated a number of times before he gets any into his mouth. But as soon as he gets a taste he will be interested, although he does not yet know where the "goody" came from. Put the dish up again and nine times out of ten he will begin to drink after having had one taste. He may only take a swallow or two before lifting his head. Slowly put the dish back. He may want to suck the edge; move it away and try again. With a little patience, if he is hungry, you will have him drinking all alone in five minutes, never having to give him your fingers. There will have been no struggle, no strangling, no bunting, slobbering, or choking. If he is not hungry, leave him a little longer.

Understand, I have been talking about normal calves. Weak calves sometimes have to be babied more; but the shallow dish, milk of the right temperature, and a tied calf with an appetite are sure passports to success in teaching calves to drink.

(MRS.) AUG. PETERSON.

Wisconsin.

Soft heads do more harm than hard hearts.

Try an' burn it!

The most inexpensive of all fire-proof shingles

NO costly material on the millionaire's roof is more fireproof or more everlasting than Johns-Manville No. 70 Rigid Asbestos Shingles. Yet these shingles cost but little more than temporary combustible roofing materials.

The unusual hexagonal shape is the secret both of their low cost and their interesting beauty on your roof. It wastes no material in unnecessary overlapping. So we can make them of permanent everlasting asbestos and still sell them at a low price.

Lay them right over your old roof when reroofing

These beautiful shingles can never wear out, warp, curl, or change color. Think of the money that saves in repairs and replacement. They are fireproof. They are permanent.

See these remarkable shingles, see how they withstand the blow torch, how everlasting and beautiful they are—and how low in cost. Get in touch at once with your nearest Johns-Manville dealer.

The blow torch quickly shows the difference between Johns-Manville "fire-proof" Asbestos Shingles and the merely "fire-safe" variety. Before you choose a shingle, "Try an' burn it!"

BETTER METHODS OF HERD IMPROVEMENT

C. T. CONKLIN, Secretary Ayrshire Breeders' Association

OU can't tell the depth of the ocean by the height of the waves," mused a coast-wise losopher, and he might have added t you can't tell a thing about the duction of a herd of cows by dying a few of the highest records. a matter of fact, the waves may the highest over the most danger- reef, and similarly a few high ords may be rolling over a hidden al of low production with the ainder of the herd. And for this y reason the Ayrshire Herd Test ne into existence.

he first year's experience with the d test indicates that it has a secure e in the program for the advance- nt of the Ayrshire. Nearly fifteen dred of the breed's best cows are monthly subjected to this in- igation, and some fifty different ers promptly advised as to pro- tion, feed costs, and gross income every cow in their respective ls. It is interesting to note that ough there has been a serious ine in Advanced Registry testing, is the greatest number of Ayr- es that has ever been on test at time. Furthermore, there is ev- indication that it is simply the nning of an increasing number erds that will avail themselves of service.

Testing Plans Studied

he inception of the herd test s back some four years to a gath- g of a group of men who were in- ely interested in the progress of favorite breed. The question was nently raised as to why every Ayr- cow in the herds of the breeders were testing should not be tested. emed to these far-seeing cattle- that the truth should be known t the low produc- as well as the high ucers of the breed. he idea challenged ttention of the of- s of the Ayrshire ders' Association, as a result in 1924 nmittee, consisting Major A. Henry inson, Dr. E. S. ler, and Leonard s, was appointed. committee was in- ted to study the ms of testing in e in various suc- ul dairy countries to offer sugges- for a test that l involve every n the herd, and at ame time furnish ls that might be nized by the Ayr- Breeders' Associ- and given a place he pedigrees of cattle.

investigation followed im- pressed the newly appointed Herd Test Committee with the radical difference between the objective of the American breeder doing Advanced Registry testing and the successful dairyman of other lands. One group was testing to detect the unprofitable cow and thus raise the averages of their herds, while the other group was devoted to a policy of making the largest possible records with a small number of their best cows. Seldom was a mature cow started on the Advanced Registry unless there was reasonable assurance that she would make a satisfactory showing.

Furthermore, these dairymen across the sea believed that every cow must be tested not only for one lactation period, but year after year with clock-like precision. The Herd Test Committee also found that there was no holding back of breeding so as to get high yearly records with fewer calves. There were no box stalls nor highly specialized feeding methods to keep the laggard cow in the race.

Perhaps still more important was the finding that the expenses of testing were greatly reduced in other countries by the organization of local associations, and the very general participation of all breeders in testing work. At the same time this committee found that the idea of organizing local associations for testing entire herds was sweeping through the leading dairy states of this country in spite of the fact that the Advanced Registry system was losing in popularity. With a feeble beginning of one lone cow testing association in 1906, there were 700 functioning in 1924. These associations were testing more pure-breds than all of the systems that were recognized by the various breed associations, which was rather conclusive evidence that the American dairyman would continue to test his cattle if an economic and practical plan were presented to him.

This herd, consisting of two mature cows and ten first calf heifers, averaged 8,700 pounds 4.2 per cent milk, 365.1 pounds butterfat, with a 100 per cent calf crop.
OWNED BY NESHAMINY FARM, PENNSYLVANIA

These 101 pure-bred cows of all ages averaged 8,334 pounds 4.13 per cent milk, 344.2 pounds butterfat. Their average lactation period is 313 days with almost perfect calving record; milked twice daily.
OWNED BY PENSHURST FARM, PENNSYLVANIA

Requirements for Herd Testing

With the experiences of the dairy leaders of several countries from which to draw, plans were outlined for a system of testing that would involve every Ayrshire cow in each herd entered. There could be no sorting out of poor producers, shy-breeders, and cows with unsound udders so as to raise the herd average and delude the breeder regarding his profits. The test automatically includes every heifer as she freshens with her first calf. All reports are based on herd averages although the records of individual cows will be maintained and published. The calendar year was selected as the basis of computation, rather than the lactation period, so that the dry months are figured in the annual report.

In order to make the Herd Test applicable to the conditions of the general farmer and the dairyman, it was specified that mature cows should not be milked more than twice daily unless there was a production of at least 40 pounds of milk, with proportionate yields for immature females. To give the monthly reports from the Ayrshire Breeders' Association to the various owners the economic value that they warranted, feed consumption and costs were incorporated and charged against the production of each cow.

Economy of administration was secured by permitting the supervisor to test up to twenty cows each day. Furthermore, supervision was based on a one-day test with no preliminary milking, rather than the customary two-day test. Although the change to the one-day test seemed rather revolutionary, and there were many who considered it of little value, there has recently been published considerable evidence to support the theory that the one-day test is quite accurate.

"Let Us Know the Truth"

It was further agreed by those who have de-

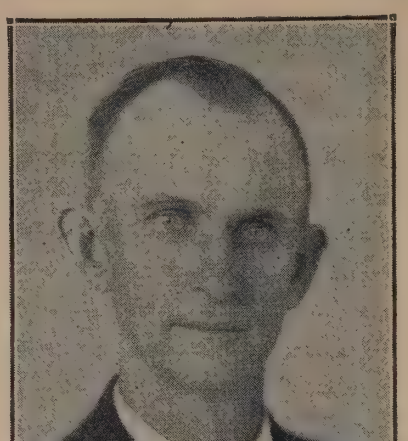
THE SOUTH'S FIRST MEDAL OF MERIT SIRE



B. W. KILGORE, JR., North Carolina

IT is often remarked that a person gets out of life exactly what he puts into it. The story of the South's first Medal of Merit bull is additional evidence in favor of this theory.

Oakwood D's Fox—the King of southern Jersey sires—is the result of thirty-five years of constructive Jersey breeding by R. L. Shuford, Catawba County, North Carolina. Starting in the Jersey business before dairying had gotten a foothold in the state, Shuford has pioneered and led in practically every forward move in the development of the state's dairy industry.

Official testing was given its start in North Carolina by Mr. Shuford's cow, Dioxide. She completed the first official record in the state of 654.83 pounds of butter. This cow is the dam of the South's first Medal of Merit bull as well as seven Register of Merit daughters.

It might not be amiss to give a skeleton history of this herd. Thirty-five years ago Mr. Shuford was in the same position that a great many southern farmers find themselves today. The way he solved his problem offers a way out to these farmers who will profit by his experience. To use Mr. Shuford's own words: "I realized, with a poor, worn-out farm, that unless I followed some different methods than were employed by my neighbors, I was up against it and had better quit farming and turn to some other profession." Mr. Shuford loved farming and turned to the dairy business and the Jersey cow. His herd and farm answer more forcefully than empty words whether or not his decision was a wise one.

R. L. Shuford, North Carolina, owner and breeder of the first Medal of Merit sire in the South.

"Buy the best and breed better" was the slogan adopted by Mr. Shuford in breeding up his herd. His first four cows were purchased from Kentucky. They were daughters of Signal, the old "Butter King," a bull rich in high producing blood and very prepotent in transmitting high production to his offspring. Eminent's Flying Fox, a son of Eminent, was purchased from the White Horse Farm in Pennsylvania in 1909, as the first herd sire. Flying Fox is the sire of Oakwood D's Fox and his progeny from the four foundation cows are largely responsible for the present herd.

Mr. Shuford has followed the practice of buying the best bulls he could find. Except for a few foundation cows, he has raised all his females. Good care of his young stock, hand in hand with their breeding, has been responsible for the high quality of his herd.

What is of real interest to the average dairyman is that Mr. Shuford has balanced his farming operations with his dairy business. Practically all feed consumed by the herd is grown on the farm. Instead of a poor, worn-out farm, through a system of dairy farming, manure, and legumes, there is in its place 600 acres of as productive land as can be found in the South.

Oakwood D's Fox has been the senior herd sire at Shuford Farm f twelve years. His twenty-four Reg ter of Merit daughters include thr Medal of Merit cows, four gold med and one silver medal winners.

The three cows whose records ha made Oakwood D's Fox the Soutl premier bull, are:

	Milk Lbs.	Fat Lbs.	Age Yrs. M
Oakwood Fox Annie	16,438	864	8
Oakwood D's Brownie	17,929	860	7
Red Lady	17,195	860	8

August 27, 1926, the date Red La presented Shuford Farm with a fi new calf, marked a red letter day f the South and Mr. Shuford. The be efforts of Mr. Shuford's life ha gone into developing his Jersey he and the honor that now comes to h is a worthy reward. This achiev ment offers a new hope to young breeders to set their ideals high wi the assurance that they will get o of their work exactly what they p into it.

THE SOUTH'S FIRST MEDAL OF MERIT SIRE

This is Oakwood D's Fox, owned by R. L. Shuford of North Carolina. He has been herd sire at Shuford Farm for 12 years and his 24 R. of M. daughters include three Medal of Merit cows, four Gold Medal and one Silver Medal winners.

OAKWOOD FOX ANNIE, THE HIGHEST PRODUCIN DAUGHTER OF OAKWOOD D'S FOX

She is a Gold Medal and a Medal of Merit cow with a rec of 864 lbs. fat in 365 days.

The Cow Tester's Job

H. W. HYDE, IOWA

AT the end of my first year in college in 1916, I applied to Howard Barker, then head of the dairy extension work at Iowa State College, for a position as tester in a cow testing association. He sent me to an association which had just been formed in Cedar County, Iowa. Armed with what knowledge I had gained from a year in college and a boyhood experience on the farm, I went to take charge of the work.

What I learned that first year, both through my failures and successes, has been mighty valuable to me in later jobs of a similar kind. As I think back over that first experience in cow testing work, it occurs to me that an account of what I learned may be of service to other novices in cow testing work and also, perhaps, to farmers who are forming associations.

The first evening all of the members gathered at the secretary's home to become familiar with the work and there I learned most of their names.

I knew that if my work was to be of the most value to the members, I must get each farmer interested enough to want to better his own conditions and to become a booster. I began to study each family individually, not only the men but the women as well. I knew that if I could keep the women folks interested I would stand a better chance of making the work appeal to the men.

By the time the second quarterly dues were to be paid, some of the farmers began to question the value of the work. There are always a few people who expect a new movement to yield immediately a financial return greater than the costs that have been incurred. I remember well two farmers who were almost ready to drop out of the association. I made a special effort to get them to see the value of the work. Among the other things that I did for the one man, I adjusted his cream separator which proved to be leaving enough butterfat in the skimmilk to pay for two-thirds of his testing dues every month. The other man I induced to remain in the association until the year was up; I incidentally left him a "Henry's Feeds and Feeding." So interested did he become in studying this book that when I came back he bought it.

I purposely left a few of those feed books with the farmers and before the year was past I had sold one to nearly every member in the association. As the winter months came on I helped the farmers plan better feeding rations, which in many instances reduced their feed costs and at the same time increased the amount of milk the cows gave.

At the time there were very few silos in that county so I gathered all the information I could from local farmers who had silos. I sent to the experiment stations for information concerning the food value of silage and gave this information to the farmers. Before the fall was over, I had sold eight silos to members of the association and several to outside farmers.

I managed to get the members of the association together once every month. We always had an interesting program followed by refreshments served by the women. I am not sure which was the attractive feature, the program or the refreshments but I am confident each get-together meeting stimulated interest.

About nine months after the association was started two of our members held public sales. Their cows that had milk records brought $15.00 to $30.00 more per head than similar cows that were not in the association sold for at other public sales. I took advantage of this as an inducement to secure members for the association and the two vacancies left by the farmers who had sold out were soon filled and from that time on we had several applicants for membership on our waiting list.

I learned early in the year that order to succeed I must do just little more than the necessary dut as a tester. I helped the farm plan their crop rotations, tested th soil for acidity, assisted them in s corn selection and taught them h to use the rag doll seed corn test I would help them cull the poul flock and in some cases I found m self helping the farmers in keep farm accounts. I would make s cial efforts to get information on a subject the farmers were interes in. I learned that it was the lit outside tasks that I did that made work interesting to all.

My efforts as a tester were by means in vain. By the end of year we had eliminated from farmers' herds 27 cows that had b kept at a loss, five members of association had purchased pure-b sires, and all the farmers had lear enough about better feeding meth to reduce greatly their feed costs a increase their net income.

I was well repaid for my extra forts. I felt that I had learned much from the members as they l learned from me. At the close of year the members presented me w a neat little sum with which to bu gold watch.

I later supervised other testing sociations and I attribute my s cess in them all not only to do well the things that were expected me but rather because I lent services freely in every way possib

ELECTRICITY IN THE COUNTRY HOME

ETHEL MORRISON-MARSDEN, WISCONSIN

NO mere man can do justice to the theme of electricity in a farm home. Perhaps he can umerate comforts to be gained by e installation of that great and ysterious force but he is quite help- ss to appreciate the fathomless nount of labor saved and the vast

LECTRIC WATER HEATER THAT OPERATES AUTOMATICALLY AND PROVIDES SCALDING WATER

The tank which holds the water is well nsulated.

old joy electricity brings to the rt of a farmer's wife.

Everyone lives in two worlds, one reality and one of dreams, and in t dreams of a country woman there sts electricity in the home bring- light, bringing warmth, saving ntless amount of work and en- y, bringing rest and happiness. Al now the time has come when se dreams may be utilized. Elec- ity is within the reach of nearly who care to utilize it.

The cost of installing electricity a farm home need not be great. very few years ago a farmer had irst build his own line, then wire own buildings up, install his own ures and put up his own trans- ner. Then if he cared to make a of this line to an electric com- y they would keep it in repair supply him with electricity or ce." The past year or two has a very great change take place.

The small companies throughout the various states have been purchased by large and powerful concerns that in many instances control the greatest portion of rights in a whole state. These large companies are anxious for more consumers and so have made it easy for almost every farmer to have it. The companies will build along the main travelled highways, right past your farm, and will supply the transformer that you will need. You will only have to build from this main line into your house and wire up your own buildings. These companies are also anxious for you to use as much juice as possible, so with this in mind they have made the rates so that the more electricity you use the cheaper it becomes. Hence your greatest economy, if you are going to install it, is to arrange to use as much as you can conscientiously. You must learn how to use it so that it will be not an extravagance but a necessity, and an economy not only from a laborsaving standpoint but from a financial viewpoint as well.

Any intelligent farmer who will devote a little study to electricity can do a great deal toward wiring up his own buildings. And then what help that needs be hired will not amount to much. The fixtures need cost only what you care to put into them and as to electrical appliances, you may add them one at a time as you feel you can afford them. Many can be supplied by local electric companies on the monthly payment plan if you care to undertake that method.

It is hardly necessary to speak of the advantages of the lights themselves as compared with kerosene lamps; the cleanliness, the amount of labor saved in cleaning and filling these daily, not to mention sweeping up broken lamp chimneys, the vast difference in the light itself and saving on eyesight, the convenience of a bright light by simply pushing a button or pulling a chain, and most important of all the safety, no danger of explosions, fire from overturned lamp or lantern. The safety in the barn is of as great value as in the house, for always where there is a lamp or a lantern there is a possibility of fire.

To my mind the electric washing machine and the electric flatiron are the most essential of all labor saving devises. The washing machines have so very many advantages and they cost so little to operate. When my babies were tiny I used my machine three times a week instead of washing daily by hand. The new machines do away entirely with the necessity for scrubbing anything on the washboard. One of these will do a large washing thoroughly in a short time. In an hour and a half at most from the time your water is hot, your washing can be finished and on the line, and probably you can have your floor cleaned. The swinging wringer is a great improvement, thus enabling you to wring not only from your machine but from your rinse tubs with it as well. The safety devices upon it protect both your hands and your clothes. Both the washer and the wringer save greatly on the wear and tear upon the clothes over the old type of hand power washers or the scrubbing board.

THE ELECTRIC WASHER IS ONE OF THE MOST ESSENTIAL LABOR SAVING DEVICES IN THE HOME

The first cost of an iron is insignificant and no words can tell of the saving of burns and steps by using an electric iron. The work is done much nicer, for the iron itself is heavier and holds a constant heat. An iron costs more to operate than a washer (any appliance that has a heating element costs more to operate than one using a motor), so for this reason one must learn how to use an iron. It should be planned if possible to do all the ironing at one time as this will only cause the iron to be heated once. As the iron retains the heat some time it may be turned off before one finishes and sundry small articles such as handkerchiefs, etc., done the last thing.

Next I value my vacuum cleaner. It is such an easy and enjoyable way to clean a rug, simply to run this machine over it. It picks up everything on the surface and the vacuum draws the dirt out of the rug itself as well. In just a few minutes' time you can run over all of the rugs and have your house looking spic and span. It matters not whether the children have cut up papers all over the floor or whether the men have taken off their boots which have been half full of oats and chaff and trailed this all over the rugs, the vacuum cleaner will pick it up and it costs comparatively nothing to run. And

A PUMP DRIVEN BY AN ELECTRIC MOTOR

no one can estimate the true value of it at housecleaning time.

My electric range brings me the greatest amount of pure joy of anything I possess. It bakes the most like a good old fashioned cook stove of anything I know of. The ovens are so well insulated that one can use them almost the same as he would a fireless cooker. By heating to the temperature desired and then turning the heat onto low, the oven will retain the same temperature for an indefinite time. Even after the juice is all turned off it will stay hot for three hours or longer. I bake many, many things after my heat is turned off. There are two heating elements in the oven, and each one has three heats; one element is in the bottom of the oven and one in the top. Thus it is an easy matter to reach any desired amount of heat, and with such a perfect heat all about your baking it is almost impossible not to bake successfully. Meats may be broiled deliciously in the top of the oven and are far more healthful than when fried. Of course to operate a range economically one must do as much baking as possible at one heating but the ovens are large and many things may be baked at one time. The burners all have three heats, thus enabling a person to turn the heat on low, medium, or high. As a rule, I turn it

(Continued on page 478)

LECTRIC MOTOR FOR THE SEWING MACHINE IS ANOTHER LABOR SAVER

"MY ELECTRIC RANGE BAKES THE MOST LIKE A GOOD OLD FASHIONED COOK STOVE OF ANYTHING I KNOW OF"

HOW EUROPE FARMS

A Dutch Potato Grower

HERBERT R. COX, NEW JERSEY

This Dutch potato grower is in earnest conversation with the county agent about the certified seed potatoes in the foreground.

AS in most of the North Europe countries the potato is a more important crop in Holland than it is in America. Holland grows both early and late potatoes. The latter are raised on farms of fair size and on the heavier soils of the provinces of South Holland, North Holland, and Zeeland. Early potatoes are a truck crop and are raised intensively on small holdings. An important early potato section is in North Holland near Alkmaar and Hoorn where about 7,500 acres are devoted to the crop.

With this preface let me introduce to you Herr Jan Hoogland of Lutjebroek, whom the county agent selected as a typical early potato grower of the district; typical in the size of his farm and kind of business, but more progressive than the average.

Mr. Hoogland has five acres of land and raises just two crops, early potatoes and cauliflower. The potatoes are planted in March and harvesting begins about June 1. By June 15 harvesting is at its height. The potatoes may be planted about three feet apart, in which case the cauliflower plants are set between the potato rows a few weeks before harvest. Often potatoes are planted two feet apart and the cauliflower plants are set after the potato plants are harvested. So the same land produces two crops a year. There are a few other crops raised on a small scale in this section, including cabbage and beets.

The land in this locality, like all of western Holland, has been reclaimed from the sea. It is level as a floor with ditches and canals everywhere from one to three feet below the soil surface, which is at or a little below sea level. Windmills raise the water from the ditches into the canals which carry it off to the sea. The soil is a very productive loam to sandy loam.

Part of Mr. Hoogland's farm, the part surrounding the house, he owns. The rest of it, located a quarter mile away, he rents. A fair valuation of this land is about $1000 an acre, exclusive of buildings which are worth about $1000. Please remember that this is a long distance from any city and that this figure is strictly based upon its farming value.

From the fact that this farm raises only two crops you may conclude that it is highly specialized. There is not even a home garden. Mr. Hoogland finds it cheaper to buy his vegetables and other table supplies from hucksters. He has no cows, horses, nor chickens even. There is one dog and one cat. There is also a small canal boat by which Mr. Hoogland does all his marketing. The house is equipped with electric lights.

The family consists of Mr. and Mrs. Hoogland and four children, the oldest a girl of 18. Four other children have come into the home and have passed away. All of the work on the farm is done by the family. The land is turned in late winter by hand with a spading fork and is smoothed over with a hand rake. After the rows have been marked out, potatoes are planted with a hand planter, an ingenious tool which makes a circular hole in the ground in which the tuber is placed. Cultivation is done by a hand scuffler hoe.

Mr. Hoogland and his oldest daughter who does her share of the farm work.

As a rule, the whole tuber is planted. The rate of planting is about 50 bushels per acre for three-foot rows and higher for two-foot rows. Early potatoes are always planted in Europe at a higher rate than late potatoes, in order to hurry the crop on as fast as possible. The potato crop is heavily fertilized with ammonium sulphate, acid phosphate, and muriate of potash. These ingredients are applied separately, the phosphate and muriate before planting and ammonium sulphate after planting.

The kind of seed potatoes used is given careful consideration by the up-to-date Dutch growers. They are fully alive to the necessity of having seed free from mosaic, leaf roll, and other diseases. There is a system by which certified seed is produced in A, B, and C grades. Mr. Hoogland sells potatoes both for seed and for table stock, according to the market demands. His seed potatoes go largely into the A grade, some of them into the B grade. He is working closely with the county agent in order to produce the highest possible grade of seed. His seed is sold mostly to Germany and Belgium. The variety largely raised is the Scottish Mouse. His potatoes for market are put into his canal boat and taken to a great farmers' co-operative potato auction at Bovenkarspel, a few miles away, which is deserving of a complete description, but space will not permit of it in this article.

The three implements used in growing potatoes on this farm—a fork to turn the soil, a planter, and a hoe.

The yield of early potatoes on this farm averages about 126 bushels per acre. The crop for market is dug in early June when the vines are still green and long before they have made full growth. An average price for the crop is 3.6 cents per pound, which makes a gross return of about $272 per acre.

Cauliflower plants, which are set out after the potatoes, are raised both in frames and in the open. The seed comes from Italy. An average return from cauliflower is about $110 per acre. No additional fertilization is needed for this crop. The heads are placed in the canal boat and floated off to the auction.

It may be seen, therefore, that the gross return per acre from both crops is about $382 on an average, which is $1910 from the five acres. These people are thrifty, like all the Dutch, so that there is a fair margin of clear profit left nearly every year. The principal item of expense is interest on the investment, which is 5 per cent on $6000, and amounts to $300 a year.

As we left the house for the railroad station in the boat propelled by Mr. Hoogland with a long pole, he called my attention to a neighbor's house which could be seen above the potato plants lining the canal. At the peak of the roof was an enormous bird's nest and in the nest stood a stork appearing to be nearly five feet high. This bird comes back to this same nest every spring after spending the winter in a southernly climate. The stork is a bird of good omen and is well provided for by the fortunate owner of the house.

SOIL FERTILITY AND ANIMAL HEALTH

F. J. SIEVERS, WASHINGTON STATE COLLEGE

AMONG the numerous problems confronting the Western Washington dairyman, there is possibly none that is causing him more concern than the matter of the health of his cattle.

He is confronted with diseases of his stock that apparently do not respond to the well known remedies and treatments nor do they lend themselves to a very satisfactory diagnosis. The only matter of diagnosis that appears to be definitely established concerning these difficulties is the fact that the problems so common in Western Washington are not known or recognized in other portions of the state. This fact alone would lead one to believe that there are some conditions here, either natural or artificial, that can be held responsible. In this regard it is, however, fairly well established that artificial conditions or practices as they affect the dairy farmer play no part because the problems referred to have been experienced under practically all kinds of practices in spite of any precautions for their prevention. It would appear then that there might be something about the natural conditions under which plant and animal life develop in this section of the state that could be held responsible. Certainly there is a big difference between the soil and the climate here as compared to Eastern Washington.

In short, is it possible, or does it seem logical, that many of these diseases like red water, non-contagious abortion, sterility, etc., so common in Western Washington may be caused by a lack of proper nutrition? If malnutrition is under suspicion it might be possible to obtain some evidence through an analysis of some of the representative forage products produced and fed to dairy cattle in this section.

The Soils Department of the State College of Washington approached this problem from this angle two years ago and since then has had an opportunity to make many field observations and a large number of analysis of soil and crop samples. Finances available were not sufficient to permit complete analyses of these materials and therefore main emphasis was placed on only two elements, viz., phosphorus and calcium (lime). Those two elements were selected because it was generally understood that they played a very prominent part in animal nutrition and also because it had been learned from previous work that western soils, in general, were not overwell supplied with either available phosphorus or calcium.

The results from these analyses were very striking in that it was found that when compared with soils of similar type from other sections of the United States, the Western Washington soils were much higher in their total calcium and phosphorus content. In spite of this, however, they were not only acid in reaction but also decidedly deficient in available or soluble phosphorus. This deficiency was so pronounced that satisfactory crops could not be grown on most soils unless phosphorus was applied either in the form of animal manure or commercial fertilizer. Where soils are most deficient and where manure or fertilizers are not used regularly, only those crops that draw less heavily on phosphorus could be grown satisfactorily.

While all crops require the same elements of plant food, it happens that legumes like the clovers and alfalfa draw very heavily on phosphorus and calcium. This heavy demand on the part of these crops together with the limited supply of these elements in the soil has made the growing of legumes so difficult and uncertain in large areas in the dairy section of the state that the farmer refuses to make any further effort to get these crops established in a crop rotation system. The result is that there is little or no legume or legume pasture available for feeding dairy cattle. The grass and cereal hays, due to their lesser phosphorus and calcium requirements are a safer crop on these soils and the result is that frequently the entire forage portion of the ration for the dairy cow is composed of such non-legume roughage.

Dairy cows used for both milk pro-

(Continued on page 483)

IDAHO'S ALFALFA SEED INDUSTRY

GUY A. PETERSON, WISCONSIN

SINCE pure-bred seed of a variety that is adapted to the soil and climate at hand is such an important factor in the success of nearly every dairyman, it may be of interest to recount some of the impressions that we gleaned from a visit to the heart of the pedigreed Grimm alfalfa seed industry in Bingham County, Idaho, last August. It was at the suggestion of that staunch advocate of more and better dairy hays, Professor L. F. Graber of the Wisconsin College of Agriculture, that we made this pilgrimage with letters of introduction to a number of the men who are doing their utmost to maintain and improve the qualities of Idaho Grimm alfalfa seed.

Although Montana, Utah, and South Dakota are also coming to the front as producers of Grimm alfalfa seed, Idaho in the past few years has

T. C. BLACKBURN MAKING A FIELD INSPECTION OF H. K. WILEY'S ALFALFA

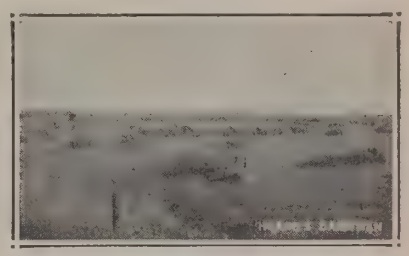
Mr. Wiley, on the right, is called the father of the Grimm alfalfa seed industry in Idaho.

been growing from 80 to 90 per cent of all pedigreed Grimm seed raised in the United States. What is more, most of this supply has been produced by members of the "Idaho Grimm Alfalfa Seed Growers' Association." More than 340 members of this worthwhile and successful co-operative organization operate seed farms in Bingham County within a fifty mile radius of Blackfoot. Bingham County is the world's greatest Grimm alfalfa seed county. In this respect it compares favorably with Millard County, Utah, which grows a very large percentage of Utah's crop. In view of the fact that the "Mormon State" produces about 45 per cent of all the alfalfa seed grown under the stars and stripes, this makes Millard the world's greatest alfalfa seed county. The greatest percentage of Utah's production, however, is of the common variety.

We See Many Indians

It was near nightfall as we drove along the splendid paved road leading into Blackfoot. On either side of pavement was a luxurious growth of alfalfa and sweet clover through which a considerable number of Indians, bucks, and squaws were riding. Occasionally we would see both man and wife riding upon the same horse. It seemed as we got into the city that nearly every fourth person we saw was a member of the Blackfoot tribe. They made an interesting sight as they came swaggering down the sidewalks with their coal black hair dangling over their chests in two sleek braids. Much of the seed growing territory was once owned by the Blackfoot Indians, so that is perhaps why the trademark of the association, "Blackfoot Brand," had been chosen, although we were told that very few Indians are engaged in the work of raising alfalfa seed.

This remarkable picture of the root system of an old Grimm alfalfa plant that has been allowed to develop by itself on George Line's farm shows how far the roots of these plants will go to find food and water. From top to bottom it measures six feet.



It happened that the officers of the association were holding a business meeting in their fine new warehouse that evening, so we had an opportunity to meet them. We wish to say in passing that if every farmers' co-operative organization was planned and manned as this one is, we would have fewer failures to record in the painful process of teaching the farmers to work together in marketing their own products. In spite of the fact that numerous attempts have been made to disrupt the organization and in spite of the fact that a number of farmers have forfeited their privilege of ever selling their seed through the association again, the majority of growers have "stuck by the ship" until this co-operative now commands an enviable financial rating. This only goes to show that farmers can get the necessary financial backing to operate a co-operative if they are willing to produce quality products and stick together.

Wisconsin Bans "Affidavit Grimm"

The few who "sold their birthright for a mess of pottage" and contracted their seed to unscrupulous buyers as "affidavit Grimm" are now finding their markets restricted. It did not take long for farmers who would not produce good enough seed to qualify for membership in the association to find that many seed houses were willing to pay well for "affidavit Grimm" regardless of the quality. Some seed dealers even offered two cents a pound more for all common alfalfa seed that the grower would sell as "affidavit Grimm." Wisconsin put a stop to the traffic of selling affidavit Grimm within her borders last October when she passed a ruling prohibiting the sale of any alfalfa seed under the name of Grimm unless it has been sealed and certified by a reputable state official.

Things were getting to be almost as bad with the "bootleg" Grimm alfalfa seed situation as they had been during the orgy of filled cheese that nearly wrecked the cheese industry a few years ago. We know of a dozen farmers in a single community who bought "affidavit Grimm" from a southern seedsman, only to find that they had purchased a common seed. As a result, their alfalfa winterkilled the first year because they were in a locality where the common variety will not stand up. The fact that it is impossible to tell the difference between Grimm and common alfalfa seed with the naked eye has made it possible for the dishonest seed dealer to sell a great deal of poor seed to dairymen of the northern states. It is because of this that government certification has been found necessary.

Where common alfalfa will withstand the winter there is little ma-

FIELD OF PEDIGREED GRIMM ALFALFA ON GEORGE LINE'S FARM CUT, BUNCHED, AND READY FOR THRESHING

INDIANS TAKING PART IN THE MONSTROUS CELEBRATION AT THE LAYING OF THE CORNERSTONE FOR THE AMERICAN FALLS, IDAHO, DAM

terial advantage in seeding Grimm, although we found that dairymen on the west coast are using it because they claim that it stands cultivation so much better than the common. When we asked Professor Graber why this is so he answered that he did not know unless it was that the Grimm variety has about 30 per cent more growth starts than the common, so if some plants are frozen out or injured in any way, those that remain send up that many more shoots.

Have Modern Seed Warehouse

But to get back to our story. Manager E. E. Sanders and President Ralph Davis took us through the warehouse and showed us with what care the seed is cleaned, graded, and scarified. If every seed house was as particular with seed we would have fewer infestations of noxious weeds than we do have. A government man is kept on the grounds for several months in the year just to break the seals. A few of the larger growers have cleaning machinery of their

(Continued from page 480)

AN ALFALFA THRESHING SCENE NEAR BLACKFOOT, IDAHO

Care is taken to prevent mixing at this time and a state field inspector seals the bags with an official seal to prevent mixing afterwards.

THE GREAT AMERICAN FALLS, IDAHO, DAM IN PROCESS OF ERECTION

It will insure a constant water supply for the alfalfa seed growers of the American Falls area, thereby automatically insuring a seed supply for the United States.

The famous Goodyear Pathfinder. Car owners have already bought nearly 5,000,000 of these lower priced, standard quality Goodyears.

Right in Your Home Town

You can buy tires through the mail of course, but one of the biggest factors in low-cost mileage you cannot buy that way.

It is the valuable *service* performed for you by your local Goodyear dealer.

He sells the world's finest tires. His prices are low. He has in stock the right size and type of tire for you.

He will mount your new tire on the rim, fill it with air, and long after the sale help you care for it so that it will deliver you its maximum performance.

The benefits of this helpful service are not listed in any catalogue. But they are available to you *now* in the store of your home-town Goodyear dealer.

They are the worthwhile fruit of the Goodyear policy: *to build the greatest possible value into Goodyear products,* and *to provide facilities so that users can get all this inbuilt value out.*

Goodyear makes a tire to suit *you*—whether you want the incomparable All-Weather Tread Goodyear, the most famous tire in the world, or the lower-priced Goodyear standard quality Pathfinder

Milk Stool Philosophy

J. J. SPRENGER, MINNESOTA

REAL loyalty to our work and dependability are jewels and the people possessing them are a blessing in all walks of life. But these very traits may develop a feeling in us that we are indispensable to such a degree that it can hinder both ourselves and those with whom we work.

As parents, we can often be in the way of our children by feeling that the work in the home and on the farm can only be successfully directed by us. While it is a wonderful blessing to be so completely lost in our work that we are not happy if the cows are not milked on the dot, we must remember that the taking over of responsibility on the part of the younger generation has never been the work of a moment but that it grows on us and that instead of allowing it to overdevelop in us, we need to develop patience and tact in order to develop in others that of which we may have too much.

There is also a sense of importance which can come to groups as they work together which tends to build a feeling of indispensability to the extent that individuals from these groups feel that the world could not get along without them or their group. This was very forcefully brought to my attention recently while calling on a farmer friend whom I found very much excited because he felt that we farmers were mistreated, downtrodden, and neglected on the part of the government as well as on the part of all of the rest of the folks and he was very outspoken in regard to what he thought farmers should do about it. During most of my stay at his home he v threatening that if he had his v he would try to get all of the fa ers to stop growing a thing, so p ple would find out that farmers c not be dispensed with.

During a short intermittence in excited conversation he remembe that he was to call a neighbor by t phone. So he rang for central while holding the receiver to his he said, in a very emphatic way, tell you, Mr. Sprenger, I have m up my mind that I will not do anot thing for at least a year," when suddenly remembered that he did have central. So he began to r about the poor operator who was shiftless and never tended to her b ness. But I knew he could not h heard her even when she did ans because of his excitement and that really needed to get a little of his medicine. So I told him that lik the girl was trying to practice things he was teaching. At first angered him, then suddenly he c to his senses and said, "What a a fellow can be, anyway. Here I that I should withhold my service a year while I felt that the girl sho be right at her post every minute serve me."

That suggested to me how m thousands from the very ends of earth are daily at work so that I have the comforts of life and I lieve that they, as well as I, are h py only as they are doing this in unbegrudging way.

The laws of service are the laws happiness and the laws of happi are the laws of service.

Landscaping the Mail Box

FLORENCE L. CLARK, IOWA

THE common type of sheet metal rural mail box mounted on an unpainted post makes a serviceable receptacle for incoming and outgoing farm mail, but by no stretch of the imagination can it be called beautiful, any more than a telephone pole can.

Miss Mabel Blunt has made the mail box in front of their farm in Fayette County, Iowa, attractive in itself and, besides, has given it a really beautiful setting. She built a little platform beneath the metal mail box, making a support for it by bolting two small steel braces to the post. A tiny house of sticks to look like a miniature log cabin was built on top the platform with the door of the mail box forming the front door of the house. The unpainted post was hidden from view and made to co spond to the box by laying sti about it, pryamid fashion.

The rustic mail box stands in fr of an attractive grouping of t and shrubs at the west corner of lawn. A winding path leads thro the shrubbery out to the mail b and "stepping stones" of large white stones have been placed in path. Back in the trees is a ru seat beside the stepping stones.

The rustic mail box of natural g color and the artistic approach t of white stepping stones among dark green of the shrubbery, deli the eye of the traveler of the roa he passes the Blunt home, but real thing is the pleasure the f family takes in their bit of mail beauty.

MAIL BOX AT FARM HOME OF MABEL BLUNT, IOWA

The Standard Ordinance Opposed

HOARD'S DAIRYMAN:—In your issue March 25th I notice a statement, Standardize Milk Ordinances," Mr. Ross B. Johnson of West Virginia. In this story Mr. Johnson es that Louisiana has adopted the ndard Milk Ordinance. In this tement he is very much in error. ere are only two or three towns in state that have adopted the ordance and are making any attempt enforce it, and in these towns, alugh the ordinance has been adopt- recently, the dairymen are already ing for modifications.

The cities of New Orleans, Baton ge, and Alexandria have rejectthe ordinance and, so far as we w, the state of Mississippi has er given it any consideration, and do know that the milk coming out Mississippi into Louisiana has er been produced according to the ulations of the Standard Milk Ordance. The Dairy Department of State University, the Louisiana te Dairy Association, and the te Commissioner of Agriculture e all gone on record in Louisiana opposing this ordinance, for the son that it is entirely too strint, theoretical, experimental, and -enforceable.

Mr. Johnson certainly makes a ng and unjust accusation against dairy industry of his state by asing that such a large percentage he children that have died is due poor supply of milk, and he atutes the cause for death of the dren to milk without giving any oritative statement whatever for e. Mr. Johnson's statements are radictory. The South has had rely too much of this kind of pubfor its dairy industry, which is of the factors that has retarded levelopment.

he quality of milk that is pro- d in Louisiana will rank well that produced in most any other e. The cattle in all of the comcial herds have been tested for rculosis, modern barns and pment are in use, and great progress has been made toward improving milk sold in this state. The pros- s for the development of the y industry in Louisiana is by far best it has ever been and we are sed to the adoption of the sod Standard Milk Ordinance for reason that we know that it is in the experimental stage and we are in no sense of the word y for this highly technical set of and regulations. C. H. STAPLES. uisiana State University.

A Week in Georgia

ARD'S DAIRYMAN:—Returns being to come in from Georgia's v-Hog-Hen Week" indicate that een 5,000 and 10,000 farmers in state are planning to change cotton to dairy farming this and that at least five train-loads ock will be required to meet the nd this year.

e "Week," which was held from h 7 to 13, was for a dual pur; first, to find out if possible, many farmers wished to change cotton farming to diversified live stock farming; and, second, e what business men could do rds helping to finance farmers ng to make this change. It was ed that the average cost of preg a farm for stock was $500 and if only ten per cent of the farms put on a live stock basis it l require an expenditure of thing like $8,000,000.

one city a leading newspaper ed five registered bulls to farmers of the community wishing to improve their stock. In another, leading business men got together and offered a series of prizes not to the best cotton grower, but to the farmer showing the most profit from a small dairy herd. In one county meetings were held during the "Week" at every schoolhouse in the interest of more and better live stock. And in a group of ten counties a county agent organized the first 4-H calf club in that section of the state.

And so down the list. Everywhere, as a result of the "Cow-Hog-Hen Week," one finds bankers willing to lend money on live stock for the first time, convinced that the security is better than cotton. Everywhere there are businessmen willing to extend credit on fencing, cement, machinery, and equipment needed for starting in the dairy business. Everywhere groups of businessmen are providing funds for the purchase of stock, to be distributed to farmers who cannot otherwise get a start.

Surveys made during the week are a revelation in the changed attitude not alone of the farmer himself, but of the banker and businessman towards live stock farming. All have learned suddenly the lesson that the Georgia Association has been trying to teach for years—that live stock must be the basis of Georgia agriculture.

The New and Finer

PONTIAC SIX

..at New Low Prices

Only by utilizing the tremendous resources of General Motors could Oakland produce such an amazing value as the New and Finer Pontiac Six at its new low prices.

Such arresting beauty and style appear in no other low-priced six—for none other has the advantage of bodies created and built by Fisher.

Such spirited performance and dependability characterize no other six of its price—for none other was developed on General Motors Proving Ground and incorporates the discoveries of General Motors Research Laboratories.

The distinction of the New and Finer Pontiac Six is emphasized by narrowed body pillars—by longer, lower contours—by heavier, more sweeping crown fenders—and by a deeper, more modish radiator.

Its smartness is accented by fresh and original combinations of Duco colors—ranging from Beverly Blue and Satin Black on the Sedan to Cherokee Gray and Brevoort Green on the Sport Cabriolet.

And its mechanical excellence is increased by the addition of such unexpected features as foot-controlled tilting-beam headlights, longer transmission and brake levers, larger steering wheel with aluminum spider, and an even smoother, more powerful clutch.

The New and Finer Pontiac Six towers over its field as a monument to the vast constructive influence that only General Motors commands—for in no other six of equal price is such dazzling value revealed.

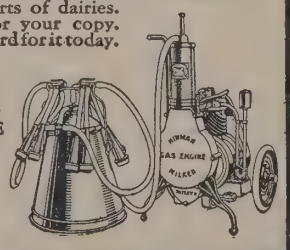
yes Judge by Results

There's one best way to judge anything. That's by *results.*

And *that's* the way we ask *you* to judge the Hinman Milker.

You can't tell what a milker can do for you until you try the Hinman.



But you can tell by its *results* that the Hinman is a machine you want on your dairy.

19 straight years of successful results. Not on a few dairies—on *thousands.* Not in one or two localities—*in every good dairy county.*

The Hinman has *proved* itself a milker you can *depend upon* to do that milking job successfully day after day, year after year.

Send for the HINMAN CATALOG

It's a book you'll like. Shows you what the Hinman *has done* and therefore *can do for you.* Page after page of real *experience*—in all climates—under all conditions—on all sorts of dairies. Write for your copy. Drop a card for it today.

WHY NOT GROW LUMBE

CHAS. B. WING, OHIO

THIS state is trying to encourage forestry. As an aid to this, our experiment station now gives to farmers, at only the cost of packing, all the tree seedlings that you ask for, with only the proviso that you plant them under the instructions of the state forester, that you fence and keep stock out for at least ten years, and that you use them entirely for forestry purposes. In addition to this help we now have a law that permits us to carry land used for forestry purposes at half the ordinary tax rate. When the timber is cut off, an additional tax is charged but not excessive even then. What startled me, however, was to dig in and figure the probable returns from an acre of forest, planted and handled under direction of skilled foresters.

To begin with, they tell me that an acre so handled will far outyield any natural growth of timber ever seen in this country. After studying the matter I believe this statement to be true. For instance, we are expected to plant these little trees 5x5, 6x6, or 7x7 ft. This starts them right and gives the tree a tall, slender bole. Naturally you will either thin these out or nature will do it for you, but in the end you will have every tree to the acre that can possibly be grown, a condition that I have never seen in natural Ohio woodlands.

The Ohio Experiment Station is decidedly conservative upon all subjects, rather leaning backwards in its policy of never overstating a matter, but they say that a 50-year growth of white ash will yield 20,000 board feet per acre, red oak about 25,000 ft., tulip poplar 25,000 ft. in 40 years; other trees in like proportion. What will this lumber be worth in 50 years? I asked this question of two of my local men, Horr, who has handled a saw mill and lumber yard all his life, and Alexander who has done similar work for a lifetime, not only here but in other parts of Ohio and in a large way. They agree that oak, one of our standard forms of timber, has doubled in price in the last 20 years. They say it is conservative to say that the standard varieties of timber will double in the next 50 years. Alexander thinks it will do much more than that. Authorities agree that we are using timber up six times as fast as we are producing it.

Taking four of our standard varieties of timber, oak, walnut, white ash, and hard maple, as an index, the present value, in the log, here, is about $50 per 1,000 ft. Walnut is $75. If it is worth just double in 50 years it will be $100 for the ave If the Ohio Experiment Statio telling the truth, an acre will pro 20,000 to 25,000 feet in 50 years' The former amount would, ther worth $2,000 per acre. If w doubled in price and made 20,00 it would be worth $3,000 per acr

In a vague sort of way I have it on my mind for years that we using up our timber too fast; th famine time was probably co that somebody ought to do some about it. However, I had been oughly taught that we could no ford to grow timber on good, f land that was meant for corn; the place to grow timber was on hillsides where land was cheap.

These figures place an entirely ferent aspect upon things for m live in one of the best parts of where land is fertile, alfalfa and thrive, and we have felt that foot should go into our major c Before the war our best land worth $175 to $225 per acre. U the present depressed conditions still worth around $85. Our f probably average as much as acres.

In practically all lines we are ducing too much of nearly all crops, and our farms have to be ated with considerable skill to any net profit at all. A very in gent neighbor, on rich soil, stat few days ago that, from an in ment standpoint, no farmer here pay over $60 an acre for a farm expect to receive a net return of 3% on his money. I think tha majority of our farmers would with his statement.

I asked a number of our farmers if they thought we coul every farm of 150 acres or ove off 10% or 15 acres, fence it, an get about it—still growing as stuff as we do now. Every one yes and added that we would more money than we do now.

My friend, Rogers, planted out 200 acres to forest 20 years ag says that our fertile soils grow ter trees and grow them faster the poor soils that I had sup were best adapted to the purpos observation is that he is right.

Then it comes right home th have a regular gold mine w reach; that it need not cost us h anything; that we can spare, 10% of our most fertile land wi any loss of total production; t is up to all of us, rich as w poor, to grow this timber; tha net returns upon rich land w good enough to suit anyone, and

ATTRACTIVE FARM HOME OF B. C. GAISER, INDIANA

e need not hand this all over to the ›or hill farms.

All of us carry life insurance. With ost of us it is quite a burden to keep e payments up. If a reliable life in- ırance company offered to pay to ır heirs as much as 15 acres of good nd given over to forestry figures, at : low a cost as this figures, how eag- ly would we grab it!

Rogers says we must figure some st of planting the trees but that it not large. That we must cultivate ıd keep the weeds down for at least ree years, and that in time we ould go in and thin the trees, cut- ıg out at least three-fourths of em. All of this does not sound very rmidable to me, and for my own rt I intend to put out a small piece thin a year.

our-H Club Work in Care of Milk

HOARD'S DAIRYMAN:—Junior proj- ; extension work has reached about ery phase of rural life and it seems nost impossible to find a new ave- e of its activity. Recently, while at e State College of Agriculture at ›rnell, my attention was called to mething different by Professor E. Guthrie which I doubt has been ed before. It is Four-H club work the "care of milk." Clean milk ›ans different things to different ›ple. Milk may be free from dirt d still contain millions of bacteria, ıny of which ought not to be there. ›e test of the care of milk in this ›tance is the sedimentation test and count of bacteria.

This experiment is being tried out the town of Bainbridge. The Dry lk Company has a well equipped ınt in that town and maintains a ›y good laboratory. The tests for liment and the count for bacteria › made by the director of this lab- ›tory, Dr. Supplee. The leader of › club is Professor Casey, principal the high school. The members of › club to date are Carlton Loomis, retary; Milton Dean, president; rriet Bennett, William Horrieter, l John Lord. The results of the ts are sent to Dr. Guthrie at Cor- l and scores are assigned. The ›teria counts went as low as two ›usand and from that to somewhat ›ve. In one instance the count was 000 but the same worker soon got vn to 11,500 and has time left yet improvement. Scores as deter- ıed by Dr. Guthrie ranged from 80 100 which is doing well indeed.

nstructions to the worker call for: Milking at least one-half can of milk › times or oftener each week dur- October, November, April, and y. 2. Cool the milk twice each of se months. 3. Wash the utensils ce each of these months. 4. Take ıples of milk for counting twice h of these months. There is also a e stating it is expected that the ling of the milk, washing of the nsils, and taking the samples will be done on the same day. The ıpling it is suggested be done on first and third Mondays of each of four months.

'he worker is expected to report, is asked first, "How many cows how much milk do you ordinarily k when not doing this junior ex- ›ion project?" Then he is asked give a description of the sedimen- on test and of the method of nting the bacteria in the milk. ›re was originally a request for ›rmining the bacteria on the uten- and a report of the method and of ılts. I cannot help feeling that if work goes on this will be included r as clean utensils often deter- ıe largely the condition of the milk. While Professor Casey, Drs. Supplee and Guthrie have each contributed their share to the success of this work, it is of course understood that the county junior project leader, H. L. Case, has been back of the whole program.

It would seem that this is an essential line of work but it is new and perhaps has its drawbacks. One of these is the difficulty of showing tangible results. Samples and scores may be taken to the fair it is true, but it still lacks the incentive of ownership that comes to the worker who has a fine calf or some pure-bred poultry or even a nice lot of vegetables to own and to exhibit. Suggestions as to the way that something of a working incentive may be added to the project would be helpful.

New York. H. H. LYON.

I am the friend to a man when I can think aloud in his presence.—EMERSON.

NASH

Leads the World in Motor Car Value

Unique Beauty—a 7-Bearing Motor

and an Array of Costly Car Features

A pronounced advantage the De Luxe Light Six Sedan enjoys over other cars in its field is its 7-bearing motor.

As contrasted to a Four or to a Six still powered with the older type 3 or 4-bearing motor its performance superiority is so great as to be almost unbelievable until you actually experience it.

You'll find it trigger-quick in getaway, of great power and speed, and with the supreme smoothness and quietness inherent only to the 7-bearing type of motor design.

Its finely-modeled body, of genuine hardwood construction like the world's highest priced cars, is a symphony in blue, with the lighter shade of the body proper and the fenders handsomely set off by the darker tone of the upper body.

In the interior there is further evidence of costly quality, for Mohair Velvet is used for the upholstery, the steering wheel is of solid walnut, and the instrument board and window ledges are of walnut finish. Among many notable attractions included in its standard equipment are front bumpers, bumperettes, motometer, 4-wheel brakes, and 5 disc wheels.

And Nash has set the price so low as to be but little more than that of a Four or cheap Six. The Nash price range on 26 models is from $865 to $2090, f. o. b. factory. (5448)

The Holstein Way

The Holstein cow's a wondrous thing;
She makes a feller's pockets ring;
She fills 'em full and runs 'em o'er
And pads up bank accounts, galore.

Where'er you find the black and white
You know the country must be right;
And men who prosper greet the day
And praise again the Holstein way.

This Holstein way is paved with jack
That springs up in the Holstein's track;
There men with milkpails point the way,
And sing of "sweet alfalfa hay."

The way is lined on either side
By buildings, planned with care and pride;
And healthy children's faces shine
To crown their bodies, fat and fine.

Their mothers come to view them there
With faces still unlined with care;
Their laughter rings out glad and free
And echoes "Holstein!" o'er the lea.

And all the bossies graze serene,
Out where the grass is sweet and green,
Content to prosper those who join
The black and white for ready coin.

One Lever Locks 2 to 50 Cows

THE greatest time-saving convenience ever invented in barn equipment is the West Bend Automatic Stanchion with locking, releasing lever—**the original, lever-operated, swinging stanchion.** Costs no more than ordinary stanchions that must be closed and opened singly by hand. It also assures safety in locking up or releasing cows. One throw of the lever locks or releases the entire row of cows, controls from 2 to 50 stanchions. **Cow stops are operated at the same time,** guiding the cows into the stanchions. Enthusiastic owners everywhere. **Write today** for big free catalog showing complete line of West Bend Barn Equipment.

If Your Dealer Does Not Handle Goods Advertised in Hoard's Dairyman—Ask Him Why!

This cross-sectional view shows how the working parts on the John Deere are fully enclosed and automatically oiled.

No Other Farm Engine Has These Advantages—

—complete enclosure of all important working parts within a dust-proof case;

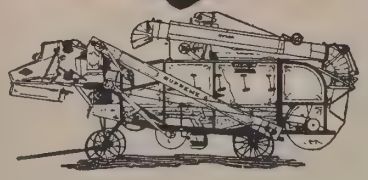
—an automatic oiling system that does away with all sight feed oilers and grease cups;

—an engine that will run until the fuel is exhausted without one moment's attention;

—no gears exposed or shafts extended on which clothing might be caught—unusually safe for the boys and women folks to operate.

These are a few of the outstanding features in the John Deere Type E Gasoline Engine that you are sure to want in your engine—advantages that mean longer service, lower upkeep costs and easier operation.

See the John Deere Type E at your John Deere dealer's. It's a real advancement in farm engine building. Built in 1-1/2, 3 and 6 H. P. sizes. You can also get a John Deere Direct Drive Pumping Outfit.



FREE BOOKLET TELLS ALL ABOUT IT

This tells all about this remarkable farm engine and fully illustrates its construction. Write for this. Address John Deere, Moline, Ill., and ask for booklet WS-814.

DELICIOUS MILK DRINK

P. S. LUCAS, MICHIGAN STATE COLLEGE

TIME was, when milk was regarded as the beverage for the young only, but those days, happily and fortunately, are forever past. Nowadays one meets such slogans as "Milk for Brawn and Vim," "Milk for Men," "Milk for the Laborer." These slogans are vouched for by the best of nutrition experts. Among them may be mentioned the names of McCollum, Osborne, Mendel, Sherman, Hart, and Steenbock. These are the foremost of American scientists making a study of nutrition. The findings of their research studies have been so generally broadcasted by educators and the press that there is today very few who doubt their value.

Milk is best as a food when consumed in a sweet condition as whole milk. There is one exception to this statement as will be noted later. There are many, however, who dislike the taste of sweet milk or who have a liking for special milk drinks for the sake of variety.

Fermented Milks

Years ago the famous Russian scientist, Metchnikoff, published a book entitled "The Prolongation of Life," which created a great stir among nutrition workers. The book was largely the result of a long study of the conditions which might be responsible for the exceptional long span of life of the Balkan peoples. Metchnikoff came to the conclusion that this longevity was due to the fermented milks consumed in such abundance by the inhabitants of this southeastern portion of Europe. His theory was in brief about as follows: Old age is hastened by the presence of putrefactive bacteria in the intestines, the products of which are antagonistic to health and vigor. The type of bacteria, Bacillus bulgaricus, responsible for the fermentation of the milk drinks, being ingested with the milks, proves detrimental to the growth of putrefactive bacteria and soon these are displaced in the intestine by the Bacillus bulgaricus. In this manner intestinal putrefaction is decreased.

Metchnikoff's theory was at first considered fantastic but in many details exists at present. The generally accepted opinion at present is that the bacteria Metchnikoff wrote of do not survive the acids and digestive juices of the intestine so as to exercise their prohibitive action on the putrefactive bacteria. Ferme milks have a beneficial influenc the system but their beneficial ef are probably due to milk rather to any bacteria or lactic acid.

Bacillus bulgaricus sours mil such a high degree that the ave consumer does not care for it. H a group of lactic acid bacteria commonly used in this country t complish this purpose. When bacteria finish their work the may be said to be mildly sour. tures of these bacteria in the for small pellets may be purchase many drug stores. Skimmilk is teurized by being heated in the t to 145° F. and held at that tem ture for 30 minutes. It is then c to 72° F. and the culture tablet ed. It is held at 72° F. until so after which it is best cooled to as degree as possible. When ready consumption the curd may be br up by stirring or pouring from container to another.

This type of fermented mil made in large quantities by the plants of the country and is sold ally as "cultured buttermilk" or der some patented trade name. not a buttermilk and should nc so regarded. So far as bacteria concerned, it is vastly cleaner ordinary buttermilk. There is nc ficulty in making it in the hom is also available at low price city milk plants of any size.

Chocolated Milk

Probably the idea of making olate milk came from the ice c soda and sundae. Certain it is the tastes of chocolate and milk well. This drink may be made very little inconvenience in the h It is a mixture of milk and choc syrup in varying proportions, bu ually of one part syrup to two of milk. In those cases where syrup is made at the plant r than purchased, cocoa instea chocolate is used. Chocolated when made according to patented mulas such as those of "400," " Drink," etc., contains a syrup ble to a particular flavor or flavors.

Judkins, in his book, "Principl Dairying," gives the following good formula: Mix one pound with 12 pounds sugar, 2 teaspoo cream of tartar, ¼ teaspoon c mon, and 8 ounces cornstarch. A gallon water and boil a few min

Waverly Creamery Association, Waverly, Minn., is a non-stock co-operative ass ciation. To organize the company they took a note of $10 per cow from each patro and used it as collateral to borrow money with which to erect the building. One ce is deducted from each pound of butterfat until the plant is entirely paid for. The a sociation has now been operating for about 25 years. The new building erected i 1917 cost $18,000 not including much of the equipment which was brought from the o plant. The annual output is 225,000 pounds butter, all of which is made into one-poun prints. They have a special trade in Philadelphia that takes all the output at 1½ cen above New York Extra. The money received is divided by the pounds of butter pr duced to ascertain the price that can be paid per pound fat to their 140 patrons, fir deducting the one cent per pound for sinking fund to pay for the building. Milk mu be delivered to the creamery every day, and the cream four times a week.

Cool, add 2 to 4 ounces of vanilla, and use 1 part of the syrup to 6 to 8 parts of milk. Two pounds chocolate should be used if substituted for the cocoa.

In the Michigan College plant, the syrup is made by boiling 2.2 parts by weight of cocoa and 4.4 parts by weight of sugar with 5.5 parts by weight of water. This syrup is used at the rate of one part to two parts of milk. A dark colored cocoa is preferable to one of light color. Cocoa will settle out of the mixture much more readily than will be the case if chocolate is used. It is readily remixed, however.

Acidophilus Milk

Acidophilus milk is the exception mentioned at the beginning of this article. It is a fermented milk that does what Metchnikoff thought Bacillus bulgaricus would do. The germ used is Bacillus Acidophilus. It survives digestion and arrives in the lower intestine where it will live and thrive if properly fed. A large consumption of milk or milk sugar by the individual will give it the food it needs.

It is very popular at present to take the acidophilus milk diet and many beneficial results are being obtained from its use in intestinal troubles. Its preparation requires considerable skill and care, which has made its price rather high. Because of the difficulty in growing the organism and keeping it uncontaminated, the preparation of the drink in the home cannot be recommended.

Eggnog and Juleps

Eggnog is a milk favorite of long standing. It is made by beating the mixture of an egg, 1 teaspoon sugar, a sprinkle of cinnamon, a few drops of vanilla, and mixing thoroughly with a glass of milk. This drink is especially desirable and nutritious, being unusually rich in proteins and minerals because of its egg and milk content.

Spiced milk is made by adding a mixture of a teaspoon of sugar and a sprinkle each of powdered cloves, cinnamon, and nutmeg to a glass of hot milk. The mixture is beaten smooth and is served hot.

If a portion of a carbonated bottled drink, such as ginger ale or root beer, is added to a glass of cold milk, a pleasing flavored product may be obtained. These give the mixture a "snap" because of their carbon dioxide content.

Buttermilk lemonade is made by adding sugar and lemon juice to fermented milk. A quantity slightly in excess of the amount used in lemonade is necessary to be predominant over the flavor of the soured milk. This drink is best when served very cold.

A convenient method for the quick preparation of certain milk drinks is to make a syrup of medium thickness by boiling a mixture of sugar and water. This is divided into portions and flavored heavily with extracts of the variety desired. These are held as stock materials to be used when desired. Flavors recommended are strawberry, pineapple, vanilla, orange, lemon, cherry, maple, root beer, and grape. Simple milk drinks are made by adding 1½ ounces (3 tablespoonfuls) of any of syrups to ¾ a glass of milk. Juleps are made in the same manner except that an egg is beaten into the mixture. In any of the drinks a small amount of charged water will add zest and character.

Malted Milk

Malted milk is a fountain classic. To mix, add to a half glass of milk a dipper of ice cream, an ounce of a flavored syrup, two teaspoons malted milk and beat thoroughly. It is served either hot or cold.

The two popular hot milk drinks are hot chocolate and Cafe au Lait. A good formula for the former is to mix two teaspoons cocoa with enough hot milk to make a paste, and finish filling the cup with hot milk. Add whipped cream. The latter is made by preparing coffee to four times its usual strength and by adding to each 1½ cups, 5 cups of hot milk. This procedure of course enhances the food value of the drink.

These are a few of the methods of making for variety so far as milk is concerned. They may prove attractive to the jaded appetite. They possess merit in proportion to the milk they contain. Wherever whole milk may be taken, it is preferable. After all, what is so refreshing as a glass of cold, pure milk?

The Farm Lease in Wisconsin

This is the title of a new bulletin just issued by the Agricultural Experiment Station at Madison, Wis. It contains a discussion as to the number of rented farms in Wisconsin and the different methods under which these farms are rented. It also discusses the advantages of the different forms of rent that are in use and finally gives a definite form of lease both for cash rent and on the stock-share basis.

Let's look inside

Outside—all tires look very much alike. Their real worth is told only by the "road" or by looking inside.

QUALITY is seldom visible—more often it is told only by use. The quality of a tire is known by the number of miles it has traveled. And the quality can easily be cut down to fit a selling price.

Riverside tires are made with a heaping measure of quality, without regard to what the price will be.

They are sold at the lowest possible price for equal quality. **We do not believe any power can produce for less money a tire that is the equal of Riversides.**

Ward's High Quality Is Always Maintained

Ward's is a low priced house. To always offer you a saving is our work—is our duty to you. But we regard it a greater duty to always safeguard your satisfaction. We do not offer you goods that will disappoint you in service, *goods made to sell but not to serve.* We place your friendship, your confidence in us, absolutely first.

Quality First—Then Low Price

At Ward's we make low prices by expert buying in all the markets of the world. We use 60 Million Dollars in Cash to secure low prices for you. We buy in the largest quantities, by the car load, by the thousand dozen, to secure lower-than-market prices.

No merchandising power in the world can buy for you cheaper than Montgomery Ward & Co. *No one can sell equal quality at a lower price.*

For Fifty-five Years, Ward's has dealt with every customer in the full spirit of the Golden Rule. To give you the largest savings, and the utmost in satisfaction and service.

But we never sacrifice Quality to make a seemingly low price.

A Price too low—makes the Cost too great!

EDITORIAL COMMENT

"I BELIEVE the ideal home life of today is found where it is dominated by unselfish affection and an idea of helpfulness and fair play. It is a little democracy, the first social group into which the young of the human race comes. Its power for good or ill is almost limitless. It is a training school for all—father, mother, children. If one cannot live in harmony and enjoyment with the members of his family, providing that family is a so-called "normal" one, his chances are small for being able to co-operate happily in other social groups."—LITA BANE.

MAKING FARMING A BUSINESS

Only in recent years have we begun to think of farming as a business. For a long time the farm was just a place where families earned their living and the selling of products was incidental. Making farming a business requires greater work, more careful planning of farm operations, and a deeper insight into the marketing of farm products.

It must be admitted that many who live on the land do not care to work and plan sufficiently to make farming really profitable. This condition of mind and attitude are revealed in many ways. In the early 70's when Wisconsin changed from a wheat growing section to dairying, many farmers left for other states because they would not become dairy farmers or live stock raisers. They did not want to confine themselves the entire year to a regular routine of work.

We met a man a few weeks ago who said he would not slop pigs even though they do return 75 cents a hundred for skimmilk and $1.25 a bushel for corn. This man desires to be a single crop farmer and we do not know of any force that will cause him to take a different attitude. He does not want to work or think to a sufficient extent to make farming a business.

PROVEN SIRES

The cow testing association not only locates the good and the poor cow but will also locate the good and the poor bull. We have not made use of this part of the cow testing association until recently. Last year over 1,000 bulls in cow testing associations became proven sires; that is, sires capable of producing daughters with high records. When inquiry was made concerning them, over 800 had been sold to the butcher.

We must get a keener understanding of the value of the proven sire. The profit between the bull that will sire animals capable of producing 250 to 350 pounds compared to animals that will produce 350 to 450 pounds of fat is tremendous. Of course, the young, unproven bull can not be ignored for he must be used before he can be proven; and old, proven sires pass away. The breeder, however, who desires to make substantial progress in the development of his herd should use the young bull rather lightly until he has shown himself to be a good breeder.

We are fully cognizant of the prejudice against the mature bull which is more or less unruly and difficult to handle. We must submerge our prejudice and lay plans to handle old bulls if we expect to establish breeding upon the proper basis.

On a recent visit to the United States Bureau of Dairy Industry we were shown records of bulls that had increased production and of bulls that had decreased production. Here are the results of two of them: A pure-bred bull was bred to dams that produced on the average 7,890 lbs. milk containing 425 lbs. fat in a year. The daughters of this bull averaged 5,451 lbs. milk containing 315 lbs. fat. The daughters produced 2,439 pounds of milk less and 110 lbs. of fat less than their dams. Another pure-bred bull was bred to dams that averaged 8,521 lbs. milk containing 489 lbs. fat in a year and the daughters of this bull averaged 13,486 lbs. milk containing 675 lbs. fat. This bull increased the production per cow 4,965 lbs. milk and 186 lbs. fat. Doesn't this indicate the necessity of proving a sire before he is extensively used. Of course, consideration should be given to type as we do not believe it is necessary, when procuring high producing animals, to disregard beauty of form. The true breeder will secure both good type and good producing animals.

LAND O' LAKES CREAMERIES

"Six years ago we started out with nothing more than an idea and the determination to do something for the co-operative creamery system of the Northwest. Today the association stands as a success in co-operative marketing with over 400 of the finest creameries in the world as members and with assets and working capital of over $900,000 and located in the finest dairy building in the Northwest. We started with the product of one creamery and in 1926 handled nearly 80,000,000 lbs. of butter."

These statements were made by John Brandt, President of the Land O' Lakes Creameries Inc., during the annual convention of that association. The progress of this association has been unusual and shows what can be accomplished by a body of farmers when they unite with a will to accomplish a certain task.

For years the advantages and benefits to be derived from co-operative marketing had been discussed. Finally the ideas as to how it could be done were crystallized and the science and practice of buttermaking sufficiently advanced to permit the step to be taken. For thirty years the local co-operative creamery had been teaching the lessons of co-operation and creating the sentiment necessary to carry forward an enterprise of such magnitude. Those who are looking for some quick way to solve all the marketing problems of agriculture may well reflect upon the time it has taken the Land O' Lakes Inc. to get started with its splendid program. The accomplishments of the Land O' Lakes would not be what they are without first laying a sound foundation for this organization.

The association may well be proud of the quantity of butter it marketed in 1926 and the wealth it has accumulated, but its greatest accomplishments are the improvements it has made in the quality of Minnesota butter, the establishment of a brand, and extending the market for butter. In the beginning only 32 per cent of the butter made could be sold under a brand but in 1926 over 70 per cent of its butter was sold as Land O' Lakes.

It is well understood by those in charge of this organization that if it is to continue as a necessary agent in marketing butter, quality and uniformity must not be neglected. A laboratory is in constant use and is proving to be one of its most important factors of success. Science, in other words, is giving substantial help to this farm made and farm directed organization. It is discovering what must be done to improve the quality and keeping properties of its butter. Herein lies the most essential factor for permanent success.

COW—HOG—HEN

"Our farms must get away from all cotton production. We have been trying for some years to raise cotton at a loss and pay—out of the 'proceeds'—some $150,000,000 per year for food and feedstuffs for these same farms; food and feedstuffs which can be raised on these farms successfully instead of the cotton which brings the loss.

"The virgin cotton lands of West Texas—millions of acres which have been brought into cotton production or are in process—have a permanent advantage of seven cents per pound over Georgia in cotton raising. That is, these acres in Texas will produce cotton at seven cents less cost per pound than our Georgia acres will produce it. Thus, Texas cotton farmers can make money when cotton is selling at a price which is ruino to Georgia farmers."

These statements are made by the Georgia A sociation which is attempting to increase diver fied farming in Georgia.

"It should be borne in mind: The present loc market in Georgia for eggs and poultry and butt and milk and meat and vegetables (this mark right here at our door) is big enough to abso every pound of butter or meat, every gallon milk or dozen of eggs, every potato or grain corn, which we can produce under our very be efforts in the next ten years."

The Georgia Association is working on plans bring about the production of food and feedstuf It is working out plans for markets, and this cha acter of work we commend for it is the true w to help solve our agricultural problem.

BUILDING BONE

The peculiar value of milk in supplying lime f the building of good bones in young animals w brought to our attention recently through the e perience reported by John Smith, an observi and successful dairyman of Wisconsin. Mr. Smi says that several years ago he had a buyer co to his barn to purchase a pure-bred Holstein bu He was looking for an animal whose dam had good record of production and that was of go conformation. In going over the herd he fou one young bull that pleased him highly and asked Mr. Smith to put a price on him.

As the buyer was a particular friend and go customer, Mr. Smith told him that he preferr not to sell him that particular animal. He sa that, as a calf, the bull refused to drink milk a that he had to put him on a ration of grain wit out any milk. In his own experience he felt th the animal would not develop good strong bor and not only this but would not develop to the si he expected his Holsteins to reach. The buy felt that for some reason Mr. Smith wanted keep that bull for himself and he insisted on ha ing a price set. This Mr. Smith did and the bu was sold.

Now for the sequel to this story:

The buyer returned to the Smith farm so two years later to purchase some more stock. I said that he had turned this bull out into the ya one winter day and that the bull slipped and bro his leg. As he was in charge of a county instit tion, they were prepared to kill their own me and so the bull was killed immediately and cut for meat. Remembering the conversation at t time of his purchase, he took particular pains note the bony structure of the animal. He fou that the bones in this bull, then some three yea old, were no larger than would be found in a s months' calf.

This little experience illustrates that observi farmers get at scientific views before the inves gators give specific reasons. We now have stress very strongly by dietitians that milk is the be source of lime, not only for live stock but f children and other people as well. The lime milk is readily assimilated by the body and buil good bones and good teeth if given an opportuni

Dentists and doctors now emphasize that mu of the trouble experienced by women with th teeth following the birth of children is due to t drain on their systems for lime in building up t bony structure of the child. Much of this can avoided and better children can be produced the mother will eat foods rich in lime and, pecially, drink milk. These investigators also fi in their practice that children who do not dri milk are more subject to poor teeth than a those children who have a plentiful supply milk. The next time you go to your dentist, jt ask him what his experience has been with po teeth in children. He will doubtless tell you th the specialists recommend milk in every instan where he has referred to them children wh teeth are going bad and where his work as dentist has been without avail.

Cheese Yield of Milk

How many pounds cheese can be made from one ndred pounds of milk? What was the price of eese in Wisconsin in 1926?
Seymour, Wis. G. W.

It is estimated that a pound of fat in milk on e average will produce about 2.65 lbs. of cheese. e lower testing milk will produce slightly more unds cheese per pound fat, however, than will e higher testing milk. It is estimated that 100 . of 3 per cent milk will produce 8.3 lbs. cheese compared with 10.6 lbs. for 4 per cent milk, .9 lbs. for 5 per cent milk, and from 14.5 to 15 . for 6 per cent milk.

The average wholesale prices of cheese on the isconsin boards were as follows for 1926: Single isies, 21.8c; Twins, 21.1c; Squares, 22.6c.

Holding Whipped Cream

I deliver my raw cream to a restaurant owner for ipping. He claims it whips all right, but it does t stand up and he has to rewhip it several times lay. The cream tests 33 per cent and we deliver when a day old. My competitor pasteurizes and es his cream before delivery.
Klamath Falls, Ore. B. B. R.

The immediate concern appears to be the stand-g-up quality of the cream after being whipped. e see no reason why the pasteurized cream ould be superior in this respect to the raw cream less it originally produced a stiffer whip. This uld be rather contrary to general experience as has been found that under most conditions raw eam will produce a better and stiffer whip than ll pasteurized cream of the same general quality.

There are three important and closely related ctors affecting the standing-up quality of whip-g cream. These are temperature, the stiffness the original whip, and the butterfat content of e cream. If whipped cream could be kept at or ow 50 degrees Fahrenheit it would continue to nd up for several days. If it is not held under a sonable cold temperature, the stiffness of the ip will decrease or vary according to the in-ase in temperature or the stiffness of the whip. though an increase of butterfat content beyond per cent does not increase the stiffness of the ginal whip, it does aid the whip to stand up for onger time and at a higher temperature than if e cream is relatively low in butterfat content.

The standing-up quality of whipping cream may very materially decreased if sugar has been xed with it. It is preferable to add the sugar t prior to use even though it may be somewhat re difficult to distribute it evenly through the am.

Sweet Clover as a Fertilizer

For the purpose of improving the land we fur-hed a tenant with sweet clover seed which he ved with his small grains in the spring of 1924. the fall he pastured the young clover and next mmer cut the hay. The following spring he ain seeded to small grain, which was harvested usual, but the yield did not come up to expecta-ns, in fact, showed no increase. The tenant's ex-ience was that of his neighbors.

Now, we are extremely anxious to increase the tility of the land—a crying need over a wide etch of country—and we had thought to do this means of sweet clover, but we do not seem to ve hit a successful way of doing it.
Hopkins, Minn. A. H.

We are not greatly surprised that as it was han-d the sweet clover failed to increase the yield the small grain which followed it. It is one of e cases in which a man cannot eat his cake and ve it, too. Apparently, all of the sweet clover owth was eaten by the cows and was not left to w under and thereby increase the nitrogen con-t of the soil and improve its physical structure. While it is quite possible that the sweet clover ots may add something to the nitrogen content the soil and improve its texture, yet it is doubt-whether this would show up sufficiently to be iceable. It would seem that the tenant should satisfied with the results, because he has se-ed both hay and pasture from the seeding of sweet clover. This is probably more than he uld have secured if no sweet clover had been ded with his grain crop in the spring of 1924.

t is our own practice to seed sweet clover at the e of about 10 pounds per acre in practically all our small grain. We use the sweet clover pri-rily as a green manure crop and do not pasture because of the inconvenient access to most of se fields. While we do not have any definite rec-ords, we estimate that by plowing the sweet clover under in the spring of the next year we secure a result equivalent to a light dressing of manure. Of course, there is nothing except nitrogen added through the growth of the sweet clover, but it puts the ground in excellent condition for the succeeding corn crop. We seldom follow sweet clover with grain because under our rotation corn follows after the grain crop and, in addition, there is some danger of the sweet clover becoming something of a weed in the grain where grain follows grain. This same condition exists to some extent with the corn, but because of cultivation and because the corn is largely used for silage, the growth of volunteer sweet clover is not a detriment.

Off Flavored Milk

We are wondering if you may not give us some assistance in regard to eliminating the cause of off flavored milk. Our milking herd is composed of one hundred and thirty Holstein cows and the milk is sold as grade A Raw. A milking machine is used and from there the milk is strained and dumped into a copper tank which has been tinned. From here the milk is forced with an aluminum centrifugal pump through sanitary pipe over a tubular cooler and then into the bottling machine by gravity.

We have repeatedly taken individual samples of each cow's milk as it comes from the milking machine and are unable to find any trace of this particular flavor there. And likewise we have taken it at different steps in our system of handling the milk without detecting it until it comes off of the cooler. This leads us to thinking that there is something about the cooler that is causing it.

This flavor does not show up in the milk from all of the cows but only from a very few. We may find it in one cow's milk for several days and then all of a sudden it will disappear and probably come back in a day or two or maybe it will develop in some other cow's milk after going over the cooler. It has, however, showed more frequently in one of our two-year-old heifers. Never have we been able to detect it until after it goes over the cooler. It also takes time for this off flavor to develop. Usually it cannot be detected until twelve or fifteen hours old. Our milking machine and all of the pipes are taken apart and thoroughly washed after each milking and then sterilized with live steam. Everything is in a clean and sanitary condition.

Last summer we used for a few days an iron pump for forcing the milk over the cooler and we got a flavor and odor that resembled the trouble that we are now having very much only this was in all of the milk that went over both the iron pump and the cooler. Neither one alone seemed to have any ill effect on the milk. After we did away with this pump we only had the trouble to pop up now and then as I have explained before.
Basehor, Kans. G. G. M.

Professor W. D. Frost, bacteriologist at the Wisconsin College of Agriculture, has given us the following reply to this inquiry:

"From what is said in the letter, the trouble is probably bacterial because of the time which elapses between the milking and the appearance of the off flavor. The only effect which the pump or cooler might have is the possibility the air which would be introduced in these ways may be necessary for the development of the particular bacterium causing the trouble. Would it not be worth while to milk certain suspected cows into thoroughly sterilized bottles. Fill one bottle full and cap it, another partly full and cap it. Set these away for the necessary incubation period at a temperature which will produce this flavor. Fill a third bottle partly full, cap and shake in order to introduce air and set aside with the others.

"If the trouble is caused by bacteria a bacteriologist will probably be necessary to locate the source of the germ.

"It goes without saying that if the trouble is in the cows' udders, the offending cows will have to be located and removed from the herd. There is still the possibility that the source of the trouble may be outside of the cow and it would seem to me to be very desirable to give everything that the milk comes in contact with a thorough treatment with live steam for an hour or so, and with a sodium hypochlorite solution—this means cans, bottles, milk machines and pipes, and apparatus of all kinds."

To supplement what Doctor Frost has said it appears to us that the cooler may well be put under suspicion. It is possible that the tinning has become worn in some spot on the cooler and that the off-flavored milk may be due to the absorption of some mineral from the cooler. It is possible, also, that there may be a leak somewhere in this cooler that is causing the trouble with the milk. It would be well to examine the cooler very carefully. Make the test suggested by Mr. Frost of the milk coming from different parts of the cooler and of the milk bottled directly from the cooler and that which has been permitted to stand in the milk room before the bottle is covered. There is a possibility that there may be some contamination of the air in the milk room.

A Retail Milk Problem

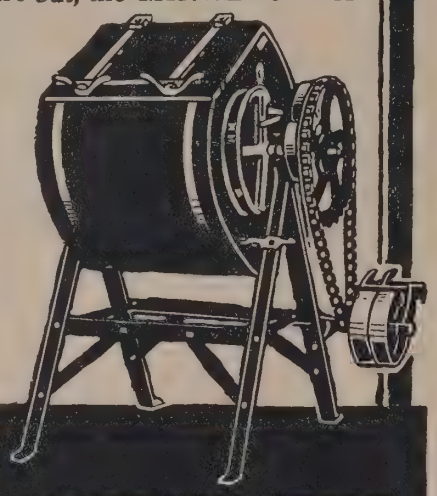
There are three of us producing and retailing Grade A milk. We desire to combine our work to reduce expense and take in with us a fourth man as general distributing agent. What would you consider a fair price to pay this agent when he has to retail at 15 cents a quart?
Muskogee, Okla. R. R. S.

Mr. Ernest Kelly of the U. S. Bureau of Dairy Industry has given us the following reply to this inquiry:

It is impossible to give any figures on this subject which would be just to all concerned. Local conditions such as the price of labor, horse keep, amount of milk handled, etc., would be important factors in setting a definite margin.

I judge that at the beginning the delivery man will handle about 250 gallons of milk. I am also assuming, for the purpose of estimating, that the three dairies will furnish the bottles and stand all bottle losses and that the delivery man will simply take care of the actual delivery, the collection of empty bottles, the collection of accounts, and assume any bad debts. Another factor which makes it difficult to estimate the margin is the proportion of wholesale to retail trade. If the trade were to be largely retail at 15 cents a quart, the proposition would be quite different than if there were a large proportion of wholesale milk in bulk.

In 1919 the U. S. Bureau of Agricultural Economics compiled some figures on the cost of conducting a milk business in the Midwest. They found that each quart of milk delivered to the consumer cost 14.7 cents. Of this amount 2.2 cents were spent for delivery and selling, and .7 cent was spent for general and administrative costs. There are undoubtedly other costs which should be allocated to the delivery, and I should estimate that at that time and in the localities studied the actual cost of delivery was approximately 3½ cents per quart or a little over. Of course, costs have advanced somewhat since that time, and the figures given allow for no profit on conducting the delivery end of the business. Some plants were able to operate at considerably less cost and others ran a great deal higher. The extreme variation for delivery expense was from 1.2 cents per quart to 4 cents per quart—so that it may be plainly seen that the efficiency of the system and the local costs for labor and other items made a difference of over 300 per cent. Adding ½ cent a quart to the approximate cost of delivery for the profit of the delivery man would make the margin a little over 4 cents a quart. This, however, would only give the delivery man $5 a day for his actual labor, based on 250 gallons of milk a day. Of course, some of his skill would be covered in the item of administrative expense, which would amount to over $6 a day on the basis of 250 gallons.



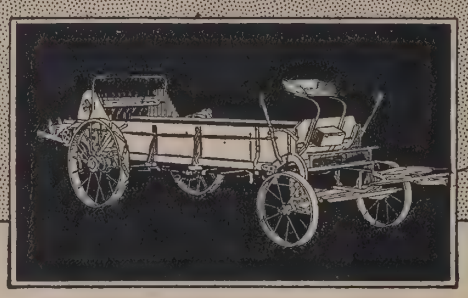
I have no figures on a proposition exactly similar to the one outlined. I know of one dairy that is handling special grade milk for two farmers. These farmers bottle the milk, but the retailer furnishes the bottles. The distributor also hauls the milk to his plant, charging 4 cents a gallon for hauling. The differential charged by this distributor, eliminating the item of hauling and bottles, is from 4½ to 6½ cents a quart. Of course this distributor has a business already established where his own wagons cover a large part of the city. This would tend to lessen the cost of distribution of the special grade of milk as it would be carried on the regular delivery wagons. However, the labor costs and the cost of maintaining delivery rigs are probably higher in the city I have in mind than they would be in Muskogee.

It seems to me that this whole matter is one that should be tried out before a definite contract is made for any length of time. There should be the fullest co-operation and the greatest degree of frankness between the parties concerned regarding costs and profits. It might be that a start could be made on a basis of 9 or 10 cents a quart to the producer, leaving 5 to 6 cents a quart for the retailer. A two months' trial of this scheme would indicate whether or not this is a proper adjustment.

MINNETONNA
HOME BUTTER MAKER

A WONDERFULLY efficient butter making machine built on the same working principles as the machines used in large creameries, differing only in size and price.

It gets all the butterfat out of the cream. It churns rapidly so the butter comes in from one-half to one-fourth of the time. By simply throwing in clean water and giving a few turns, you remove all buttermilk. Instead of working the moisture *out*, the MINNETONNA works the moisture *in*, so necessary to the flavor and the keeping qualities, and giving an "over-run" (of moisture and salt) of from 20 to 25 per cent above butterfat test. Hence *more* and *better* butter.



Churning capacity 3 to 12 gallons. Working capacity 3 to 20 lbs. Larger sizes up to 100 lbs. capacity.

CHURNS THE BUTTER AND WORKS IT.

BUSINESS THE E-B LINE FOUNDED 1852

Count the cost you won't have

Just as sure as you investigate the upkeep cost of spreaders you'll decide that an Emerson-Brantingham is what you want. Get all the figures. Then this fact will stick in your mind—the average upkeep cost per year for 30,000 E-B Spreaders was $1.03 per spreader! We know the exact figure because we make the repair parts—and we make mighty few.

On top of economy of operation is ease of operation. The E-B Spreader spreads seven feet wide. Consequently it travels little more than half the distance other spreaders must travel to cover the same area. It turns a square corner, drives through a six foot door, and the tight bottom prevents loss of liquid manure. The 41-inch height makes loading easy. Mail the coupon for full description of this spreader or any other implement in the E-B line—economy is the watchword of the E-B farmer.

What Can You Afford to Pay?

A Story of What Four Years' Cow Testing Association Work Meant to an Iowa Dairyman

ONE of the best endorsements of cow testing association work that we have ever heard came from Henry C. Vaske of Dubuque County, Iowa. This endorsement was not just an opinion of Mr. Vaske but it was supported by the record books covering four years' membership in a testing association.

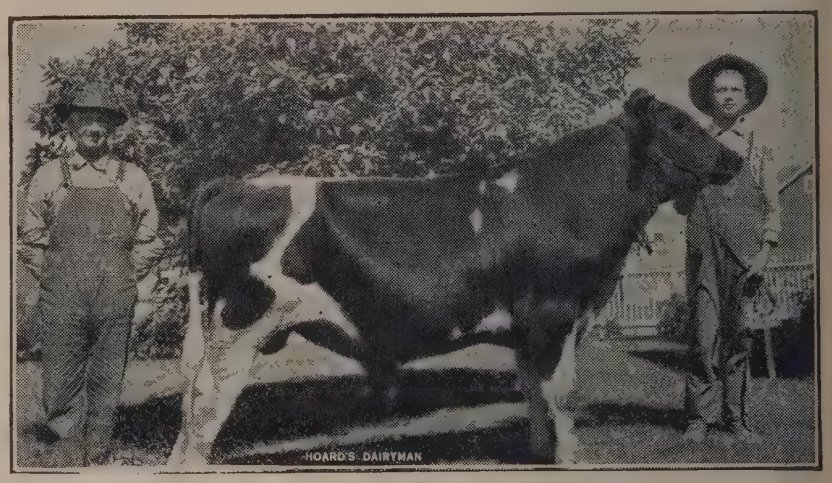
We had gone to Mr. Vaske's farm for an interview on the recommendation of him to us by County Agent Frank R. Kerrigan.

We told Mr. Kerrigan before starting out from Dubuque what kind of dairymen we wished to visit. We wanted men whose cows and good management combined with good farming are making satisfactory returns on the labor and capital invested. Kerrigan took us up to see Mr. Vaske.

During the interview we asked Mr. Vaske one question, among many, the answer to which is the basis for saying that he gave a very good endorsement to cow testing association work. The question asked is as follows: How much can a dairyman, who milks 15 cows, afford to pay as an annual fee for membership in cow testing association work and still make a profit on the investment provided he makes use of the information made available through and because of this work?

"He can pay $10 per cow per year," said Mr. Vaske. Continuing he said, "My books for four years' work show that I could have paid this much and still be ahead several dollars per cow. You may take the books with you, if you like, and figure it out for yourself."

We took the books and later figured out what cow testing association work did for this dairyman as measured in pounds of butterfat and money in the bank.



Mr. Vaske milked 21 cows the first and 28 cows the second year that the herd was in the association. The total production for these 48 cows for the two-year period was 248,622 lbs. of milk and 8,388.9 lbs. of butterfat, or an average production of 5,179 lbs. of milk and 174.7 lbs. fat per cow.

The third year Mr. Vaske milked 21 cows and the same number the fourth year. These 42 cows produced 313,500 lbs. of milk and 11,087.8 lbs. of butterfat, or an average annual production of 7,464 lbs. of milk and 264 lbs. of butterfat per cow.

The average annual butterfat production per cow the first two years was 174.7 lbs., and for the last two years this was 264 lbs., or an annual increase of 89.3 lbs. per cow for th two-year period.

Mr. Vaske said he could pay $1 per cow per year and still make a goo profit on the investment. Let us tak him at his word and charge each co $10 per year for the four-year perio or $40. Let us now go to the recor books and find out how much prof Mr. Vaske made on his investment.

The average annual cost of feed pe cow for the first two-year period wa $45.09. With butterfat at 45 cents pe pound the return above feed cost wa $33.52 per cow. The average annua cost of feed for the second two-yea period was $8.69 more or $53.78 pe cow. With butterfat at the same pric as figured before, the return abov feed cost was $65.02 per cow. Th increase per year as valued in dolla is $31.50 per cow and for the two-yea period this is $63.00. After havin paid for more feed value and after de ducting the $40 for each cow's mem

Mr. Vaske believes in using good bulls. At the age of 14, Clarence Vaske, the son, is rapidly learning the important things in dairy cattle management through junior club work and the encouragement of his father.

bership in the association, there is sti $23 to be disposed of. It seems th Mr. Vaske is entitled to this for ha ing put into practice the informatio gained through testing associatio work.

Mr. Vaske has been on this far 29 years. He came into his far partly by inheritance but he had improve the farm adding all the buil ings. He had to bring the land unde cultivation. He has done a migh good job of all of this. He is a goo farmer.

We asked him how long he has ha

This flock of White Wyandottes returned a gross income of $953.76 last year for Mrs. Vaske and her two daughters. The youngest daughter, Lucina, is here shown scattering the grain mix.

olsteins. "Twenty-nine years," he plied. "We originally had Short-rn cows and bought a Holstein bull. still remember some of the cross ed calves that were blue in color." Here is a man who started with olsteins 29 years ago. His herd just

nt into the testing association in 19 and 21 cows averaged 168.5 lbs. tterfat. His best cow that year ade 285.8 lbs. butterfat. In the 1922 23 testing year 21 cows averaged 5.6 lbs. fat and his best cow made 5 lbs. fat. In 1923—24 his 21 cows eraged 242.3 lbs. fat and his best w made 453.1 lbs. fat.

The first year in C. T. A. work his st cow produced 34.4 lbs. of milk a y. At the present time Mr. Vaske d he wouldn't consider a first calf fer good enough to keep for breed-purposes unless she produced re than 34 lbs. of milk daily.

On the wall in the dining room in Vaske home is a certificate of rit signed by H. E. Van Norman l awarded by the National Dairy sociation for a herd averaging 300 more pounds of butterfat consider-full time lactation cows. Then re is a certificate by the Bureau of imal Industry stating that Mr. ske's herd is free from tuberculosis l is accredited. There is also a cer-ate of membership in the Holstein-esian Association of America, also ertificate for membership in the a Holstein Breeders' Association. her certificates of importance ong this exhibit are 3 indicating nbership in calf club work for all the junior members of the Vaske ily. All of these are neatly ned. It is rather unusual to find nany of like character in one farm ie.

Mr. Vaske sells 2 carloads of hogs a year. Then there is a fine flock pure-bred white Wyandotte chick-that bring in more money each than some folks make from their s. We asked Mr. Vaske what he with the chicken money and he that he didn't see much of it. On top of this he said that Mrs. Vaske the two daughters knew how to di-the skimmilk to the disadvantage is pigs. No wonder the chickens e a lot of money.

here is nothing unusual about Mr. ke's farming. He uses, quite ely, the standard corn belt rota-of corn, corn, oats, and clover. He soy beans in the corn for silage. has learned how to use manure to advantage. He keeps the weeds n.

here seems to be some correlation een a good producing herd of cows and growing alfalfa. Several times this season we have come across dairymen who started growing alfalfa after the herd average got up around 300 lbs. fat. This is true with Vaske. He is just getting well started with alfalfa. The year before he made his first seeding of alfalfa he bought a carload of alfalfa hay. Perhaps this had something to do with getting him in the notion to grow his own.

He considers regularity in feeding and milking, good care, and a good bull about of equal importance in success with the herd. Vaske is strong for a good bull. He has one bull, Iowana Rollingdale Waldorf, 8 years old, that he wants to keep as long as the bull lives. The cow testing association told him what this bull is worth. The present junior herd bull, Hengerveldt, is being mated to the females from the old bull.

The junior member of the Vaske family, at his father's direction, led the young bull out for our inspection and to be photographed. The boy is 12 years old and we predict that he will grow rapidly in knowledge of practical dairying as he grows in years. His father is giving him an opportunity to learn the business.

Mr. Vaske shows some Holsteins every year at the county fair. He helps with the dairy calf club work. The county agent told us that New Wine township was almost in the cellar position in farm bureau membership a year ago. Vaske was elected director and the first thing he did was to put the membership up to 65.

With all the certificates on the wall of the dining room and with public service performance like this, it isn't any wonder that Mr. and Mrs. Vaske are making money from Holsteins, hogs, and poultry.

The Goat

A schoolboy's essay: "A goat is about as big as a sheep if the sheep is big enough. A female goat is called a buttress; a little goat is called a goatee. Goats are very useful for eating up things. A goat will eat up more things than any animal that ain't a goat. My father had a goat once. My father is an awful good man. Everything he says is so, even if it ain't so. That is all I know about the goats."—The Boston Transcript.

We can't reach old age by another man's road.—MARK TWAIN.

Healthy curiosity and a McCormick-Deering 10-20 tractor. Here are power farmers of the future.

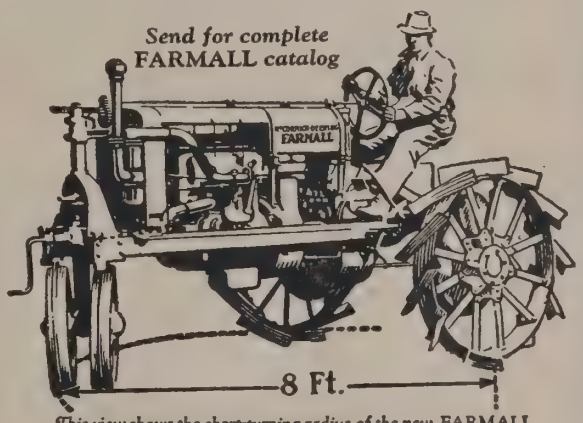
McCormick-Deering Tractors

The standard farm power, made in two sizes, 10-20 h. p. for 2 plows, and 15-30 h. p. for 3 plows. Fully equipped 4-cylinder tractors with ample power at belt, drawbar, and power take-off. Thousands upon thousands of successful farmers rely on McCormick-Deering Tractors to keep down the costs of farming.

The Young Generation *and* the Tractor

A FEW years ago only a handful of tractors in the land—today over a half million! The children of today are growing up in the power farming age. The McCormick-Deering Tractor in the field, the family automobile on the road—and life on the farm holds more *living* than ever before.

Necessity and the *spirit of youth* have brought about great changes on the farms. The young farmer and the older farmer who keeps his mind young are working on the new and profitable scale. They are making money by handling the most productive work in the least time with the lowest labor costs. They are increasing per-acre yields—plowing more furrows per trip—planting every hill full—cultivating more rows—cutting wider swaths. They are beating down the high price of labor by making that labor do two and three days' work in one, and that method leads to farm profit.



The tractorless farmer is working against fearful odds these days—against the fast, productive work of six hundred thousand tractors. This spring more of the high-quality tractors—McCormick-Deering 10-20, 15-30 and FARMALL—are going from the McCormick-Deering dealers to work on the farms than in any previous spring.

INTERNATIONAL HARVESTER COMPANY

THE FARMALL

The remarkable new 4-cylinder McCormick-Deering FARMALL, designed to handle planting and cultivating of row crops, as well as all other farm power work. With a 2-row planter the FARMALL covers 25 to 30 acres a day; with a 4-row planter 50 acres a day. Equipped with cultivating attachment, FARMALL cultivates 15 to 25 acres a day, doing the work of 2 or 3 men and 6 to 8 horses. In all haying operations, too, nothing can beat FARMALL. With the 7-ft. mowing attachment and one 7-ft. trailer mower you can cut 50 to 60 acres a day.

This view shows the short-turning radius of the new FARMALL

Almost time for *repainting*

WHEN repainting time comes along, farmers who are careful managers will paint white or light colors with Eagle Pure White Lead in Oil. We recommend that you employ a good painter. When you do, be careful that he adheres to the following specifications:

For outside repainting use these proportions

FIRST COAT

100 *pounds* EAGLE *White Lead*
1½-2 *gallons pure raw linseed oil*
2½-2 *gallons pure turpentine*
1-1½ *pints best Japan drier*

6½ *gallons pure white lead paint*

SECOND COAT

100 *pounds* EAGLE *White Lead*
3½-4 *gallons pure raw linseed oil*
½-1 *pint pure turpentine*
1 *pint best Japan drier*

6½-7 *gallons pure white lead paint*

Valuable information on the preparation and painting of all kinds of surfaces is given in the "Tinting and Mixing Chart." Write for your free copy today. *The Eagle-Picher Lead Company, 134 North La Salle Street—Chicago.*

Cow Testing Associations in the United States

There are several interesting changes in the cow testing association line-up this year.

Wisconsin still has the largest number of associations followed by Michigan, Minnesota, Iowa, and Pennsylvania, in the order named.

The honor of having the largest number of cows on test in these associations also goes to Wisconsin. This state has had this distinction for a number of years. California with an increase of 11,008 cows on test is rapidly reducing this lead. California is the second state in number of cows on test, with Iowa third, Minnesota fourth, and Michigan fifth. California has 10 per cent of its dairy cows on test, Nevada is next with 7.2%, and New Jersey next with 4.7%.

For the United States as a whole, the number of associations has increased from 777 last year to 837 on January 1, 1927. This is a gain of 7.7 per cent. The number of members has increased from 19,540 to 21,128, a gain of 8.1 per cent. The number of cows on test has increased from 327,653 to 362,014, a gain of 10.5 per cent.

We are pleased to welcome back into the list of states having active cow testing associations the following: Kentucky with two associations; Louisiana, Alabama, Georgia, and Texas, with one each.—U. S. Bureau of Dairy Industry.

Clean Milking

HOARD'S DAIRYMAN:—Don't rush or rush your help so fast that your cows are not properly milked.

I saw a poor job of milking being done and sat down to remilk the cow. At that one milking I got eight-tenths of a pound milk, or the equivalent of 1.6 pounds per day. This would amount to 48 pounds for one month, or 432 pounds for the average nine months in milk. This milk tested 11 per cent fat, indicating a total probable loss of 47.5 pounds fat for this cow's yearly milking period.

Not considering the effect of the incomplete milking on drying up the cows, which would doubtless mean an even greater loss in production, this 47.5 pounds fat at 50 cents a pound represents $23.75 that the owner would have received in a year if this cow had been milked dry.

I have tested the last drawn milk from three cows and compared it with the average test of all their milk for the day, with the following results:

Cow's name	Average test	Stripping test
Julen	4.0%	10.5%
Fern	4.5%	10.0%
Bettie	4.4%	8.2%

W. N. CHRISTENSEN, Tester.
Minnesota.

Profits and Costs Greater

HOARD'S DAIRYMAN:—The second testing year for the S. Newaygo Association of Michigan has ended with an average production of 36 pounds fat higher than last year. Although the returns per dollar expended for feed were 25 cents less, the milk cost 33 cents per hundred more, and the feed cost per cow greater, the total profit per cow above feed cost on butterfat alone was $16 greater than last year. Thus the members received market price for the extra grain by feeding it to their cows and received $16 extra profit on top of that, plus the value of the extra skimmilk.

The high herd owned by Schipper Bros. had an average production of 435 pounds fat, compared with an average of 260 pounds in 1923 and 362 pounds in 1925. In the same time the profit per cow has increased from $71.60 in 1923 to $103 in 1925 to $110 this past year. This is a very good example of the value of continued testing.

Schipper Bros. say that for years they milked cows and the year they milked no more than first year. After three and one-years of C. T. A. work their production has increased over 3,100 pounds milk and 175 pounds butterfat cow. Their reason for this is they sold three boarder cows and according to production.

In every case where the herd been fed a balanced ration according to production, the increased profit more than paid the testing costs.

CLARENCE PRENTICE, Teste

Effect of Condition on Production

HOARD'S DAIRYMAN:—The effect of the condition of cows when they come into the barn in the fall is strikingly shown in the herd of E. C. Rasmussen of the Denmark, Wis., Association. When I first visited this farm in December, 1924, its first year in the association, I noticed the cows were in poor condition. The next year they were in much better condition, due to getting grain sooner in the fall, better fall pasture, and to more individual attention given each cow.

The following is the record of the herd for the six winter months, December 1st to May 31st of the two years in the association:

Winter 6 mos.	No. of cows	Average Per Cow Fat	Value	Feed cost	
		Lbs.			
1st period	14.7	96.3	$52.98	$31.54	$1.4
2nd period	16.7	146.5	80.60	40.36	.2
Increase		50.2	$27.62	$ 8.82	$1.8

This herd increased its average production by 50 pounds for the second period of six winter months more than eight pounds per month. This was more than enough to offset the added feed cost of $8.82 and return a larger profit per cow of $1.30. The better care and attention inspired by cow testing work produced Mr. Rasmussen $314 more profit the second period of six winter months.

The prices used for fat were the same both years, and there was very little difference in prices of feed. The roughage for both years was of the same quality and the grain mixture used contained the same per cent of protein, the grain being fed at the rate of one pound grain to four pounds milk both years. There was very little difference in freshening dates.

The only difference that I could see was that due to the better feeding that took place the first year in the association the cows were in better condition and were able to produce better the second year.

THE DE LAVAL MILKER IS SIMPLE AND EASY TO OPERATE

Facts about the De Laval Milker

1. **650,000** cows now milked the De Laval Way.
2. De Laval Milkers now in their eleventh year of use.
3. **83.27%** of the users report average saving of 2 hrs., 12 mins. per day—saves half the time in milking.*
4. **97.13%** of the users say it agrees with their cows.*
5. **99.4%** of the users say they get as much or more milk with the De Laval as by hand milking.*
6. **9.49%** average increase in production per cow is reported by those who claim the De Laval Milker increases production.*
7. **94.80%** of De Laval users say their milker is easy to keep in a clean and sanitary condition.*
8. Average bacteria count of all reporting, 14,542—**62%** report counts of 10,000 and less.*
9. **96.45%** of De Laval users say their milker is "the best," "one of the best," or a "good" investment, as compared with other farm equipment they own.*

*Based on reports from 1844 De Laval Milker users in all parts of the U. S. and Canada.

The De Laval Separator Co.

NEW YORK
165 Broadway

CHICAGO

"He is the happiest, be he king or peasant, who finds peace in his home."—GOETHE.

Feeding Sprouted Oats

During the past year in the Beltsville herd of the Bureau of Dairy Industry, eleven animals that had given trouble in breeding became pregnant after sprouted oats were fed. These animals had not conceived after having been bred a number of times, but upon examination of the genital organs they showed no abnormal condition, pathological or otherwise, that would prevent conception. Only those animals that appeared normal were used in the experiment. Seven of these were cows that had bred without results for periods of six to fourteen months. Three of these seven cows were over eight years of age. The four remaining animals were heifers that had been bred a number of times with no conceptions.

In addition to the eleven animals, seven heifers were fed sprouted oats before being bred. Four of these conceived to first service, and the others required two, three, and four services respectively for initial conception, making an average of less than two services per conception. Apparently sprouted oats correct a nutritive deficiency. We believe success is due to the presence of vitamin E in the sprouted oats.

The stage of growth at which sprouted oats is most effective has not yet been determined. Experiments are being made with oats having sprouts two to two and one-half inches long and also with oats just germinating. Although the experiments with the oats that have barely sprouted have not gone far, it seems that the feeding of these oats will be effective in correcting sterility.

To produce green sprouts two to three inches long, the desired amount of dry oats should be placed in a sack and soaked for twenty-four hours in a tub or barrel of water to which a small amount of formalin, one ounce of formalin to fifty gallons of water, has been added for the purpose of preventing mold. The oats should remain in the sack on the floor for forty-eight hours, after which they should be placed in the pans or trays of an ordinary sprouter, such as is sold by poultry supply houses. The temperature should be maintained at about 75° to 80° F. If long growth is desired the oats should be left in the pans five days. If less growth is desired they may be fed sooner. The oats can also be sprouted by placing the dry oats in a perforated drum, soaking them in water for twelve hours, and then placing the drum on a rack for four days. The oats will then be matted together with numerous small white roots and the sprouts will protrude from the grain sufficiently to be seen. Cattle appear to relish the oats that have just sprouted more than those with the long green sprouts. During the sprouting period, the oats must be kept moist, care being taken to prevent too much moisture at one place and drying out at another.

The equivalent of five pounds of dry oats per day is fed, and conception has occurred after a feeding period averaging approximately sixty days. Five pounds of dry oats is the equivalent of thirteen to fifteen pounds of the sprouted oats. The roots, sprouts, and germs are all fed. It has been the plan at Beltsville to substitute the oats for an equivalent weight of silage in the ration. Most of the animals receiving the oats were on dry feed.

Sprouted oats assist also in maintaining to an advanced age the fertility of the herd sire.

The fact should be emphasized that the feeding of sprouted oats is likely to correct only functional conditions. Before feeding sprouted oats care should be taken to remove any pathological causes that may prevent conception. For the most part, in the experiments at Beltsville, favorable results from sprouted-oats feeding have been secured from animals in which a thorough physical examination has shown no reason for their not conceiving.

This office will appreciate receiving the results obtained from feeding sprouted oats.—R. R. GRAVES and FRED W. MILLER.

Debating for Farm Folks

"Why not have a debate?" is the question asked by J. H. Kolb and A. F. Wileden in a challenging circular recently issued by the Wisconsin College of Agriculture.

For training leadership, furnishing interesting programs for farmers' organizations, giving farmers and their families a chance to discuss important public questions, the debate is excellent. Both those who take part and those who listen gain a great deal if the question is well chosen.

"A debate may be easily planned," say Kolb and Wileden. "Each team consists of either two or three debaters. Speeches should be limited to five or ten minutes with a short rebuttal for each speaker. It is customary for the affirmative to start the debate, and for an affirmative speaker to have the last rebuttal. A chairman should preside and announce the speakers. There should also be a timekeeper."

Plan your debate carefully, assign distinct points to each speaker, don't try to prove too many points in one speech, use only sound argument and clear summaries at the close of each speech, advise Kolb and Wileden. Valuable suggestions can often be secured from clergymen, teachers, lawyers, county officials, and officers of farm organizations.

The debate may be judged by three persons acceptable to both sides; it may be judged by just one person; or the people in the audience may express their opinion by ballot.

Several good questions for debate are suggested in the circular. Here are a few: 1. Resolved, That all the rural territory in our state should be in a legal high school district. 2. Resolved, That the basis of taxation for state revenue should be income rather than property. 3. Resolved, That more efficient productive methods should not be developed without first developing better marketing facilities. 4. Resolved, That a private marketing system has done m for our state than has a co-operat marketing system. 5. Resolved, T this community should set as every Saturday afternoon for purpose of organized recreation. Resolved, That modern convenien should be secured for the farm ho before they are installed on the fa 7. Resolved, That the drift of po lation from the country to the c has not thus far been a detriment agriculture in our state. 8. Resolv That the farmer who operates a tr tor and uses horses on his farm make larger profits than the far who uses horses alone.

Loan packages of debate mate on most of these questions can obtained for return postage from University Extension Division, partment of Debating and Public cussion, Madison, Wisconsin.

When the Robin Sings i the Apple Tree

When the robin sings in the apple tree
There's a fullness of joy in his melody,
Awakening dreams of a rosy hue
Drowsing deep down in the heart of you,
Bringing sweet visions of joy to be
As he sings in the spring in the apple tre

He does not sing for the world's applaud
Nor wait for the critics to frown or lau
But pours his heart from his tiny thro
With never a thought nor a care for not
"The morning's fine and the spring is he
And isn't that reason enough for chee
So he sits high up where the world may
And sings and sings in the apple tree.

There's a snug little nest in a branch close
Where lovely blue eggs 'neath a warm br
lie;
A gay little home and a mate's true lo
Are the very best things that a robin kn
of,
So he tries to express all the joy he f
As the dawn's soft light o'er the hushed e
steals,
In a rollicking, rapturous, ringing key
As he sings and swings in the apple tre

Oh, beautiful bird with your burning bre
Who taught you to sing as a bird knows b
Was it the sun as it said goodbye,
A fairy, a flower, or butterfly?
Maybe, who knows, 'twas a zephyr, bri
Kissing your throat as she said goodnigh
But then, ah, then, as it seems to me
'Twas the gay little home in the apple t

(Copyright 1927). —I. A. KIMBL

"Strange," said Billie Ritchie, in a musing mood, "we very seldom rea our boyhood dreams."

"Oh, I don't know," replied Al Fairbairn. "When I was a kid I dreamed of the day I would w long pants. And now I wear th longer than I ever dreamed of."

ATTRACTIVE FARM HOME OF M. S. ALEXANDER, MINNESOTA

Right Methods of Milking

H. A. BEREMAN, SOUTH DAKOTA

THE successful dairyman will "treat a cow as though she were a lady." This is not sentimental slush but a matter of dollars and cents. Every dairy farmer who owns one cow or a hundred can increase his milk check by learning right methods of milking. Out of many years' experience the following suggestions are made. It is believed that their adoption will be followed by better quality and a greater flow of milk—both of which mean more money for the milker. It might even mean the difference between success and failure.

The art of milking consists in doing the job comfortably, keeping the cows in good condition, and getting the highest possible yield of rich milk from each cow.

The expert milker is even-tempered and not easily provoked. He plays along with his domestic animals by gentling them. As lactation is a nervous function, any disturbance of the cow's bodily comfort results in a shortage of the yield. The contented cow is the profitable cow—other factors being equal.

Regularity in milking is important. The cow is a creature of habit. If her meals are delayed she frets and takes it out on her owner by giving less milk. She will do better if she is milked at the same hour every day. My experience, covering many years as a practical dairyman, shows that it is best to feed after milking. The cows stand more quietly, usually chewing the cud, and there is less dust in the air to contaminate the milk. Scientists declare that most of the milk is elaborated during the milking process. Hence, a liberal supply of blood should flow through the udder at that time. The excitement of being fed draws the blood away from the udder and may lower the yield.

A comfortable milking stool makes the work easier. The stalls should be kept clean. The use of a closed pail having a top fitted with a removable wire-gauze strainer, into which is packed sterilized absorbent cotton, helps in the production of good flavored sanitary milk. The writer used this method as an original device as early as 1897, and it is now used by virtually all high class dairies where "certified" milk is produced.

The farmer who desires a clean product that will keep well and make the best flavored butter, cheese, and market milk, will wash the teats, udders, and flanks of his cows before milking. Dirt is not only disgusting but expensive and dangerous. Sometimes it contains disease germs that are a menace to the health of the family and the public. The hands should be kept clean, the nails trimmed short, and the filthy habit of wetting the hands with milk should be condemned by all decent dairy farmers.

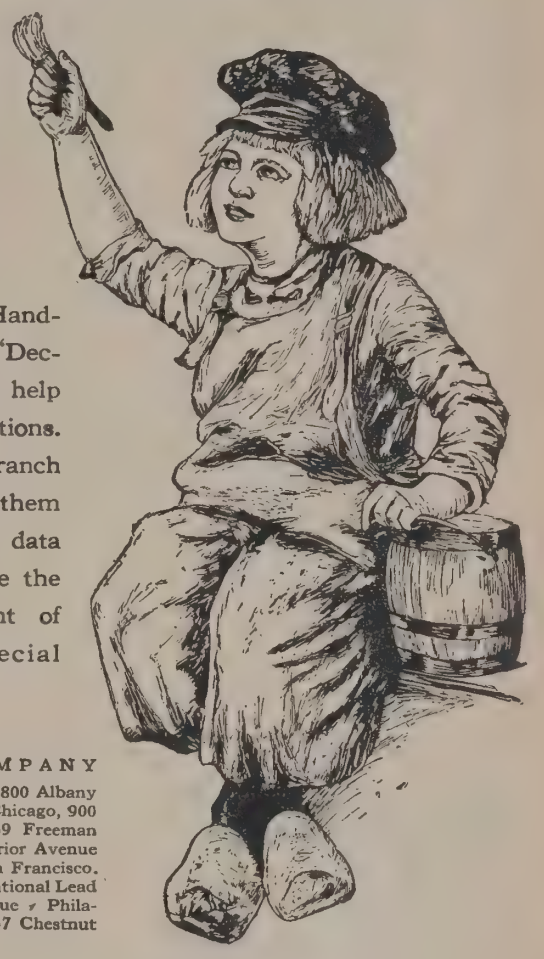
It makes no difference which teats are milked first, but after a regular system has been formed it is not wise to change. It is usually more convenient to milk one front and the diagonally opposite hind teat at the same time. The process should be continuous and rapid but without feverish haste. Long, steady pulls get the milk faster and with less annoyance to the cow than short, quick, nervous jerks.

If the teats are short or the hands tire easily, the "Swiss style" of milking is recommended. This consists in flexing the thumb against the palm of the hand with the nail side against the teat, pressing the four fingers against the opposite side of the teat and squeezing downward from the top. It may take a little practice to learn this method, but it is worth all the patience and effort necessary, as one can milk faster and with less fatigue. The writer has always employed this method with all cows except those having very large teats.

It is important to empty the udder at every milking. Nothing will dry up a cow more surely than to leave a little milk each time. Mother Nature takes this as a sign to slacken up on the supply. She says in effect: "This calf is now eating grass and will soon be weaned." You must fool nature into thinking that the calf is still on the job with a husky appetite and taking all the milk the dam can manufacture. The most profitable cows are those which do not dry up quickly but give a steady flow throughout the year.

Stripping with the thumb and forefinger is only one way to get the last of the milk which is the richest in butterfat. The Danes, who are leaders in good dairy practice, have a way of kneading the udder with both hands gently pressing down from above, first at the sides and then front and back, followed by a final stripping. This process imitates the butting calf that is striving to get the last drop. Vaseline or some other good ointment should be used frequently to keep the teats soft and to help heal up any scratches or sores that may appear on the teats.

I know men who feed good cows liberally on balanced rations and house them in comfortable stables, but who lose money every day in the year by careless habits of milking. The practice of right methods of handling milk cows might easily earn enough extra profit to pay for an up-to-date milking machine; but even then, the cows as well as the machine must be handled with skill and understanding. But that is another story.



NEW DAIRY BARN OF J. W. ZICK, MINNESOTA

For your property's sake use plenty of paint. For your pocketbook's sake make it long-wearing lead paint, made of Dutch Boy white-lead

WHAT paint shall I use for my farm buildings? How should it be used on wood, concrete, stone, plaster, stucco? What colors are best inside my house and out? Our booklets—"Handbook on Painting" and "Decorating the Home"—will help you answer these questions. Write to our nearest branch for the booklets. With them you get a decorator's data form to use if you desire the help of our Department of Decoration on any special painting problem.

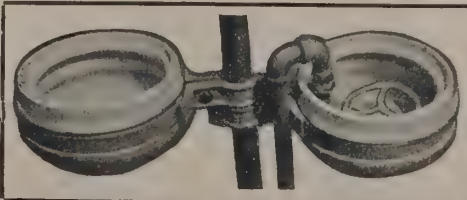
DUTCH BOY WHITE-LEAD



A WONDERFUL SUCCESS

"Nothing succeeds like success," they say, but where success is constant and increasing there must be some unusual merit back of it. The continued success of the **Auto-Oiled Aermotor** is based entirely on merit. It has been made better and better year after year. Improvements have been added as experience has shown the way. The **Auto-Oiled Aermotor** of today is a wonderfully durable and efficient windmill.

The Aermotor Company, more than 12 years ago, solved the problem of complete self-oiling for windmills in such a way as to make the system absolutely reliable. The oil circulates to every bearing and returns to the reservoir with never a failure. There are no delicate parts to get out of order. The double gears run in oil in a tightly enclosed gear case.

Self-Oiling Water Systems
A REGISTERED TRADE NAME

Think of a Myers Water System in terms of a bracing shower bath after a hot day's work in the fields—in terms of quickly washed dinner dishes—of running water in barn and feed lot—of unfailing fire protection. A Myers Water System will be the most permanent, the most satisfactory and the most valuable investment you have ever made.

Myers Self-Oiling Water Systems and Power Pumps are made in a wide variety of styles to meet every requirement of water supply and water service.

Whether you require 200 gallons an hour or 10,000—an outfit for a deep or shallow well—for operation by hand, wind, gas engine or electric current from any source—there is a Myers built for *your specific needs!* And all Myers Systems are *thoroughly reliable.* You are assured of complete satisfaction from any outfit you select from the "World's Headquarters for Pumps and Water Systems."

For a demonstration see your nearest Myers Take Off Your Hat to The MYERS *dealer, or write us today for new catalog.*

Opinions, Brickbats, and Bouquet

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page but your editorial must not exceed 250 words. Hoard's Dairyman assumes no responsibility for opinions expressed.

Three Legs of the Milk Stool

HOARD'S DAIRYMAN:—Just a word from an interested subscriber. Is there not an understandable program toward which the agricultural interests and the agricultural press should bend their energies to secure fair play for the farmers?

1. The Protective Tariff. Should there not be a high protective tariff on all the output of the farms—grain, fat, live stock, fruit, etc.,—which would absolutely guarantee the United States market to the farmer for what he has to sell? Leg one of his milk stool.

2. Co-operative Buying and Selling. Affording an efficient way of disposing of what he has to sell. Having in mind the efficient and abundant supply of the home market. Leg number two of his milk stool.

3. The reasonable limitation and equalization of his production having in mind the efficient and abundant supply of the home market. Leg number three of his milk stool.

The export of his surplus being the minor consideration could easily be cared for after the home market is efficiently cared for.

Manufacture, banking, and railroads have favorable legislation enabling them to enjoy unparalleled prosperity. Should not the widow's son be recognized as belonging to the family and be treated with the same consideration as the rest of the family? Is he the half-wit brother without mind enough to ask the question and determination enough to insist upon fair play?

Indiana. R. A. MORRISON.

Lives on "The Main Street of America"

HOARD'S DAIRYMAN:—The very pleasant and interesting visit made a few summers ago by several of us Ozark dairymen to the Dougan dairy farm near Beloit is now being most agreeably recalled by weekly contributions in Hoard's Dairyman from Mr. Dougan himself.

I am glad to express my personal appreciation of the hospitable and delightful reception and entertainment given us by Mr. Dougan and his family when we were there. In the current issue of Hoard's Dairyman you give us in Mr. Dougan's write-up a good picture of our bunch standing on the driveway of Mr. Dougan's fine dairy barn. I certainly enjoyed this write-up, especially at his close-up he allows his fancy to dive into poetic expression and quotes thus from Sam Walter Foss:

"Let me live in a house by the side of of the road
Where the race of men go by;
The men who are good and the men who are bad,
As good and bad as I.
I would not sit in the scorner's seat
Or hurl the cynic's ban;
Let me live in a house by the side of the road
And be a friend to man."

My guess is that he has not yet met the average tourist in bulk or en-masse. Or if he knows many of them—that is enough of them to come in contact with them every minute of the day—he was probably snowed in on that day and none of them crowded his traffic way. My 680-acre dairy farm here in the Ozarks has a full mile of the right of way of *"Main Street in America"* running through the middle of it. Perhaps you heard of this *"Main Street of America."* It is the transcontinental paved federal Highway No. 66 out of Chicago through St. Louis, Springfield, and Joplin on to Los Angeles. During the past winter through traffic on it crowded it almost to capacity, so that I am personally well "fed up" on the poetic glory of *"living in a house by the side of the road."* My dairy barn here has an equipment that Mr. Dougan's barn has not got. It has a brace of bull dogs that are unleashed after dark every night. With apologies to Sam Walter, let me say:

Let me live in a house at the end of the road
Where never a soul goes by.
I am sick of the public-front abode
Where the world spins past on high.

I am sick to death of the raucous horn
And the scream of the sudden brake
And the all night crowd with its lordly hor
Of whether I sleep or wake.

Oh! I am a friend to my eager friend
And no foe to my fellow man,
In my humble hut at the dirt road's end
I'll be as sociable as I can.

But why should I live by the side of the road
Where the dust and the gas fumes fly
Or mow my lawn for the flivver's fleet
As the whole dum world goes by?

If you love me you'll turn down my way
Though it leads to no other spot.
A road's end sweet when the twilight's gray
And a hearth fire boils the pot.

Where the crowds don't go—be my Good
bestowed;
To avoid the tourist's clan
Let me live in a house at the end of the road
Away from the motor man.

Missouri. EUREKA FARM

What Is the Trouble

HOARD'S DAIRYMAN:—I have been reading the O. B. & B. column and I find some very good ideas expressed there. We as farmers all seem to be agreed that the farmers need some assistance, but there seems to be a great difference in opinion as to just what the trouble is and also what the remedy should be.

It strikes me that the professor at Ames hit the nail on the head when he said that the farmers send all the big potatoes to the city. For an illustration let's take the dairymen of the country. Instead of saving the best heifer calves from year to year let's market them for veal and sell the scrubs and misfits for a few years, and see what the dairy cows would be like.

It strikes me that for one thing our educational system is to blame for a lot of our troubles. We send our children to school and most of them that make the grade go into other lines of endeavor, while the nit wits, etc., that can't get by stay on the farm. It seems to me that the business of farming is big enough so some of our captains are needed as community leaders. I don't see how we are to be helped by laws unless we have some real farmer-minded men to help make those laws. I don't see how we are to be helped by co-operation unless we have men competent to direct the organization. We have allowed the rest of the business world to think that a strong back and a weak mind are about all that is necessary to be a farmer. I believe brain as well as brawn is necessary.

Michigan. E. H. KIRKLIN

Mother—"No, Willie, for the third time I tell you that you cannot have another piece of cake."

Willie—"Aw, I don't see where she gets the idea that you're always changing your mind."

HERD PROGRESS IN NEW JERSEY

E. J. PERRY, NEW JERSEY

THE Salem—Gloucester Cow Testing Association has uncovered the story of the progress made recent years by the herd of Holeins owned by Henry Edwards of ew Jersey.

Mr. Edwards first joined a cow esting association in 1919. His year-

HENRY EDWARDS WITH HIS FOUNDATION COW ON THE RIGHT AND HER BEST DAUGHTER ON HIS LEFT

average at the end of the first 12 onths revealed a fairly good herd—ith a yearly average per cow of 431 lbs. milk, 246 lbs. fat. Today s herd average is 9,723 lbs. milk, 337 s. fat, made on two times a day ilking. The increase amounts to 292 lbs. milk and 91 lbs. fat. Feed sts and income over feed cost averged as follows per cow:

	Feed cost	Income over feed cost	Feed cost 100 lbs. milk
19	$126	$160	$1.70
36	143	168	1.47
ference	$ 17	$ 8	$ .23

With 19 head of milking cows, Mr. lwards is now getting 43,548 lbs. ore milk in a year than he did in 19. Figured at $2.75 per hundred, s is worth $1,197. In 1919 the price milk ranged from 7.5c to 8.5c per art, or approximately $3.60 for a ndred pounds. It will be noted refore that the yearly income over d increased very little, and is exined by the drop in milk price. th the same calibre of cows that he d in 1919, where would Mr. Edrds' profit be today? He has coped te successfully with the economic nges—the lowered milk prices and reased feed costs—by improving herd to meet the situation. A litinvestigation of one of the leading sons for a rapid growth in the d average returns per cow is rth while.

Blood Does Tell

Nineteen years ago Mr. Edwards rted in the dairy business with 15 mon cows of various colors. In 13 he bought his first registered l, a Holstein and a son of the faus Spring Farm King Pontiac. ven grade daughters were raised m him and were much better than their dams. This fact was interesting and profitable to the owner and was convincing evidence that the results of 150 years of selection and breeding by master Holstein breeders is for the benefit and use of present day dairymen and is obtainable in the thousands of the pure-bred sires now available. In 1915 two registered cows were purchased. The second bull, a son of Judge Hengerveld De Kol, was secured in 1915. The dam of this bull was Wiebe 6th, an imported cow. The third sire came from Winterthur Farms and is still in use. His dam has a record of 16,141 lbs. milk, 690 lbs. fat. A junior sire recently purchased in co-operation with a neighbor, R. H. Skinner, is a grandson of Polly Douglas Fayne.

A glance at what transpired among the females is most interesting. One of the first two pure-bred cows bought in 1917 is a dam of a 10-year-old cow now in the herd that has proved an extraordinary foundation animal. In production she has been only fair but she has been prolific and has thrown 6 daughters and 3 bulls, all of splendid constitution, type, and producing ability. Her name is Polly Calamity Hengerveld 326796. In eight years she yielded 65,016 lbs. milk, or an average of 8,127 lbs. Her best year's record was 9,374 lbs. She has 7

HENRY EDWARDS WITH THE BEST DAUGHTER OF HIS FOUNDATION COW

granddaughters and 3 great granddaughters.

The yearly records of this old cow and all of her milking offspring, through her daughters, follow:

	Age Yrs.	Milk Lbs.
Foundation cow, 8-year ave.....		8,127
Foundation cow	6	9,374
Daughter A	5	13,500
Daughter B	4	11,831
Daughter C	3	11,420
Daughter D	2	7,875
Granddaughter A	4	13,500
Granddaughter B	3	9,778
Great granddaughter A	3	10,000

Reducing all of these records to mature equivalents shows an average of 13,120 lbs. which exceeds the best record of the old cow—9,374 lbs. milk—by 40 per cent. This is an illustration of what it is possible to do by the judicious selection of registered bulls from cows of known production. The 4-year-old granddaughter, sired by the Winterthur bull now in use, has started off with these records: As a 2-year-old, 9,300 lbs. milk; as a 3-year-old, 10,288 lbs. milk; as a 4-year-old, 13,200 lbs. milk.

This heifer's performance constitutes an argument for retaining well bred bulls until their daughters produce. Purchasing a high class pure-bred bull carries with it the assumption that the buyer has faith in the animal's ability to work improvement, yet there are hundreds of such buyers who will not spend the price of a cow to build a pen that will enable a bull to be retained—a bull that might work wonders in increasing production and improving type in the herd. If the bull is "half the herd" for those raising young stock, why sell and buy half of a herd every three or four years? Exchange him temporarily for another bull of merit and return him later.

The use of three good bulls has been the biggest factor in increasing Mr. Edwards' herd production 27 per cent and the production within a family 40 per cent.

Future progress in his herd will probably have to be made with proven sires. For all dairymen who feel or know that they have cows of the ability of those in the present Edwards herd, the time to attempt the use of proven sires is now. For those whose cows are as good or not as good as Mr. Edwards were in 1919, there is a chance that if proven sires are used at once, that much time can be saved and rapid progress made in building up high production and consequent profits.

THE EDWARDS' HERD OF HOLSTEINS THAT AVERAGED 9,723 LBS. MILK AND 337 LBS. FAT

Silage Corn or Field Corn for Silage

The question of whether to plant a so-called late variety of silage corn for silage or a good local variety of field corn for this purpose frequently is asked by those interested in getting the most feed per acre.

The Ohio Station compared a late silage corn with a fairly early maturing field corn for five seasons. After the silage was made, feeding trials were carried out with dairy cows to determine which silage was the best for milk production.

In production of silage both varieties were calculated to a uniform dry matter basis. When compared in this way the later silage corn averaged to yield .96 ton per acre more than the earlier field corn. The green husked ears averaged 37 per cent of the weight of the plants of the early variety; the green husked ears averaged 31 per cent of the weight of plants of the late silage variety. When samples of ears from both varieties were kiln dried and shelled the grain constituted about 40 per cent of the total dry matter in the early variety and 25 per cent in the late variety.

A comparison in percentage of the results of feeding the silage to cows showed that where both milk production and gain in weight were considered, the earlier variety of corn appeared to be about 7 per cent more efficient.

The results of the five tests indicate that for silage, all things considered, there is little difference in returns per acre between the ordinary varieties of field corn and the large, late so-called silage corn. A long, favorable growing season would favor the late variety if compared on the dry matter basis.

The New

FISK TIRE

Extra Comfort

Extra Safety

Extra Mileage

For every tire job there is a Fisk tire especially designed to do that job especially well. Maintaining the Fisk reputation, anticipating the desires of the motoring public, Fisk offers The New Extra Heavy Balloon Tire, the latest and greatest achievement of tire craft.

Good-looking beyond comparison, The New Fisk Extra Heavy Balloon Tire also sets new standards for safety with complete comfort.

This new super-balloon tire, built of "Fillerless" Cord, the Fisk patented process, surpasses all others for smooth riding, safety, sure traction, ease in steering and appearance. Judge The New Fisk Extra Heavy Balloon by its extra mileage of super-service.

Let your local dealer show you why you need The New Fisk Extra Heavy Balloon Tire.

There is a Fisk Tire for every car, every road, every purse.

Always Gets a Good Meadow

H. E. McCARTNEY, INDIANA

IN Shelby County, Ohio, a number of farmers told me of one of their neighbors who always succeeds in getting a stand and a good crop of alfalfa or clover.

So often was the statement repeated, "Harry Marrs always gets a good meadow," that I became interested in visiting him and seeing for myself just how he did it.

As I approached the Marrs' home I saw a splendid field of alfalfa. I would have guessed that this particular field belonged to the man to whom so many referred me. The stand was perfect over the entire field; likewise the growth was good in all parts of the field.

After seeing the alfalfa, I became more anxious than ever to know the methods Marrs was using. Also, I wanted to know if his plans were such that any of us could make use of them in operating our own farms.

Marrs was in one of the back fields at work. I drove through the farm lane to meet him and talk with him. I passed a splendid field of corn and then one in which there was a heavy crop of sweet clover and finally a pasture where a mixture of grasses was making a rather luxuriant growth. I noticed that the pasture gates were open and that they were so arranged that the cows could go at will from the grass mixture to the sweet clover.

After talking with Marrs, I was able to reduce his essential principles to four very simple ones. First of these, he practices a 3-year rotation; next he practices thorough methods of tillage; third he uses an abundance of acid phosphate. As a fourth, his farm is well drained with tile. Very likely it is a combination of all these that enables him to be so successful with his pastures and meadows.

One thing I noticed was that there were no weeds in his alfalfa, sweet clover pasture, or his corn. There were none in the field where he was at work. He said that he does not fight weeds. Simply he makes it so easy for his regular crops to grow that they leave no opportunity for weeds.

Corn is the main crop in his rotation. This crop is regularly grown upon clover sod. Usually he fall plows the clover field but, failing in this, he plows early in the spring. The disk and harrow are used until the best possible seed bed is prepared.

Wheat or oats constitute the second crop in the rotation. His corn land is divided about equally between these two crops. Wheat is put into the corn field with a one horse drill. Along with the seeding of wheat he puts 300 pounds of 16% acid phosph per acre. The oat crop is drilled in the spring after plowing or disk and thoroughly preparing a seed b Just as with the wheat, he uses pounds of the 16% acid phosph per acre. His idea is that with wheat or oats is the best opportu to get the acid phosphate into the tation. Also, the best results from th use are shown when it is put in w the small grain.

Occasionally he finds it advisable grow corn on a field for two succ sive seasons. This lengthens the ro tion to four years. In this case uses 300 pounds of the 16% a phosphate with the second year corn.

His clover crops are sown in small grain during the early spri His thorough cultivation has mad splendid seed bed for the tiny clo seeds. So, his seedings of clover grass are likely to make a good st After harvesting the grain crop growth during the fall is usu abundant.

Marrs prefers red clover for but is enthusiastic over sweet clo for pasture. He says, "Sweet clo is the only pasture crop that does dry up." Then, in proof, he pointed the field beside which I had just dr en. The growth was splendid and seemed that there would be no c ing in the growth of new shoots fresh green leaves.

As a soil builder, it is his idea th roots of the sweet clover go de deeply into the soil and pull up fert ty which they leave in their lar crowns near the surface. He thi that this decreases the amount commercial fertilizer needed in i fields.

Marrs explained to me that h field in which he was working to day had been in his possession ly three years and that it had been ld ly run down when he got it. Howe through thorough tillage and the s of acid phosphate he had brough it back to a rather high producing st Last year the oats grown on it a averaged 71 bushels per acre.

Each year, during summer and fall he hauls manure from his barns to yards to the clover fields which is plowed under for one of his bune corn crops.

His alfalfa is grown in a field aside for it and not as a part of h regular rotation. He lets the stand in alfalfa as long as it wes well and as long as bluegrass does o threaten to interfere with its y

A ONE AND ONE-HALF HORSE POWER ENGINE PERFORMING AT ONE TIME TWO TYPICAL FARM JOBS

One of these, the pumping of water, is a daily affair on the farm and when done by hand is a monotonous and irksome task. How many of us as boys, also, have hated tha frequent drudge of turning the grindstone while father slowly sharpened his tools Small engines such as this make life on the farm more livable for every member fron mother and father down.

Nitrogen in Sweet Clover

THE ability of sweet clover to supply soil with organic matter and nitrogen is shown by some work done by the Illinois Experiment Station in 1922 and 1923. Representative samples of tops and roots of the biennial white sweet clover were taken from uniform areas and the air dry weight of these determined together with an analysis for nitrogen content. Samples were taken at intervals throughout the growing season beginning in one trial on September 11 of the same season the seeding was made and continuing through the following season to July 16. Samples were taken in a similar way of other seedings. The seedings were made with early oats using 10 lbs. sweet clover seed and 2 bushels of oats per acre.

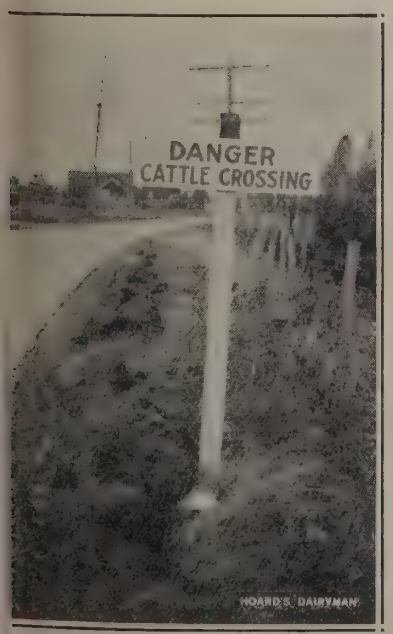
From the standpoint of organic matter and nitrogen supplied, the most important data of these investigations are those showing the data of the maximum tonnage of tops and roots and the nitrogen contained therein of the plants in the fall of the year seeding was made and during the summer of the second year's growth. These data on the acre basis are as follows:

Date sampled	Maximum yield organic matter Total tops	Total roots	Total plant	Total nitrogen
	Lbs.	Lbs.	Lbs.	Lbs.
November 9	3,350	5,200	8,550	276
November 16	1,320	3,970	5,290	180
Ave. (fall)	2,335	4,585	6,920	228
June 30 (2nd yr.)	6,970	1,950	8,920	206
June 19 (2nd yr.)	12,010	2,160	14,170	308
Ave. (2nd yr.)	9,490	2,055	11,545	257

It is interesting to note that in November of the same year sweet clover was seeded the roots constitute 36.2 per cent of the air dry weight of the total plant whereas in June of the second year growth this percentage has dropped to 17.8 per cent. Another interesting thing is that 6,920 lbs. of the total fall growth contained nearly as much (228 lbs.) nitrogen as was contained in 11,545 lbs. of the top and root growth of the crop the following June. This latter amount was 257 lbs. nitrogen per acre.

The maximum top growth of the first year plants was reached on September 27 one year and on November 9 another year. The average of these was 3,055 lbs. The maximum nitrogen yield of the second year plants was reached one year on April 19 and another year on June 7. The average of these was 336 lbs. per acre. These facts are of special significance from the standpoint of a green manure crop. The fall growth plowed under plus the root growth, 3,055 lbs. total, containing 201 lbs. nitrogen per acre, is a cheap way to add organic matter and nitrogen to the soil. The chief disadvantage to this practice is the fact that these plants thus plowed under in the fall are not all killed and may give considerable trouble to a cultivated crop the following season.

One can avoid this difficulty by late spring plowing. In this case, according to these investigations, one could, by plowing the last of April, incorporate approximately 2 tons of organic matter air dry basis and 200 lbs. nitrogen per acre.



To dairymen, always in need of good legume pasture, the biennial sweet clover offers much of value in the way of combining both feed and manurial benefit. The top growth of the first year may be pastured or cut for hay and the root growth together with what new top growth made the following spring may be plowed late for corn. Where soil conditions are suitable the seeding of sweet clover in with oats does not materially take away any of the normal oat yield.

Cattle Crossing Signs

HOARD'S DAIRYMAN:—Many dairymen in some of the Pacific northwest states have signs put up along the highways about a hundred feet in each side of their cattle crossings to warn the passing motorists that they must be careful. In Washington, especially, we saw a great many such signs because it so often happens that the road separates the pastures from the barn lots.

We do not have any available statistics as to the annual number of dairy cows that are killed when crossing highways, but Wisconsin's Highway Commission is of the opinion that the number is not large. Some dairymen have secured permission and have built cattle underpasses rather than daily risk driving their valuable animals across a congested highway. This is no doubt a commendable practice. We asked concerning the liability in the event a motorist collides with a herd of cows that are being driven either along a road or across it and were told that the car driver would have to pay damages. However, unattended animals pasturing on the roads in most states must run their own risk and in some states the owner of them is responsible for their actions and must pay for any injury due to collision with a car unless it can be proven that the driver was exceeding the speed limit for that particular stretch of road.

Wisconsin. G. A. PETERSON.

Cattle crossing sign near Arlington, Washington, that warns the passing motorist to caution lest he collides with some dairy cows.

Milk and Cream Excluded

An absolute embargo against milk and cream originating within a radius of 200 miles of Montreal, Canada, has been ordered by the Bureau of Chemistry, United States Department of Agriculture, on account of the danger from typhoid infection. This action is taken under the Federal Food and Drugs Act which authorizes the exclusion of articles that are dangerous to health. In placing this embargo the Bureau of Chemistry has the cooperation and advice of the United States Public Health Service, the State Department, and the Customs Bureau of the Treasury Department.

The typhoid outbreak began March 4 and to date more than 1,000 cases have been reported in and near Montreal.

Better Crops Special

"Better seed means better crops and greater profits." "Where clover grows, milk flows." "Nature has done her part. Let us do ours."

Blazoning forth these three slogans, the Better Crops Special railway train visited every one of the fifteen counties in the Upper Peninsula of Michigan during the month March 23 to April 23. Six railroads co-operated.

Dairy cows are increasing faster than feed is being produced in this territory. A large quantity of poor and inferior seed is planted that reduces the income of these farmers many thousands of dollars annually. Better crops can and must be produced.

C. M. McCrary, potato specialist, and C. E. Skiver, crops specialist of Michigan State College; G. W. Putnam, superintendent of the Chatham Experiment Station; and George E. Bishop, secretary of the Development Bureau; were among the speakers who presented the case of better crops on the tour.

The special train with its exhibits and speakers was the opening gun of a big better crops campaign for the Upper Peninsula. Crop growing contests will follow the visits of the train in every county and the Development Bureau has already offered $750 in cash prizes.

He only really lives who enjoys his work.—Hale.

AMERICAN STEEL & WIRE COMPANY

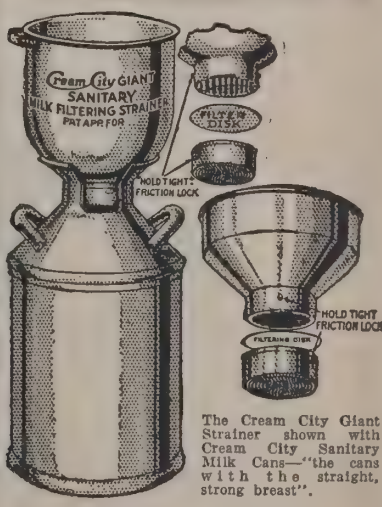
It's Easy to Build Fences with Posts Like These

No holes to dig, no tamping and no staples to buy. Note the big features which are exclusive in Banner Posts and which mean so much in extra service.

Banner Steel Fence Post GUARANTEE

All Banner Steel Fence Posts are made of railroad rail design with heavy backbone reinforcing. They are made of NEW STEEL *and are* GUARANTEED *to give the equal of or longer service than any other steel fence post of same weight which is used under similar conditions.*

Any buyer who will show that Banner Posts, purchased through his dealer, have failed to give this service, will be supplied by us with new posts, free of charge and without delay.



With Banner Steel Posts the fence line can be burned off every year, thus getting rid of weeds, insects and rubbish. The clean farm grows the best and biggest crops and with the least labor and expense. See our dealer in your community.

More Profits from Cleaner Milk!

The Cream City Giant Strainer shown with Cream City Sanitary Milk Cans—"the cans with the straight, strong breast".

Two 14-quart pails can be poured into the Giant at one time

The Cream City Giant actually filters the milk, removing every particle of foreign matter. Contamination is removed at its source—pure milk can be kept sweet much longer.

Large, strong, seamless. Heavily retinned—indestructible. Two styles. The Giant for large production—No. 1090 for the small farmer. Both are easy to keep clean and sanitary.

Get bigger sweet milk profits!

SEASONABLE LIVE STOCK NOTES

BLOATING in cattle may be caused by any kind of feed that produces indigestion but the disorder is usually caused by alfalfa, clover, or other succulent pasture forage eaten greedily, especially if wet by dew or rain. The time has arrived when precaution must be taken to prevent bloating or to treat it effectually should occasion arise.

The best method of dealing with the problem is foresight in preventing conditions favorable to the ailment. Before cattle are given access to new pastures, especially if wet, they should be fed some hay or other dry roughage to partly fill their stomachs. Even with this it may be advisable to limit the time they are on pasture each day if they show signs of greediness for this palatable feed.

Should animals become mildly affected, forcing them to walk at a rapid pace for a half hour is sometimes effectual. Another treatment often successful is to coat a piece of rope with axle grease or pine tar and fasten it in the animal's mouth thereby causing considerable movement of the tongue, jaws, and throat as well as stimulating the secretion of saliva. This action aids in the escape of gas.

The formalin treatment is also recommended. The affected animal is given as a drench a quart of water to which has been added one-half ounce of formalin. After drenching, the mouth is held open by a round stick placed between the jaws to facilitate the escape of gas.

In severe, urgent cases where relief must be obtained without undue delay, the use of the trocar and canula is effective but the operation should be performed by one experienced in the use of the instrument. Knife wounds in the paunch should not be made.

Water Founder

Acute founder may result from several different causes. The cause to which attention is called at this time is that of drinking a considerable quantity of cold water when a horse is warm or somewhat overheated. It occurs most frequently on hot days in the early part of the hea work season or during harvest tim

The symptoms of the acute form founder are easily recognized. T affected animal persists in standing one place; it being almost impossib to make it move, especially backwar The horse stands with fore feet fo ward, throwing as much of the bo weight on the hind feet as is possibl A striking symptom is the inability back. The animal is in great pain the fore feet.

The treatment should be promp It is both local and internal. Wr the feet in a large blanket and ke wet with cold water. Where possib the feet may be tubbed. After son improvement is noted, stand the an mal with the feet in a clay puddl Give a purgative of ¾ pound Epsom salts. Feed a light laxati ration. Provide grass when availabl Give rest until recovery is complet

Minerals for Cows

Inquiries are numerous askin about mineral supplements for dai cows. Limited experimental eviden indicates that the assimilation of mi erals from the feed is greater or mo efficient under certain conditio than under other conditions. It further indicated that phosphor calcium (lime), and chlorine are mo likely to be deficient in the ratio

Inasmuch as the results of expe ments show that cows can take t mineral elements out of feeds mo efficiently while they are on gre pasture in direct sunshine than und any other practical conditions, it timely to suggest that they be giv access to a simple mineral mixtu during the summer. This appli particularly to the heavy producin cows—the ones most likely to ha given up some of their mineral r serve to production.

We suggest a mixture of equ parts of salt, bone meal, and fine ground high calcium limestone supplied cows when they go out pasture.

Should Vaccinate Pigs

The tremendous losses experienc from hog cholera last season prom us to call attention to the practice vaccinating spring pigs as soon they are weaned. This is especial advisable in sections where chole took toll from a large number farms. Pigs at this age may be i munized at the lowest cost and it a fords a safe protection. Those w take a chance and later find it nec sary to vaccinate, run the risk of so loss but also they must pay more f the protection.

Emergency Hay Crops

A number of dairymen for vario reasons find it necessary to resort emergency hay crops if the needs their herds are supplied the comi winter. We suggest soy beans sudan grass for this purpose. S beans will grow on soils too acid f alfalfa or red clover but are be fitted by lime. The seed should inoculated. The yield varies from 1 to 3 tons per acre of hay nea equal to alfalfa in the dairy ratio Soy beans may be planted any ti after the soil is fit for corn and up June 15, the time depending on t variety selected. Sudan grass, thou not a legume, affords a good yield fairly good forage. It may be seed after corn is planted and up to Ju 15. About 15 lbs. of seed per ac are needed.

"Improvement in quality is the be guarantee of future profits."—HIR SMITH.

From Stem to Stern
Sealed against Grit!

$34.18 per HP 20-35 H P

Allis-Chalmers engineers have added years to tractor life by keeping grit out of the motor. Metal cases enclose everything. Then the three great cleaning devices shown in the panel, remove every particle of grit that gets inside the motor.

Engineers say these improvements should double tractor life. Extra power, extra life, low cost per h. p.—these will bring you extra profit. It's well worth while to find out just how Allis-Chalmers actually does bring extra profit. Write today for booklet.

Genuine Cork Linoleum Rugs in NEW–DIFFERENT–PRETTIER *Patterns*

"This is the new decorated Jaspé Rug. Isn't it just the prettiest rug you have ever seen?"

TRULY, few people thought that smooth-surface rugs could ever be made so pretty. Genuine Armstrong's Jaspé Linoleum with the new overlaid border. Nothing like it has ever before been offered in smooth-surface rugs. Gray, green, blue, brown, taupe or rose Jaspé with several colorings of border design to choose from! Such rugs add the brightness and charm of color to an otherwise dull and cheerless room.

Indeed, they suggest endless ways of brightening up the house, from kitchen to bedroom. One of these delightfully different and original patterns on the floor of each room will give an air of cleanliness and freshness to the house which will not soon disappear. The newness of an Armstrong Rug lasts a long, long time because each mopping restores its original brightness.

There is no way you can fully realize the attractiveness of these new patterns except to see them yourself in the stores. Be sure to ask for the new Armstrong's Linoleum Rugs by name. You will find they are made of the same long-wearing genuine cork linoleum with the burlap back . . . . flexible, quiet, resilient, soft to the tread. Surprisingly low in cost, too—less than they ever have been! Yet they will constantly give you greater satisfaction and far longer wear than rugs made of less desirable material and in less original designs. Look for the Circle A trade-mark, too. You will find it printed on the burlap back of every genuine Armstrong Rug.

In the main illustration: *Jaspé Rug, Pattern No. 725.* Above: *Inlaid Rug, Pattern No. 1011.* Right: *Pattern No. 808.*

An Armstrong's Linoleum Rug on the floor means relief from scrubbing and drudgery. Its bright, smooth surface is so easy to clean—just a quick mopping with a damp cloth. You will always "bless the day" you bought an Armstrong Rug for the floor.

"RUGS OF PRACTICAL BEAUTY"

If you can't get out to the stores to see these new Armstrong patterns, this booklet will help you make your selection. Printed in full colors, illustrating all the new patterns. Send for it. It is free of cost. Address Armstrong Cork Company, Linoleum Division, 1014 Jackson Street, Lancaster, Pennsylvania.

Prepared house paint—*at its best.*

Don't be fooled on House Paint!

"Cheap" paint isn't cheap at all!

WHEN you buy paint to dress up and protect your house, don't let a "low price" blind your good sense. Thousands of home owners are bewailing a "cheap" paint job this very minute and are paying a heavy penalty in hard cash and regrets.

"Cheap" paint is made of cheap or skimpy materials. How else could it be sold at a low price in our highly competitive markets?

Cheap or skimpy materials make a poor, weak grade of paint. That's only sense. It may *look* like paint and *smell* like paint *in the can.* But on the brush and on your house—the poor quality shrieks so all can hear it.

If you are tempted to use a "low price" house paint—one that is claimed, even guaranteed and warranted, to be "just as good as SWP," —*GO SLOW!!* Remember that *low price* and *low quality* go hand in hand. You can't make a silk purse from a sow's ear.

Compare the "cheap" formula with SWP!

Make the formula test! Insist upon seeing the formula of the "cheap" paint, either on the label or in the literature of the company.

Compare the materials used in making the "cheap" paint with the ingredients of fine old SWP House Paint—as shown in the formula which is plainly printed on every SWP can. Take Outside Gloss White for example.

Note the big percentage of *White Lead Carbonate* and *White Lead Sulphate* used in SWP Outside Gloss White. White lead should be the basic ingredient of all white paint and light tints. It is to these paints exactly what flour is to bread.

See how much less of this basic ingredient is used in the average "cheap" white paint.

Zinc oxide, another costly pigment, is the next essential ingredient. A liberal percentage of zinc oxide combined with a large amount of

THE ACCEPTED STANDARD THE WORLD OVER . . .

SHERWIN-WILLIAMS HOUSE PAINT

white lead makes for a *balanced formula*—such as the formula of S W P Outside Gloss White House Paint. It assures a finish of superior wearing quality.

More than 90 per cent of the pigment content of SWP Outside Gloss White House Paint is made up of these two important ingredients —white lead and zinc oxide.

In the majority of "cheap" white paints you will find only 50 per cent *and in some instances even less.*

It is the liberal quantity of this expensive basic material in every can of SWP Outside Gloss White that gives it such remarkable covering capacity.

In the darker colors like browns and greens, the "*balanced formula*" of SWP House Paint is even more important. Naturally, these dark colors can contain little, if any, opaque white pigment such as white lead or zinc oxide.

Sherwin-Williams have the pick of the world's colors. Sherwin-Williams Dry Color Works produce practically everything except the natural earth and mineral colors. That is why SWP colors are so rich, so permanent and so true to character.

Greater durability of the paint film on your house is assured by SWP due to the use of a specially treated pure linseed oil—made in Sherwin-Williams' linseed oil plant.

360 square feet per gallon or only 250—which?

Some people think that SWP House Paint is an expensive paint because it costs more per gallon. That is not so.

Ask your painter to use SWP—for best results.

As a matter of fact, SWP is the least expensive house paint *on the wall*—on the market. And here is why:

A gallon of SWP will properly beautify and protect three hundred and sixty square feet of your house—two coats.

Will a "cheap," low price, inferior quality of house paint do that? No!

The best you can get from a gallon of the average "cheap" paint is two hundred and fifty square feet!—two coats.

Right there, in that *forty-four per cent greater coverage*—in the fewer gallons of SWP needed—the difference in price per gallon is nullified.

On the wall—in actual gallons needed to paint your house—Sherwin-Williams House Paint costs no more and often *less* than the cheap, low price kind.

And remember this: It costs no more to put on a good house paint than to put on a "*cheap*" paint. Which would you rather have?

Once your house has been painted with SWP House Paint *your saving has only begun.* A beautiful SWP job outlasts the average "cheap" paint by several years. This is widely known.

You get more years of protective service

It dries to a firm, elastic, glossy surface. It weathers slowly. There's no cracking or chipping or peeling —if properly applied.

Long after a "cheap" paint job has taken on the appearance of a pair of faded overalls, you can wash the dust off an SWP job with plain soap and water, and the colors will come up like new.

You save repainting expense

And when repainting is needed it can be done easily, quickly and with much less paint, *because the SWP surface is in perfect condition.*

Compare that with a "*cheap*" paint job that fades out and wears out quickly—that cracks and chips and peels—that has to be repainted often—and that costs more to repaint because it has to be burnt off, or scraped off, at every repainting.

* * *

SWP House Paint is sold by leading paint merchants everywhere. And each of these dealers is "Paint Headquarters" in his district. One of them is located near you.

See "Paint Headquarters" and save money

Before you let "cheap" paint blind you to real economy—see your local SWP dealer. He will estimate your requirements in SWP.

Compare the SWP estimate with what a "cheap" paint will cost. Then remember the greater durability of SWP—the exquisite colors that do not fade. Then specify the paint you think will serve you best.

If you do not recall "Paint Headquarters" in your locality, write us for the dealer's name. If you want expert help on a color scheme, our literature, color cards, or the famous Sherwin-Williams Household Painting Guide—just write. There is no obligation.

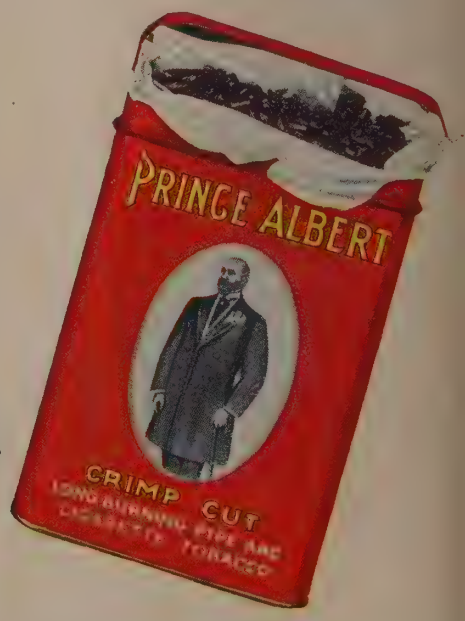
I usually pick a winner



SOME fellows are like that. Maybe it's long practice. Maybe it's instinct. It doesn't matter. I know I picked a winner when I wrote "Prince Albert" in my personal smoke-column. I have never had occasion to cross it out. It's there in indelible ink—to stay!

I knew I was on the right track the minute I got that first whiff of P. A. in the tidy red tin. It was fragrant and refreshing as mountain air. The first fire-up confirmed my belief that here was the one tobacco for me. It was cool and consoling. It tasted great!

Prince Albert is so mild that you can go to it, load upon load, morning to midnight. Yet it has the full tobacco body that lets you know you're smoking. It is so considerate of your tongue and throat. It's just a winner any way you look at it. It will win you too.

That's my guess, anyhow. I suggest that you get squared away immediately on this important matter. Your pipe can be either a cheer or a chore, depending on the tobacco you pack it with. There's no other tobacco anywhere like good old Prince Albert for *real* pipe-joy.

P. A. is sold everywhere in tidy red tins, pound and half-pound tin humidors, and pound crystal-glass humidors with sponge-moistener top. And always with every bit of bite and parch removed by the Prince Albert process.

PRINCE ALBERT

—no other tobacco is like it!

© 1927, R. J. Reynolds Tobacco Company, Winston-Salem, N. C.

Pushing Pigs for Early Market

ow well does it pay to push pigs c the early fall market? Some fig- s compiled by the U. S. Depart- t of Agriculture partially answer question.

he monthly average price per 100 ds at Chicago averaged for a od 1901 to 1923 inclusive and e averages compared by months w, in a general way, the varia- s in hog prices at this market.

aking the January price of hogs Chicago for 23 years the average 8.17 per hundred; the February age is $8.48; March, $9.07; April, 6; May, $9.01; June, $8.94; July, 0; August, $9.14; September, 9; October, $8.70; November, 4; December, $7.95.

ptember, July, April, and August the months of highest prices in order named. December, Novem- January, and February are the ths of lowest prices in the order ed.

cording to these figures hogs averaged $1.34 less per hundred ds in December than in Septem- at the Chicago market. During 3 years for which figures are in- ed there was only one year, 1909, hogs were higher in December in September. That year they aged 15 cents a hundred higher. year, 1906, hogs were the same in December that they were in ember. The greatest range in any between the September and De- er prices was in 1920 when hogs ped $6.33 a hundred from the ember average to the December age.

er a period of 23 years the aver- orice of September hogs was $9.29 hundred and for December this $7.95 per hundred. On the basis erages hogs marketed in Septem- ill bring $1.34 per hundred more in December; marketed in Octo- 75 cents more; and in November, nts more than in December.

Cost of Producing Pork in Terms of Corn

e cost of producing hogs, like of any other live stock or farm modity, varies greatly because of several greatly variable factors ing into their production. Cost oduction data, including all fac- that should be considered, are limited.

nty of data are available show- he feed cost of carrying pigs weaning time to market weight. easy to convert these feed re- ments into money value but this only a part of the story. The of pigs at birth and of carrying pigs to weaning time is not in- d. Likewise the charges that d properly be made for labor, ngs, other equipment, death veterinary expense, and such re not included.

ith of Purdue University has led data on the complete cost of producing pork, giving this in terms of bushels of corn. The data to be given cover pigs carried to the handy market weight of 225 lbs.

Where gilts are used and only 5 pigs per litter raised annually, the total cost of producing a 225-lb. pig expressed in bushels of corn is 25.91 bushels. The cost to produce 100 lbs. of pork is 11.51 bushels.

Where mature sows are kept until four years of age and only one litter raised annually of 7 pigs to the litter, the total cost of a 225-lb. pig is 25.29 bushels of corn and the cost of 100 lbs. of pork is 11.24 bushels of corn.

Where pigs are farrowed by mature sows which sows are kept until 4 years of age farrowing 3 litters in 2 years, 7 pigs raised to the litter, the total cost of a 225-lb. pig is 24.58 bushels of corn and that of 100 lbs. of pork is 10.93 bushels.

Where pigs are produced by mature sows and these sows kept for 4 years farrowing 2 litters annually, raising 7 pigs per litter, the total cost of a 225-lb. pig is 24.16 bushels of corn and of 100 lbs. pork, 10.74 bushels.

These figures by Smith correspond very closely to the actual ratio between the average price of hogs and corn on the Chicago market as reported by Wallace. During the 10-year period, 1908 to 1917, the average price of 100 lbs. live weight of hogs at Chicago was equal to 11.3 times the price of No. 2 cash corn per bushel.

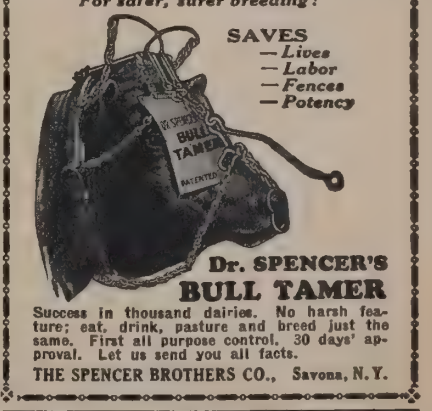
By-products of the Hog

All of us are familiar with the main products of the hog carcass but few are familiar with the edible and inedible by-product portions yielded in commercial slaughter. It is said that the modern pork packing process saves everything but the squeal. This is literally true because uses have been found for every portion of the hog's body.

E. N. Wentworth of the Armour Live Stock Bureau furnishes some facts on the disposal of the hog carcass which are published in Vaughan's "Types and Market Classes of Live Stock."

According to these figures a hog weighing 250 lbs. yields 2.25 per cent or 5.62 lbs. of his carcass in edible by-products; the carcass yields 3.75 per cent of 9.38 lbs. of non-edible by-products; the carcass shrinks 20.5 per cent or 51.25 lbs. in the processes of slaughtering.

The parts listed as edible by-products are leaf lard, liver, heart, kidneys, giblet meat, tongue, cheek meat, jaw meat, brains, prime steam lard, and casings.



The parts comprising inedible by-products are ear drums, first grade brown grease, nasal tips, grindings, viscera, head, pressed tankage, dry blood, hair, and bristle.

Among the edible by-products of the hog are pepsin, derived from the stomach; livers, used in the manufacture of liver sausage; and neutral, a specially prepared lard largely used as an ingredient of oleomargarine. Lard proper is not commonly considered a by-product. Nearly 15 per cent of the live weight goes into lard. Part of this lard is further processed into lard oil used for illuminating purposes and as a lubricant, and into stearin used in the manufacture of chewing gum and soft candies.

The brains are packed in cans, frozen, and offered for sale. Tongues are canned or pickled. Hearts go into sausage. Tails, snouts, and ears are rich in gelatin or glue. Kidneys are canned or frozen. Milts or spleens are used as a feed for growing fishes at fish hatcheries. The intestines are cleaned, processed, and made into chitterlings, a food product to be fried like oysters. Stomachs are used as sausage containers.

The inedible raw by-products are manufactured into glue, soap, glycerine, blood meal, tankage, curled hair, and fertilizer material. Even the rinds from skinned hams and bacon, as well as the back skin of the hog, are utilized for leather. Nothing is wasted.

DAIRY MARKET NEWS

Wisconsin February Butter

Wisconsin co-operative creameries paid producers a net price of 56.8 cents a pound for butterfat in February, according to reports from 73 of these creameries to the Wisconsin Department of Markets. These creameries received an average of 50.5 cents a pound for butter, making a spread of 6.3 cents between the price received for butter and the price paid for fat.

The range in prices paid for fat was from 42 to 62 cents, with the price received for butter ranging from 40 to 51.4 cents. The overrun ranged from 21.5 to 24.2 per cent. Receipts of butterfat averaged 22,419 pounds per creamery.

Twin City February Milk

The Twin City Milk Producers' Association paid $2.50 a hundred for 3.5% milk delivered in St. Paul during February. The Association handled 24,627,770 lbs. milk, of which 53% was surplus.

Cream patrons were paid 59 cents a pound for butterfat in first grade cream during February. This is 7.5 cents above the average price of 92-score butter on the New York market.

March Foreign Butter

The following table of foreign butter prices gives the average of weekly quotations as published by the U. S. Department of Agriculture:

Market	Mar. 1927	Feb. 1927	Mar. 1926
	Cts.	Cts.	Cts.
New York	30.2	51.5	42.8
Chicago	49.4	50.4	41.5
Copenhagen	36.7	39.2	38.8
Berlin	37.2	39.1	
London:			
Danish	39.3	41.4	41.4
Dutch*	38.9	42.9	41.3
New Zealand	33.7	37.4	37.5
Australian	33.0	35.9	36.3
Argentine*	32.2	34.1	33.1

*Unsalted butter.

March Condensed Milk

(U. S. Department of Agriculture)

Information regarding prices paid producers during March is based on reports made by condensed and evaporated milk firms operating approximately 98% of the total factories in the United States:

Geographic section	No. of factories	Price per cwt. Range	Ave.
New England	1	$2.30	$2.30
Middle Atlantic*	13	2.37—2.61	2.45
E. No. Central	86	1.95—2.36	2.21
W. No. Central	6	1.97—2.30	2.11
North Western	7	1.58—2.13	1.98
South Western	10	1.91—2.20	2.02
United States	123	1.58—2.61	2.20

*Fifty-three additional factories reported prices to be based in part on the current month's wholesale butter quotation. Twenty factories reported prices not determined as yet and 20 reported plants closed.

Manufacturers' wholesale selling prices for sweetened condensed and unsweetened evaporated milk were as follows for February:

	Range	Ave.
Condensed, per case	$5.34— 6.30	$ 5.92
Condensed, per cwt.	9.28—13.00	10.39
Evaporated, per case	3.80— 5.05	4.34
Evaporated, per cwt.	7.50— 9.50	8.68
Condensed skim, per cwt.	5.00— 7.00	5.84
Evaporated skim, per cwt.	2.75— 6.45	3.79

Wisconsin March Condensery Prices

Forty-seven condenseries reported to the Wisconsin Department of Markets the prices paid in March per hundred pounds milk delivered at their factories. Reduced to a common 3.5 per cent test basis, these prices ranged from $2.07 to $2.29, the average being $2.21.

Seventeen factories sent delayed reports for February, the average being $2.32. This is 4 cents above the previously reported average of $2.28 for 40 factories.

March Cheese
